Spons' Architects' and Builders' Pocket Price Book, 1910. 628 pp. 6½ in. by 3¾ in. (London: E. & F. N. Spon.) 3s.

THIS handy little pocket book, which is edited by Mr. Clyde Young, and has been revised by Mr. Stanford M. Brooks, is principally addressed to architects, and is conveniently arranged to provide technical information, quantities, model forms of specification, as well as prices. There is a short electrical section, which has been brought up to date by the insertion of an extra slip with the latest prices and sizes of metal filament lamps. The general notes on supply and lighting are thoroughly practical, and are followed by an example of a detailed specification for an electric light installation with oil engine generating plant at a large country house, which, although based on the use of carbon lamps, will be useful in planning metal filament lamp installations. Extracts from the wiring rules of the Institution of Electrical Engineers are also given.

The Electrical Engineering Laboratory at Oxford.—The Electrical Engineering Laboratory at Oxford University, which has been presented by the Drapers' Company, was opened last week. The cost of the Laboratory has been £23,000.

FUSES AND THEIR STANDARDISATION

AT a meeting on Wednesday, May 25th, of the Birmingham Section of the Institution of Electrical Engineers, Mr. H. W. Kefford read a Paper in which he described a series of experiments on fuses of commercial types, and considered the question of the standardisation of fuses and the relative merits of various patterns. In dealing first with the relations between the rated and normal fusing currents of a fuse, he gave a typical diagram showing how the curve of time intervals after switching on plotted on a current base was asymptotic to an ordinate representing the limiting current which theoretically would cause the fuse to blow if applied for an infinite period. He suggested, however, that for practical purposes four hours should be taken in defining the limiting current, and put forward the following way of defining the rated current:—

A fuse which is rated at R amperes must fuse within four hours when carrying a times its rated current, but must be capable of carrying $a-\alpha$ times its rated current for at least four hours without fusing. If L amperes is the limiting current, the rated current R amperes must lie between $\frac{L}{a}$ and $\frac{L}{a-\alpha}$.

The values chosen for a and $a-\alpha$ depend on a large number of practical considerations. The wiring rules of the Institution of Electrical Engineers require that no fuse shall carry more than 200 per cent. overload without fusing (*i.e.*, $a=3{\cdot}0$), whereas the rules of another recognised authority in this country restrict the permissible overload to 50 per cent. ($a=1{\cdot}5$). The writer has recently heard of suggested modifications to the overload regulation from two independent sources, one of which was a proposal to permit an overload of 300 per cent. ($a=4$), while the second authority was of the opinion that the permissible overload should be even less than 50 per cent. if manufacturers could work to a narrower limit. The regulations for enclosed fuses by the Underwriters Association in the United States, which have been framed with the co-operation of manufacturers, fix the values of a and $a-\alpha$ at 1·25 and 1·10 respectively, but these figures were only decided upon after manufacturers had endeavoured to work to a smaller value of a than 0·15.

With a view to determining the possible values of a and $a-\alpha$ and the limit between which the ratio of the limiting and rated currents must lie, a number of tests were carried out on a representative collection of fuses in common use, of which full results are given in the Paper. These tests include the investigation of voltage drop and watts lost in fuses, and it is pointed out that, owing to the greater voltage drop on small fuses, it may be desirable to increase the value of a in a range of fuses as the normal working current diminishes.

In the case of fuses of the totally enclosed type, we have also to consider the effects of the increased cooling facilities and capacity for heat of the fuse enclosure. Owing to the large radiating surface, the size of wire for a given limiting current is reduced, and the drop of volts may therefore become large if the length of the fuse is not reduced or a metal adopted which has a low melting-point. If the fuse is very short, on the other hand, conduction and dissipation of heat from the terminals will play an important part and exercise a similar influence in increasing the voltage drop and power loss. In order to reduce these two quantities to economical and safe limits, it becomes necessary to rate the smaller fuses at a lower percentage of the limiting current. Since well-designed fuses of the enclosed type may be made very much shorter than a corresponding open-type fuse for the same voltage, advantage should be taken of this possibility in order still further to reduce the losses; the alternative course of using a low melting-point metal is far inferior, and the larger volume of metal required may prove a source of danger. The value of a recommended for copper fuses is 2·0, and for silver fuses 1·43, and the author considers that these are the only two suitable metals for standardised fuses.

A number of cases of faulty construction revealed by the tests are mentioned. For example, in one case the copper fuse wire remained intact, while it was the soldered connection that gave way on overload. In another series of fuses of the totally enclosed or cartridge type, rated for over 500 volts maximum pressure, a solid single link of soft fusible metal is used, containing a volume of metal nearly fifteen times as great as that contained in another make of cartridge fuse of the same rating. This protective device is completed as an explosive of a most dangerous kind by the provision of a number of vent holes in the metal cap at each end. The behaviour of these fuses on short circuit was of a violent description.

The author favours the use of enclosed cartridge fuses, particularly those in which means for non-interchangeability of sizes is provided. Bare wire fuses are objected to on account of their liability to scatter molten or hot metal, and the rapidity of corrosion unless certain non-active metals are used. On the other hand, with enclosed fuses, the fuse wire is less liable to corrode or become injured, and therefore enclosed fuses lend themselves to more exact calibration. Tampering with the fuse wire is also difficult, and a system of non-interchangeability is greatly facilitated.

If properly designed no molten or hot matter can be thrown about, and good operation can be obtained on heavy overloads at full voltage. Also less metal is required, and the weight and size of the complete fuse fitting is reduced.

The following points are put forward as essential to the satisfactory operation of any fuse whether of the open-wire, tubular, or totally enclosed type: The volume of fusible metal should be reduced to the minimum compatible with correct rating and moderate temperature rise. The fusible metal should be subdivided so that the ratio of exposed surface to cross-section does not fall below a figure depending on the design. The provision of cooling arrangements adequate to extinguish the arc formed on overload. In exposed wire fuses the provision of sufficiently free expansion space to prevent explosion when a short circuit occurs. In enclosed fuses the same end must be attained by precisely opposite means, and no opening or weakness of any kind is permissible in the enclosing case.

It is unfortunate, continues the author, that instead of attacking the problem of an enclosed fuse in an appropriate manner, some designers have considered that the simple enclosure of an open-type fuse would produce the desired end. Provided that subdivision is properly carried out and efficient means of cooling the arc are employed, a small fuse is far safer and more efficient than a much larger or longer fuse containing a considerable volume of metal, all of which may be vaporised on a short circuit. From this same point of view, the use of soft metals such as tin, lead, or zinc is to be deprecated, although with very careful design successful use may be made of the non-arcing property of the last-named metal. The means at disposal for cooling an arc and condensing the vapours are three in number: by mechanical draught, by the surface condensation and cooling action of masses of porcelain, metal, or asbestos, and by the analogous use of an absorptive condenser in the form of filling powder. When the last method is adopted it is important that the fuse wire and filling should be free from any mutual chemical action even when subjected for a long time to alternate heating and cooling. Fillings containing a capsule of liquid, or any hygroscopic or moist substance are bad in principle, and may be the cause of violent explosion or of chemical corrosion of the fuse wire. Tests carried out on a very large number of filling materials lead to the conclusion that the most suitable for use in enclosed fuses are thoroughly dry uniform powders of completely inert substance.

Finally, the author gives the following suggestions as a basis for the discussion of a specification for standard fuses:—

The fuse wire must not corrode or permanently change its conductivity or physical structure. Fuses up to 50 amperes rated current should be provided with a simple arrangement by means of which the capacity of the fuse which can be inserted by a non-technical user is restricted within definite limits. An enclosed cartridge type of fuse is recommended. All fuses must be provided with a simple means for detecting fusion simply by inspection of the fitting.

The rated current marked on the fuse shall bear a definite relation to the limiting current or least current which will produce fusion within four hours. The minimum value of the ratio of the limiting current to the rated current shall be 1·54, and the maximum value shall not be higher than 30 per cent. above the minimum. In a correctly proportioned line of fuses a should decrease from the maximum to the minimum values specified, as the size of the fuse increases from the lowest to the highest capacity. This regulation is based on the assumption that silver is the best metal for fusible links, taking into consideration its permanent character, the small volume required, and its "clean" action when breaking the circuit. Standard fuses shall be so rated and constructed that when loaded with 50 per cent. above the limiting current they will fuse within one minute. The actual time required for fusion shall be taken as a measure of the "time element" of the fuse.

Every fuse shall be clearly marked with its rated current and the maximum voltage for which it is suitable. The standard rated currents and voltage suggested are as follows:—

Maximum Voltage, 250.—2, 4, 6, and 10 amperes.

Maximum Voltage, 500.—2, 4, 6, 10, 15, 20, 30, 40, and 50 amperes.

When loaded continuously with 80 per cent. of the limiting current no exposed part of any fuse fitting shall attain a temperature exceeding 100° C. above that of the atmosphere.

Digitized by Google

Fuse fittings shall be tested for insulation between terminals with the fusible portion removed and between the live parts and "earth" with the fusible portion in place. Fuses shall be tested for satisfactory operation on overload and short circuit in accordance with the specified arrangements for carrying out such tests.

At the end of the evening Mr. H. W. Kefford gave an interesting demonstration by the kind permission of Dr. Gisbert Kapp. Three experiments were made. (1) To show there is practically no extra rush of current when switching on a lamp circuit: The circuit of 18-32 c.p. lamps, protected by a Siemens cartridge fuse, was arranged so that each lamp and the whole circuit was under the control of switches. Starting with 14 lamps in circuit, the number was increased by one lamp at a time to 17, and at each step the whole circuit was alternately made and broken two or three times. Then, while the current was on with the 17 lamps in circuit, the 18th was added when the fuse went. (2) To show the necessity of care in choice of a fuse to work in atmospheres containing explosive gases: A small gasometer was filled with a mixture of coal gas and air, in which was arranged on separate circuits an ordinary tubular fuse and a Siemens' cartridge fuse. On blowing the cartridge fuse, no effect was produced, but on the breaking down of the tubular fuse a violent explosion occurred. (3) A 4a and a 6a cartridge fuse were arranged in series, and by suitable adjustment of resistance in circuit the 4a fuse was blown, leaving the 6a, thus demonstrating the possibility of rating fuses with reasonable accuracy.

NATIONAL TELEPHONE CO.'S STAFF DINNER

THE sixteenth annual staff dinner of the National Telephone Co., Ltd., was held on Thursday last at the Trocadero Restaurant, London, Mr. Albert Anns, Secretary to the company, in the chair. There was an attendance of close on 300 members of the staff and their friends, and besides those who spoke there were present Lord Harris, Sir John Gavey, Sir Alexander Kennedy, Major O'Meara, and also Messrs. W. A. Smith, A. M. J. Ogilvie, A. H. Norway, F. Gill, S. J. Goddard, and other prominent members of the staff.

After the loyal toasts had been honoured, the Chairman, Mr. Albert Anns, proposed the toast of the National Telephone Co. He first referred to the unavoidable absence of the Postmaster-General, the Assistant Postmaster-General, and the Secretary to the Post Office, Sir Matthew Nathan, on account of the fact that the Post Office Estimates had been fixed for discussion in the House of Commons that night. With regard to the coming transfer, the rumours of an earlier settlement had come to naught, and both parties were busy preparing for the fight. He estimated that the cost would not run far short of £100,000 before the matter was settled. Though the service was still steadily increasing, the capital expenditure during the past year had been about half what it was two years ago. The revenue was increasing, and the prospects from the shareholders' point of view were very bright. They were not so bright from the staff's point of view, however; the reduction in expenditure had meant that many hundreds of their employees had been obliged to seek employment elsewhere. That competition ended in combination seemed particularly true of the telephone business; only Hull and Portsmouth remained now. The transfer was a very big transaction; over half a million clients bringing in a revenue of between 3½ and 4 million pounds a year would be handed over. These assets would be valued for the purpose of the transfer, but the assets represented by the brains, energy and devotion of the staff would not be. The President and the other members of the Board regretted that they could not give any assurances, but they hoped that matters would have a happy issue. He congratulated the Staff Transfer Association on the work they had done. He understood that one of the most important points at issue was whether the Government would include the number of years spent in the service of the Company when reckoning up the years of service in connection with pensions, &c. He had no doubt that some satisfactory arrangement would be come to.

In responding for the Company, Mr. George Franklin, President of the Board, stated that the transfer would involve considerations of the highest importance and the utmost delicacy. He was sure that the Post Office would be able to count on the loyalty of the staff, and that they would continue to show the same zeal and ability as they had done for the company. It would be a great day for the Post Office when the 18,200 odd servants of the Company were taken over. The Company had not been idle during the past year; 52,153 new stations had been added, bringing the total up to 516,888 stations connected. The number of exchanges now numbered 15,069, fourteen having been added during the year. A total of 13,062 million messages had been dealt with during the year, the average cost per message being 0·51d. We stood well as compared with other countries; we had one telephone for every 77 of the total population; Germany had one for every 71; France had one for every 202; Italy one for every 625. There never was a time when the staff was more efficiently organised, and he would like to express the sincere appreciation of the Board of their work. They intended to keep the plant and business of the concern at concert pitch until the time of transfer eighteen months hence. It would be an anxious time for all concerned, but he was certain that justice would be done alike to staff and shareholders.

Mr. C. B. Clay proposed the toast of the visitors, and referred to the proposed continuation of the dinners of the Company's staff after the transfer. The toast was responded to by Sir Albert K. Rollit in a characteristic speech, and by Sir Robert Hunter. Mr. A. E. Ruddock proposed the toast of the Chairman, and Mr. Anns replied briefly.

AN ELECTRICALLY DRIVEN THIMBLE WORKS

THE old-established Iles Thimble Works, Birmingham, has recently been forced, by the keenness of foreign competition, to realise the possibilities of electric driving. The firm decided to throw out the gas-engine plant, and to equip electrically their whole works. The contract was placed in the hands of the British Westinghouse Electric & Manufacturing Co., Ltd., and as a result, not only have the power costs been considerably reduced, but the great convenience of the electric drive been fully realised.

It is interesting to follow the thimble through the various stages of manufacture. The different metals used are taken from the warehouse to the punching department, where blanks are cut out from the thin sheets. These blanks are then taken to the machine shop, where they are formed roughly into shape by passing them through two sets of dies. This shop is driven by a 7-h.p. Westinghouse shunt-wound motor, running at 830 r.p.m., which operates the lathes, presses, and small grating machines from a shafting running the whole length of the building. The rough thimbles are next taken to the raising department, where they are put into hand-operated presses, and given the correct shape, and from there to the finishing departments, of which there are two, one which is operated by a 4-h.p. Westinghouse shunt-wound motor is used for finishing off steel thimbles, and the other, driven by a similar motor, for aluminium ones. In this department, the thimbles are grated, machined inside and on the edges, and then sent to the annealing department. The next operation is carried out in the dipping shop, where they are cleaned in an acid solution, and then, should they require silvering, they are passed to the silvering vat, before being put into which, however, they are dried in a rotating barrel, containing sawdust. From here they pass to the polishing room, which is operated by a 1½-h.p. Westinghouse motor, and to the inspection and store rooms.

The manufacture of celluloid thimbles is a distinct branch of the business, and is carried out in a separate building. These thimbles are made from solid celluloid rods of about half-inch diameter, which are first cut into lengths of about three-quarters of an inch, and then heated with hot water for a few minutes, from which they are taken and moulded into shape and size in a small press. These rough thimbles are then put into the drying chamber for from 10 to 15 days, and when they are sufficiently hard, taken to the finishing department, where they are machined inside and finished in small lathes. In this department celluloid finger shields are also made in thousands a week. The power necessary for operating this building is small, and a 3-h.p. Westinghouse motor is ample for the work.

This firm manufacture a number of thimbles lined with celluloid, and their most recent patent is for ventilated thimbles. It does not confine itself only to the manufacture of thimbles, but also makes fancy boxes for enclosing them, and cardboard boxes in a special department. Here the guillotine, marking, and cornering machines are driven from a shafting running the length of the building, and operated by a 5-h.p. Westinghouse motor placed on the floor. Beside the motor is its control gear, which is mounted on the wall.

Aeronautics at the Northampton Institute.—The silver medal offered by the Women's Aerial League to the best student in the pioneer courses in aeronautics, held during the session 1909-10, has been awarded to Mr. Duncan George, Mr. E. R. Moffat being *proxime accessit*. Extended courses of a more complete and practical nature are being arranged for next session under Mr. F. Handley Page, and there is under consideration the establishment of full-time day courses in aeronautical engineering extending over four years, and similar to the well-known day courses in electrical and mechanical engineering.

Bogus Tramway Accidents.—A somewhat unusual charge was heard at Bow Street on Tuesday, when a paperhanger named George Weller, was charged with falsely representing that he had sustained personal injuries upon a tramcar belonging to the Metropolitan Electric Tramways, Ltd., and for claiming compensation. It appears that the man was suffering from some injury to his wrist, and had an out-patient's card from the Great Northern Hospital. About a fortnight ago he travelled on top of a tramcar from Stamford Hill to Finsbury Park, and asserted that he had tripped over a damaged slat on the roof and hurt his wrist. He produced the hospital card and wrote to the Company claiming £5 10s. compensation. The date on the card showed signs of having been altered, and as the result of enquiries the prisoner was arrested. The case was remanded.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ACCUMULATORS.—The latest list of the Chloride Electrical Storage Co. (39 Victoria Street) gives a very good idea of the completeness of the range of styles and sizes of cells supplied by this company, and includes particulars of various accessories, spares, testing apparatus, &c.

DYNAMOS AND MOTORS.—We have received from the India Rubber, Gutta Percha & Telegraph Works Co., Ltd., an attractive and well-arranged list of their standard four-pole motors and dynamos of the open protected, enclosed ventilated, and totally enclosed types, up to about 80 b.h.p. Speed outfits are standardised for 110, 220, 440, and 500 volts, and a complete telegraphic code for ordering is included.

INSTRUMENTS.—We have received from Messrs. Elliott Brothers (Century Works, Lewisham) a collection of leaflets which they have recently issued. These deal with moving coil switchboard instruments of the round and edgewise patterns, current and potential transformers, Mr. Haydn Harrison's well-known portable flicker photometer for street illumination, &c., the Elliott five-dial universal shunt and Wheatstone's bridge, the Robbins station-keeper for naval purposes, the Wimperis accelerometer and gradient measurer, detectors and galvanometers of various patterns, testing keys and switches, distance and speed recorders for ships, and drawing instruments.

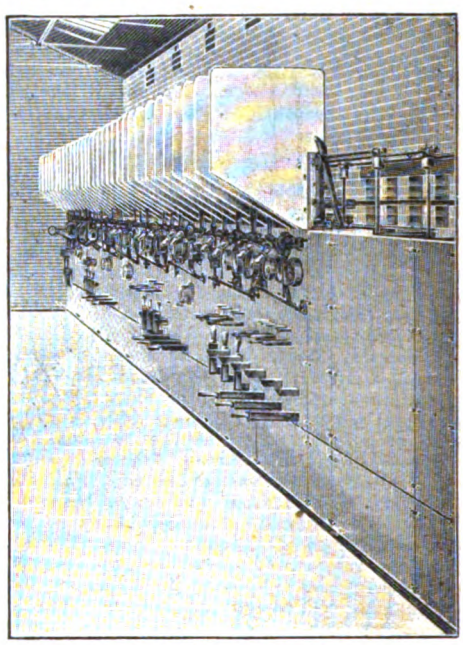
STORAGE BATTERY INSTALLATION.—A pamphlet from the D.P. Battery Co., Ltd. (Lumford Mills, Bakewell, Derbyshire), describes a storage battery installation recently put down by the firm at Messrs. Rowntree and Co.'s Works, York, for steadying the voltage of the steam and gas-driven stations and providing a standby supply. The battery is of 112 cells, capable of a discharge of 800 amperes for 1 hour, and is used in conjunction with a fully automatic reversible booster made by Messrs. Crompton and Co.

DYNAMOS AND MOTORS.—A list from the British Thomson-Houston Co., Ltd. (Rugby), gives particulars of the company's latest standard series of dynamos and motors ranging from 27 h.p. to about 125 h.p., which, we understand, have been entirely redesigned. These machines can be fitted with various styles of covers, rendering them flame-proof, dust-proof, and moisture-proof, and they can thus be installed for tool-driving where small chips of metal are liable to drop into the motor, for tool-driving in exposed positions where rain may beat into the motor, for operating paint-mixing machines, pumps, &c., where the motor would be liable to splashes of paint or water, or for driving wood-working machinery, coal hoists, &c., where dust is likely to enter the motor. They can also be supplied fitted with a fan. All the sizes can be obtained with split frames if desired, and commutating poles are used in the case of some of the higher voltages, and outputs and speeds are given for more than a dozen standard voltages. The general design of the machines is on most modern lines; laminated poles are used bolted on to the cast-iron frame. The outputs are based on 40° C. rise after six hours.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

CONCENTRIC WIRING.—Messrs. Siemens Brothers and Co., Ltd. (Caxton House, Westminster), have brought out a new pamphlet on their O.S. system of wiring. This consists of a more or less popular description of this method of wiring, and includes illustrations of actual surface "Stannos" runs, as well as a series of pictures of all sorts of buildings that have been wired with "Stannos." It has been prepared chiefly for architects and prospective consumers, and in this connection should form useful propaganda for electrical contractors, station engineers, and others. An accompanying pamphlet describes some recent installations of concentric "Stannos" wiring at certain Cambridge colleges, where the nature of the architecture and decorations were able to be negotiated inexpensively and neatly by this system of wiring.

SUPPLY ADVERTISING.—We have from the Electricity Supply Publicity Committee of London and District (Moorgate Court, E.C.) a copy of the very effective coloured poster showing a lady using an electric iron, which is to be used to call attention to this particularly attractive domestic use of electric supply which has so often led to other applications of electricity.



FLEXIBLE COUPLINGS.—A very ingenious spring coupling known as the pillow flexible coupling, which can be insulated or non-insulated is described in a leaflet issued by C. E. Lugard & Co., of Chester.

ACCESSORIES.—A new list of accessories for electric light installations is being issued by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.) This embraces a considerable variety of tumbler and other switches, combined switches and plugs, ceiling roses, wall and floor sockets, lamp-holders, simple fittings, fuses and distribution boards, and other installation material.

METAL FILAMENT LAMPS.—A revised list from Siemens Brothers Dynamo Works, Ltd., gives the latest reduced prices of the complete range of tantalum lamps now on the market, with sizes of the new series of standard bulbs in which they are now supplied.

INSULATING MATERIALS

THE following particulars of the insulating materials manufactured by the firm of H. Weidmann (Rapperswil, Switzerland) are of interest. A speciality of this firm is a high quality non-hygroscopic press-spahn, the surface of which is treated in a special manner. The results of tests by the Physikalische Reichsanstalt have shown that a sheet of this material 0·25 mm. thick has a breakdown pressure of 3,000 volts A.C. It is supplied in sheets of thicknesses varying between 0·1 and 15 mm., and also in rolls of strip which are convenient where pieces of varying length are required. Several different widths between 15 and 500 mm. can be obtained; the total length of one roll is between 50 and 200 metres according to the thickness. The thicknesses lie between 0·1 and 1·0 mm. in the case of the rolls, which are especially suitable for slot insulation, cables, and for the strip insulation required between long copper bars and under armature binding wires. Special forms of press-spahn, impregnated with oil or paraffin, or with intermediate layers of mica, are also manufactured. The firm informs us that a cheap kind of glazed pasteboard has been introduced under the name of "press-spahn," but that this is far inferior to the genuine press-spahn, for the manufacture of which comparatively costly raw materials are required.

ASBESTOS-CEMENT SEPARATING SHIELDS FOR SWITCHGEAR.

Other specialities of this firm are tubes of press-spahn with or without the addition of asbestos or mica. Transformer-winding cylinders, rings, discs, and various special moulded pieces of the same material are supplied. Articles of mica compositions, micanite, &c., are manufactured at the firm's works, where a large plant, including several special presses, is installed. Cornite is a special material for high-tension switchgear, and withstands temperatures of 300° C. or more. Asbestos-cement and amianite are materials suitable for magnet-coil frames; a switchboard with separating shields of asbestos-cement is illustrated in the accompanying figure. Pyrostat, vitrite, and pierrite are heat-resisting insulating materials, especially prepared for use in the construction of electric ovens and furnaces.

THE POSTMASTER-GENERAL'S ANNUAL STATEMENT

In the House of Commons on Thursday, Mr. Herbert Samuel, the Postmaster-General, made his annual statement on the vote for the sum required for salaries and expenses of the Post Office, telegraphs and telephones. The sum necessary is £19,828,256, and this was compared with £10,000,000 fifteen years ago. Dealing with the Post Office telephone undertaking, Mr. Samuel said that 123 new exchanges have been opened during the past year, and the number of subscribers has increased by 12 per cent. The number of conversations on the trunk lines increased by 15 per cent., and in view of the coming acquisition of the National Telephone Co.'s business, two Departmental Committees were at work, one dealing with the question of telephone plant, and the other with the details of the transfer, especially in relation to taking a general inventory

Digitized by Google

of the Company's plant. He had very small hope that the terms of purchase would be arranged otherwise than by arbitration, and it was proposed to introduce a Bill at the beginning of the next session to deal with the necessary finance.

With regard to wireless telegraphy, the purchase of the Marconi Co.'s and Lloyd's stations had been amply justified by the result. An enquiry was now being held as to the distribution of the stations around the coast, and also in relation to installing new ones in such places as Newcastle and other districts, which at present have no wireless telegraph communication. In this way it was hoped to complete a ring of stations around the coast and parts of Ireland, which would undoubtedly be of the greatest service to ship owners.

After several years of declining receipts, the Telegraph Department has begun to show some expansion. The sum of £2,000,000 has been spent in laying underground cables in various parts of the country, to avoid interruptions from storms, and a considerable amount is included in this year's estimates for further extensions of the underground system.

Dealing with the sensational statements which have been published in the daily press as to the effect of telephone exchange work upon the physique of telephone operators, Mr. Samuel characterised the figures which have been quoted as grossly exaggerated, which, on investigation, required to be divided by two or three, and sometimes ten, in order to get the truth. At the same time, it is recognised that the work of a telephone operator does impose some strain upon the nervous system, and his predecessor, Mr. Buxton, had caused an enquiry to be made into the question. The Committee which carried out investigations had reported during the past two days, and he had given instructions for the recommendations of this report to be regarded as a matter of urgency. The Committee recommend certain alterations in the allocation of hours, intervals for meals and rest, and some small improvements in the instruments.

During the lengthy debate which followed the Postmaster-General's statement, apprehension was expressed as to the possibility of increased rates when the National Telephone Co.'s undertaking was acquired. In answer to questions raised the Postmaster-General said he would give no pledge as to municipal powers in relation to telephones. Every effort would be made to acquire the National Telephone Co.'s undertaking on the best conditions for the public, with no payment for good-will.

LOCAL NOTES

ABERDARE: *Tramways.*—The Council propose to promote a Bill in the next session of Parliament for the construction of an electric tramway.

BELFAST: *Tramway Accounts.*—The tramway revenue for the past year amounted to £203,875, and the working expenses to £107,335, or 52·62 per cent. of the gross revenue, as against 55·87 per cent. in the previous year. The net profit was £46,296. The receipts for the year show an increase of £8,831, and work out at 9·65d. per car-mile.

BOURNEMOUTH: *The Conduit System.*—Before actually applying to the Board of Trade for consent to abandon the conduit system in Bournemouth, and substitute the overhead trolley system, the Council has decided to ask Mr. A. L. C. Fell, Chief Officer to the London County Council Tramways, to report upon the matter generally.

BURY: *Damages for Tramway Accident.*—At the Manchester Assizes last week a machine-minder, named Walter Hoyle, sued the Corporation for damages for personal injuries sustained in a tramcar accident. It was stated in evidence that the plaintiff, who is a heavy man, was on the point of boarding a car when it suddenly started and jerked him backwards into the roadway, fracturing his thigh. For the defence it was alleged that the plaintiff slipped on the greasy setts whilst he was still some yards away from the car. Judgment was entered for the plaintiff with £500 damages.

CARDIFF: *Tramwaymen's Wages.*—The motormen and conductors on the tramway system have asked that their wages should be increased to a maximum of 7d. per hour and 6½d. per hour respectively, compared with the present maximum of 6½d. and 5¾d. A sub-committee has been appointed to meet the tramwaymen's representatives.

CARLISLE: *Charges against Electrical Engineer.*—Certain charges made by Councillor Eggleston at the last Council meeting, reflecting very seriously upon the management of the electricity undertaking, have been investigated by the Electricity Committee, who report they are satisfied that the charges are untrue and have no foundation. The Council is recommended to call upon Mr. Eggleston either to substantiate the truth of the charges or to unreservedly withdraw them.

CHESTER: *Electricity Supply.*—The net profit upon the electricity undertaking for the past year was £2,046, compared with £1,858 in the previous year. In presenting the accounts at the last meeting of the Corporation, the Chairman of the Electricity Committee stated that during the past few years the revenue account of the undertaking had provided extensions, alterations, and improvements amounting to £7,922.

FLEETWOOD: *Street Lighting.*—The Electrical Engineer has been directed to prepare an estimate of the cost of lighting all the streets in the town with electricity instead of gas.

GLASGOW: *Tramway Profits.*—A ratepayers' meeting was held last week, at which a protest was made against the decision of the Corporation to apply the tramway surplus to relief of rates.

HARROGATE: *Street Lighting.*—It has been decided to charge 17s. per annum for the five hundred 50-c.p. metal filament lamps which are to be installed for street lighting.

HASLINGDEN: *Electric Supply.*—A recommendation by the Electric Lighting Committee that the Council should put their Provisional Order into force has been referred back.

HINDLEY: *Electric Lighting.*—The Council's Electric Lighting Provisional Order expires this month, and an extension of time is to be applied for.

HULL: *Electricity Accounts.*—The total revenue from the electricity undertaking for the past year was £54,000, and the net revenue £27,000. The income from lighting increased by £585, whilst the revenue from power supply was greater than that of the previous year by £2,500. The number of units sold was 6,346,007, against 5,723,074 in the previous year, and the total cost of generation, including capital charges, was 1·83d. per unit.

LEICESTER: *Management of Electricity Undertaking.*—The Corporation are considering the advisability of separating the management of the electricity undertaking from the gas undertaking. It will be remembered that the late Mr. Colson was both gas and electrical engineer.

LEIGH: *Electricity Charges.*—At the last meeting of the Council, when the Tramways and Electricity Committee's proceedings came up for approval, Councillor Ashworth suggested that the charges for electricity should be increased. To make a profit of only £112 on a capital expenditure of £40,000 or £50,000 was not, he said, satisfactory. According to the accounts the generating costs were 1·37d. per unit, and the average price for power was 1·32d. He suggested that the charges should be so revised that the average price for power should not be less than 1.45d. No other Councillor took the point up, and the matter was dropped.

LINCOLN: *Electricity and Tramway Accounts.*—The Electric Lighting Department has made a gross profit for the year of £6,493, leaving a net profit of £2,503, after meeting capital charges. Out of this, £44 is to be used to meet the deficit on the tramway account, and £2,459 carried to depreciation. It is stated that the running cost of the tramways is considerably below the average of other undertakings in this country, and the small deficit is mainly due to the shortness of the line.

LONDON: *London County Council: Tramway Accounts.*—The Highways Committee have presented a statement of the accounts of the tramways undertaking for the year to March 31st, 1910. The system now has a total length of 135½ street miles, of which 20 miles are horse lines. The whole system is worked by the Council, with the exception of 1⅝ miles in the Harrow Road and ⅜ mile in Archway Road, Highgate, which are worked by the Metropolitan Electric Tramways, Ltd., and ⅜ mile in Lea Bridge Road, which is at present worked by the Leyton Council. Capital expenditure amounts to £10,709,504, of which £1,225,942 were expended last year. The total receipts during the year from electric traction were £1,891,035, and from horse traction £131,967. There was a loss on the horse undertaking of £45,172, and a surplus on electric working of £834,208. The gross surplus was, therefore, £789,036. After meeting capital charges, income tax, Parliamentary expenses, &c., there is a surplus of £192,109. Provision for renewals at the rate of ¾d. per car-mile, plus a small amount to meet shortage in previous years, leaves a sum of £58,868, which has been transferred to the general reserve. This fund now amounts to £70,752, after deducting £25,265 special expenditure in connection with the surface-contact tramways in the Mile End Road. The total expenses per car-mile were 7·15d., against 7·37d. in the previous year. The surplus on working is 5·06d. per car-mile.

The London County Council propose to serve notice upon the Metropolitan Electric Tramways, Ltd., of their intention to purchase the line between Finsbury Park and the Manor House. The position in connection with the line is interesting. The boundary line of Middlesex and London is down the centre of the roadway, with the result that one pair of rails belong to the London County Council, and the other pair of rails to the Middlesex County Council. In order to avoid a deadlock, terms were arranged under the L.C.C. Tramways Act, 1906, by which the L.C.C. was to acquire the other pair of rails.

Battersea.—The Electrical Engineer has reported the results of trials which have been made by him in the use of carbon brushes in place of wire gauze brushes for the turbine generator sets. The results have proved, he says, that by adopting carbon brushes the machines are more reliable and efficient, and the committee has decided that the necessary works

Digitized by Google

be carried out for providing and adapting the gear for carbon brushes to the remaining turbine generator sets at an estimated cost of £85 10s

Poplar: Systems of Charging.—In March, 1909, the Council approved experimentally the wiring of 25 houses at a tariff of 12½ per cent. on the cost of installation to cover depreciation, repairs, and interest, with a charge of £4 per annum per kw. installed, and £1 per kw. installed for heating, &c., plus ½d. per unit for all current consumed; lighting in cellars, lavatories, &c., not extensively used at the time of the maximum load being charged at the same rate as for heating. The Committee are now of opinion that this class of installation may be usefully extended. It is also suggested that in the case of business premises a charge of £15 per annum per kw. for inside lighting, and £6 10s. for outside arc lighting, plus ½d. per unit is to be made. For power consumers it is proposed to establish a general rate of £4 per kw., plus ½d. per unit for all current consumed, and to offer rebates to large consumers. The Engineer has come to the conclusion that the scale of charges proposed would materially assist the undertaking in further development, and reach the class of consumer to whom the present rates appear to be prohibitive, while at the same time allowing a sufficient margin of profit to meet depreciation. The Engineer has been authorised to wire a number of premises, not exceeding 50 for domestic and business supplies on these terms, at a cost not exceeding £20 for any one installation. The Finance Committee are to report upon the proposal.

MONAGHAN.—It is understood that the scheme for the lighting of this town by electricity has not been dropped, and that another public meeting will be held at an early date.

NELSON: *Tramway Supply.*—The offer of the Burnley Corporation of 2d. per Board of Trade unit for electricity supplied to Brierfield tramways has been accepted.

PENMAENMAWR: *Street Lighting.*—After considerable discussion, the Council has decided to adopt electric lighting on the promenade.

PLYMOUTH: *The Trolley Omnibus.*—The Tramway Manager has prepared a report upon the trolley omnibus, in which he describes the various systems available. He expresses himself favourably impressed with the experimental line at Hendon, and is convinced that whenever the Plymouth Council considers the question of communication with certain of their outlying districts, the trackless trolley system will be very suitable. Consideration of the report has been deferred.

Tramway Accounts.—The receipts from the tramway undertaking last year amounted to £36,638, and there is a gross profit of £10,127. After meeting capital charges there is a net profit of £850.

PORTSMOUTH: *Telephone Accounts.*—After meeting capital charges, the telephone accounts for the past year show a surplus of £400.

RUGBY: *New Electric Supply Agreement.*—The Electric Light Committee have obtained more favourable terms from the British Thomson-Houston Co. with regard to the supply of electrical energy, and as a consequence the agreement with the company, which would have expired in 1915, has been extended to 1918.

SOUTH AFRICA: *Electric Supply in Durban.*—According to the *South African Mining Journal*, amalgamation proposals have been put forward affecting the two generating stations in Durban. The proposals will provide for the taking over by the Corporation of the railway power station. If the idea is carried into effect, two new generating sets will be installed.

STALYBRIDGE, HYDE, &c.: *Joint Boards' Accounts.*—The accounts of the Stalybridge, Hyde, Mossley, and Dukinfield Joint Boards for the year to March 31st show a loss on the tramway undertaking of £6,448, and on the electricity account of £469.

STIRLING: *Electricity Accounts.*—There was a net profit of £718 on the working of the electricity undertaking last year.

TOTTENHAM: *Street Lighting.*—The Council has received a letter from the North Metropolitan Electric Power Distribution Co. in regard to street lighting. The company asked to be allowed to submit a tender for a minimum of five years for the whole district, but stated that if they might tender only for those portions where the mains were already laid, they would do so for a minimum of three years.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ALDERSHOT.—An inquiry was held last week concerning a loan of £1,500 for electrical extensions.

BARKING.—A sub-committee has been appointed to consider a report from the Electrical Engineer upon extensions to the generating station.

BELFAST.—Tenders for condensing plant are to be invited by the Harbour Board.

HEREFORD.—An inquiry was held last week concerning a loan of £3,000 for electrical extensions.

LONDON: *London County Council.*—Tenders are invited for the supply and delivery of low-tension cables, cable boxes, &c., at the central car repair depôt (see an advertisement on another page).

Battersea.—A loan of £18,909 is to be applied for for mains.

LUTON.—The Electricity Committee require a boiler, superheater, and mechanical stokers. Particulars from the Borough Electrical Engineer, and tenders by July 6th.

NEWPORT (MON.).—A wooden water-cooling tower, natural draught, is required, having a capacity of 200,000 gallons per hour. Particulars from Borough Electrical Engineer, and tenders by July 8th.

NORWICH.—An inquiry was held last week concerning a loan of £17,783 for electrical extensions. The account is made up as follows:—Exhaust steam turbine and condenser, piping, switchgear, &c., £5,000; centrifugal pump, £200; balancer for mains, £160; coal elevator, £150; alteration to boiler, £70, for Paterson feed-water filter, £203; and mains and services, £12,000.

RAWTENSTALL.—An application is to be made for a loan of £11,000 for electrical extensions.

SURBITON.—The Local Government Board have sanctioned loans of £615 for house services, and a similar sum for meters, repayable in fifteen and five years respectively. The Board have stipulated that the loan expenditure must not include payments for permanent workmen and salaried officials of the Council other than the Clerk for regular work in connection with the loans, not within the scope of the duties of Clerk.

TUNBRIDGE WELLS.—High- and low-tension paper insulated cables are required. Particulars from Borough Electrical Engineer, and tenders by July 9th.

Miscellaneous

BECKENHAM.—An application is to be made for a loan of £5,000 for further free wiring.

NETHERLANDS.—The Dordrecht City Authorities have decided to construct an electrically-driven swivel bridge at a cost of £8,000.

[illegible]ERHAM.—Tenders are invited for the supply of electricity meters of 2, 5, 10, 25, and 50 amperes. Particulars from the Borough Electrical Engineer, and tenders by July 9th.

The Tramways Committee require incandescent lamps, among other stores. Particulars from the Clerk, and tenders by July 9th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.E.—The L.C.C. invite tenders for the wiring and fitting of the second portion of the central car repair depôt (see an advertisement on another page).

PROVINCES.

ABERDEEN.—Extensions by Northern Co-Operative Society (£2,500). Architects, Brown & Watt, 17 Union Tee, Aberdeen.

Works, Links Street (£2,150). Architects, Wilson & Walker, 181 Union Street, Aberdeen.

BELFAST.—The Board of Guardians invite proposals for the carrying out of an electrical installation at the Whiteabbey Workhouse. Messrs. Young & Mackenzie are Consulting Engineers, and plans, &c., can be seen at the Clerk's office.

BRENTFORD.—Heating and other engineering works for the Board of Guardians (£11,500). Consulting engineer, Mr. Dolby, c/o Clerk to the Guardians.

BRIDLINGTON.—Town hall. Surveyor, E. R. Matthews, Bridlington T.C.

The governors of the Bridlington Grammar School invite tenders for an electrical installation on the O.S. system, supply being taken from the Corporation mains. Mr. A. J. Beckett, Borough Electrical Engineer, is advising.

BRISTOL.—Surgical department at infirmary (£70,000). The Hospital Governors.

CHRISTCHURCH.—Workhouse infirmary (£12,000). A. Druitt, clerk, Board of Guardians, Christchurch.

DEWSBURY.—The Batley Carr Council School is to be fitted for electric light. Architects, Messrs. Holton & Fox, Corporation Street.

DUNDEE.—Training college (£60,000). St. Andrew's Provincial Committee.

FARNWORTH.—Electrical fittings will be required for the new secondary school which is to be built here at a cost of £19,000.

GELLIGAER.—Isolation hospital (£8,000). J. Lloyd, builder, Ystrad Mynach.

HASLEMERE.—Church (£7,000). Vicar, St. Stephen's, Portsea.

Digitized by Google

It has been decided to instal electric light in St. Christopher's Church. The matter is in the hands of a local gentleman, Mr. Methuen.

HEREFORD.—Extensions of fruit market (£5,000). Surveyor, Hereford Town Council.

LANCASTER.—Salvation Army Barracks. Lancaster Branch.

MERTHYR TYDVIL.—Theatre. G. S. Valentine, Architect, 19 Charing Cross Road, London, W.C.

MERTON.—Cinematograph theatre. Surrey and Sussex Picture Palaces. Ltd., 27 Coombe Lane, Kingston Hill, Surrey.

MINEHEAD.—Public hall (£3,500). T. W. Andrew, architect, Northwood, Minehead.

NEWCASTLE-ON-TYNE.—Home for Incurable Children. Architects, Shewbrooke & Hodges, 24 Grainger Street, Newcastle.

NEWPORT (Mon.).—Congregational institute. Architect, G. Jackson, 49 Risca Road, Newport, Mon.

NORWICH.—The Education Committee recommend that the Duke Street School should be fitted for electric lighting at an estimated cost of £65.

PENZANCE.—Secondary school for girls. Architect, H. Maldern, Morral Road, Penzance.

POLLOCKSHAWS (Glasgow).—Court-house (£1,500). Architect, W. Nichol, 29 Main Street, Pollockshaws.

PONTYPRIDD.—Cinematograph theatre. Architects, Richards & Kaye, Pontypridd.

SHEFFIELD.—Theatre. Architect, A. Winstanley, Temple Chambers, St. Anne's.

STANLEY (Durham).—Concert hall. I. J. Eltringham, architect, Derwent Street, Blackhill. Builder, P. Duffy, Stanley.

SWANSEA.—Church and lecture hall (£10,000). Arhcitect, G. Moxham, Swansea.

WEST DERBY.—Hospital (£6,000). Mr. Lancaster, architect, West Derby Union, Liverpool. Builders, Kelly Bros., Walton, Liverpool.

YOKER.—Extensions, Halley's Industrial Works (£10,000). Architects, Halley & Neil, Kilbourne Road, Clydebank.

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA (Victoria).—The tender of Messrs. Siemens Brothers & Co. for 1,640 iron telegraph poles (£5,119) has been accepted.

The Chief Commissioner of the New South Wales Government Railways, since his arrival in this country a few weeks ago, has confirmed the provisional order which had previously been given to Messrs. Willans & Robinson, Ltd., of Rugby, for a turbo-alternator and surface condenser of 6,000-k.w. normal capacity. A turbine of the Willans "Impulse-Disc and Drum" type is being supplied for meeting the requirements of the Sydney authorities. Two turbo-alternators of the above capacity are already installed in the Sydney power house.

BELFAST.—Messrs. James Allen, Sen., & Sons, Ltd., have withdrawn their tender for the supply of twenty-two tubular electric light masts for the harbour lighting, and the tender of Messrs. Hind Bros. & Co., at £7 15s. 6d. each, less 2½ per cent., has been accepted.

CARLISLE.—The tender of Messrs. John Laing & Son at £12.305 for extensions to the electricity works buildings is recommended for acceptance.

LONDON: *London County Council.*—The tender of Messrs. Pinching and Walton at £230 19s. has been accepted for the wiring and fitting in connection with the electric lighting of Hammersmith Bridge.

Islington.—The Borough Council has accepted the tender of the Crown Engineering Co., at £155 10s., for a lathe for the electricity works.

Southwark.—The Borough Council has placed an order with the General Electric Co., Ltd., for an 8 h.p. slow-speed motor at £33.

LONDONDERRY.—The Corporation have placed an order for a 400-kw. "Disc and Drum" turbine of the mixed pressure type with Messrs. Willans & Robinson, Ltd., of Rugby. The turbine is intended primarily for working with exhaust steam, but can also be used with high-pressure steam when required.

VENTNOR (I.O.W.).—The Finance Committee recommend the acceptance of a tender by the Electric Light Co. for the improvement of the lighting of the Town Hall by the installation of eighteen 100-c.p. metal filament lamps.

The following tenders have been accepted during the past month by the Government Departments named :—Admiralty Contract and Purchase Department : Fittings, Evered & Co., Ltd.; Gabriel & Co.; General Electric Co., Ltd.; Hawkers, Ltd.: Sir James Laing & Sons, Ltd.; W. McGeoch & Co., Ltd.; Player & Mitchell; Spagnoletti, Ltd. Switches, bells, &c., British Insulated & Helsby Cables, Ltd.; Edison & Swan Electric Light Co.; Electric & Ordnance Accessories Co., Ltd.; Evered & Co., Ltd.; Hawkers, Ltd. India-rubber, gutta-percha, &c., Co.; International Electric Co.; Johnson & Phillips, Ltd.; Kelvin & James White, Ltd.; McGeoch & Co., Ltd.; Player & Mitchell; Reid Bros.; Spagnoletti, Ltd.; Sterling Telephone & Electric Co., Ltd.; Walters' Electrical Manufacturing Co., Ltd.; A. Watson & Co. War Office : Electric light fittings, Credenda Conduits Co.; Edison & Swan United Electric Light Co., Ltd.; General Electric Co., Ltd.; S. Heath & Sons, Ltd.; Kensington Stamping Co., Ltd.; Veritys, Ltd. Electric cranes, C. & A. Musker. General Post Office : Telegraphic apparatus, Gell Telegraphic Appliances Syndicate, Ltd. Magneto bells, British L. M. Ericsson Manufacturing Co., Ltd. Insulator spindles, Bullers, Ltd. Telephones, Western Electric Co., Ltd. Bronze wire, F. Smith & Co., &c., Ltd. Annealed copper wire, R. Johnson & Nephew, Ltd. Flameproof wire, London Electric Wire Co. & Smith's, Ltd. Electric lighting of Edinburgh head post office, J. Gray & Son. Ditto, of Western District post office, Wimpole Street, W., A. Maund. Telephone equipment private branch exchange lamp signalling system at Harrod's Stores, Brompton Dynamo Co., Ltd.; Bruce Peebles & Co.

The London and North-Western Railway have accepted the tender of Messrs. W. Geipel & Co., Vulcan Works, St. Thomas Street, London, S.E., for the supply of Henrion arc lamp carbons during the year ending June 30th, 1911, for the whole of the Company's requirements, the total annual consumption amounting to 1,373,000 carbons. This is a renewal of last year's contract.

APPOINTMENTS AND PERSONAL NOTES

Mr. E. W. Moss, who has been for four years assistant to Dr. Silvanus P. Thompson at the Finsbury Technical College, has joined the electrical department of Messrs. Boult, Wade & Tennant, patent agents. Mr. J. Mould has been appointed assistant to Dr. Silvanus P. Thompson in place of Mr. E. W. Moss.

Mr. H. Webber, Chief Assistant Electrical Engineer to the Sunderland Corporation, has been appointed Borough Electrical Engineer at Keighley, at a salary of £250 per annum. There were 123 applications for the post.

Mr. J. A. Robertson, Borough Electrical Engineer at Greenock, has been granted an increase of £50 in his salary. We believe that Mr. Robertson was a candidate for the position of Borough Electrical Engineer at Salford.

The Senior Charge Engineer of the Willesden undertaking having resigned on obtaining another appointment, Mr. J. C. Johnson has been appointed to fill the vacancy at a salary of 40s. per week. Mr. J. D. Ravenscroft is to take Mr. Johnson's place at 35s. per week, and a third man is to be appointed at a salary of 30s. per week, rising to 32s. 6d. at the end of six months.

Owing to Mr. C. W. Salt, Chief Assistant Electrical Engineer at Bradford, having been appointed Chief Electrical Engineer to the Torquay Electricity Undertaking, the Bradford City Council have made the following appointments: Mr. Harry S. Ellis, Assistant Electrical Engineer, has been appointed Deputy Electrical Engineer and Manager; Mr. J. H. Schnauber, Chief Draughtsman, has been appointed Assistant Electrical Engineer.

MISCELLANEOUS CITY NOTES

MORTGAGES AND CHARGES.—W. H. Allen, Son & Co., Ltd., £50,000 debentures, created June 15th, 1910. Property charged, freehold lands and premises at Bedford and leasehold property at Liverpool, Westminster, and the company's undertaking generally. Trustees: W. P. Norton, 57½ Old Broad Street, E.C.; G. H. Morse, Thorpe St. Andrew, Norfolk; and A. G. Scott, Westminster.

DIVIDENDS ANNOUNCED.—Eastern Telegraph Co., first quarterly dividend of 1¼ per cent. on ordinary stock, free of tax, for 1910. The Electric and Beneral Investment Co., 6 per cent. on the ordinary shares for the year to May 31st. National Electric Supply Co., interim dividend of 3s. per share.

Mexican Electric Light & Power Co., 1 per cent. on the ordinary shares for quarter to June 30th.

The South London Single-Phase Railway.—It is stated that the work of extending the single-phase railway of the London, Brighton and South Coast Railway Co. to the Crystal Palace has been commenced.

Birthday Honours.—Among the Birthday Honours, Sir Wm. Mather, chairman of Messrs. Mather & Platt, Ltd., has been made a Privy Councillor, and Dr. R. T. Glazebrook, F.R.S., has been made a C.B.

Revocation of Patents.—An interesting decision has just been given by the Comptroller-General of Patents in connection with an application under Section 27 of the Patents Act for the revocation of seven patents owned by the Mercédès Daimler Motor Co., Ltd., on the ground of inadequate manufacture in this country. The applicants admitted that, in addition to the manufacture by the patentees and their licensees, there was an extensive manufacture by infringers in the United Kingdom, but they contended that this manufacture by infringers should not be taken into consideration, and could not be relied upon by the patentees in defence. The Comptroller, however, has decided that "the term 'patented article' in Section 27 means an article which is the subject of a British patent and is manufactured in accordance with the specification, or by means of the process therein described, by whomsoever manufactured, and that consequently manufacture by infringers in this country must be taken into account in favour of the patentee." The application for revocation was dismissed, but an appeal has been lodged by the applicants against this decision.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £57 5s. to £57 15s. per ton (last week, £57 10s. to £58).

OSRAM LAMPS FOR TRAIN LIGHTING.—We have received from the General Electric Co. some particulars of the experimental use of Osram lamps for train lighting on the Waterloo & City Railway. The lights are placed in the centre of the roof, 26 fittings being utilised for each four-car train, each of the larger cars taking seven 55-watt Osram lamps, and the smaller cars six 55-watt Osrams, each independently arranged in an opalite globe. The lamps are burned four in series, and were installed in June, 1909. Many of the original lamps are still in use.

AGENCY.—Mr. S. Heilpern (82 Hamilton Road, Longsight, Manchester) informs us that he is now acting as agent for measuring instruments of switchboard and other patterns, made by Rubert Abrahamsohn, of Charlottenburg.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—A meeting of Mackey's Electric Lamp Co., Ltd., will be held on August 3rd, at 12 noon, at 174 and 175 Aldersgate Street, London, to hear the liquidator's account of the winding-up.

A meeting of the Electric Sterilizing, Carbonizing & Stripping Co., Ltd., will be held at Prudential Buildings, Market Place, Dewsbury, on July 27th, at 4 p.m., to receive the liquidator's account of the winding-up.

The trustee in the bankruptcy of Herbert Shuttleworth, electrical engineer, Cross Court, Briggate, Leeds, has been released.

The adjudication of bankruptcy against George Huntingdon, electrician, 83 Battersea Rise, and Dering Street, Bond Street, London, has been annulled, all the debts having been paid in full.

The trustee in the bankruptcy of Arnold Roberts, electrical engineer, 21 North Parade, Bradford, has been released.

In the London Bankruptcy Court on Tuesday the public examination of Mr. W. H. Trentham, Consulting Electrical Engineer, 39 Victoria Street, London, S.W., took place. It was stated that the debtor started business as a consulting engineer in 1892 with about £50. The business was very successful down to about 1904, when he began speculating upon the Stock Exchange in copper and other shares. A firm of stockbrokers were now creditors for £7,718. In 1907 he took in partnership a Mr. Hemming, who paid a premium of £500, and agreed to bring in £500 capital. Of the latter sum, only £75 was provided, but there was a dispute with regard to a payment of £250 from the Mile End Board of Guardians, which Mr. Trentham claimed as his own property, and paid into his private banking account, instead of into the partnership banking account. Under the partnership agreement an arbitration took place, but it was held that £186 of the amount in question belonged to the partnership, and that Mr. Trentham's action in this matter constituted a breach of the partnership agreement, which was accordingly dissolved. The examination was closed.

MESSRS. SIEMENS BROS. LAMP WORKS OUTING.—On Saturday the employees of Messrs. Siemens Bros. Lamp Works had their second annual outing to Brighton. Over 500 made the journey, Brighton being reached at 8.30 a.m. Luncheon was served in the Aquarium, and the outing was thoroughly successful.

POOLEY & AUSTIN.—We are informed that Messrs. Pooley & Austin have, owing to greatly increased business, removed to larger offices at 25 Victoria Street, London, S.W., where they propose carrying a stock of cable, control gear, and other apparatus for which they hold sole agencies in the southern district.

Telewriter Exchange.—The first exchange to be put into operation by the Telewriter Syndicate will be opened to-morrow (Friday) by the Rt. Hon. the Lord Mayor of London. The Exchange is situated at 20 Bucklesbury, and at present there are 40 subscribers, mostly large City firms.

L.C.C. Engineering School, Poplar.—The Electrical Engineering Students' Association held a debate on "Gas v. Electricity," last Wednesday, in which a large number of students and members of the staff took part. On taking a vote electricity had a triumphant victory.

The Institution of Mining Electrical Engineers.—Owing to the similarity between the title under which this body was orignially founded to an existing institution, the Council have decided that the title be altered to the Association of Mining Electrical Engineers.

The Proposed Crystal Palace Tube Railway.—The scheme for the construction of a tube railway from Victoria to the Crystal Palace has undergone some slight modification. The terminus of the railway will now be at the Penge entrance to the Palace, instead of at Upper Norwood, as originally proposed. The total length of the line will now be at 6¼ miles, with a branch line of 1½ miles long, running from the Elephant and Castle to a point near the Walworth Road. The estimated cost of the new line is £340,800 per mile.

COMPANIES' MEETINGS AND REPORTS

UNITED ELECTRIC TRAMWAYS OF MONTE VIDEO.—At the ordinary general meeting last week, Mr. G. A. Touche said that the year under review was the first complete year of working under electric traction. Eighty-two miles of track were now in use. The net receipts, £105,472, showed an increase of 26 per cent. The net profit for the year, after meeting debenture interest, &c., was £63,863, of which £2,000 had been set aside for debenture redemption, and £15,000 placed to renewals and contingency account. A final dividend on the preference shares, making 6 per cent. for the year, was recommended, and a dividend at the rate of 3 per cent. for the half year on the ordinary shares, making 6 per cent. for the year. £11,847 has been carried forward.

R. WAYGOOD & CO.—At the ordinary meeting last week the report and accounts given in our last issue were adopted. The chairman complained that in spite of the fact that they had done more work, profits had been reduced owing to the exceptionally low prices obtained. He referred to several large contracts for lifts which had been carried out.

ANGLO-PORTUGUESE TELEPHONE.—At the annual meeting on Thursday last, the Chairman, Mr. H. Allen, stated that in five years the income had increased from £25,962 to £49,489, and the net profit from £8,360 to £16,571. The dividend was 8 per cent., including the final dividend of 5 per cent., now to be paid, and a sum equal to a further 7½ per cent. was being placed to reserve. After setting aside a substantial sum for redemption of debentures, an amount equal to another 5 per cent. was being carried forward. The systems at Lisbon and Oporto have been inspected by Mr. F. Gill (Chief Engineer to the National Telephone Co.) during the year.

NATIONAL ELECTRIC CONSTRUCTION.—Mr. L. B. Schlesinger presided at the annual meeting last Friday, and spoke hopefully of the progress of undertakings in which the company was substantially interested. The profit on contracts completed had declined from £24,016 to £6,957, as there has been practically no tramway construction during the year in this country. The net profit for the year was £1,868, which, with the amount brought forward, made a total of £11,530, of which £5,208 was transferred to reserve and depreciation accounts, and £6,321 carried forward. As there was no work of importance to be obtained in England, the directors were devoting their energies to securing contracts abroad.

COMPANIES STRUCK OFF REGISTER.—The names of the following companies will be struck off the register within three months, unless cause is shown to the contrary:—Electric Vehicles Development Co.; Macclesfield Tramway Syndicate; Newark Electric Supply Co.; Ystradgynlais Electric Lighting Co.

INDIA RUBBER, GUTTA PERCHA & TELEGRAPH WORKS CO.—At the annual meeting last week, the instability of the markets for raw material was referred to. Major L. Darwin, who presided, said that rubber stood at a high price, gutta percha was expensive, cotton had been uncertain, and copper gradually dwindling in price. At present they were fairly well occupied in the submarine and electrical departments.

MARCONI INTERNATIONAL MARINE COMMUNICATION CO.—After providing for debenture interest, the accounts for 1909 show a net profit of £1,466.

MARCONI WIRELESS TELEGRAPH CO.—Mr. G. Marconi presided at the annual meeting on Tuesday, and referred to important negotiations which are taking place with foreign Governments for the development of wireless communication abroad. In this matter they had the hearty support of the Foreign Office. Further, they had submitted a scheme to the British Government for a further extension of long-distance communication, and hoped that at a not distant date they would obtain the necessary licenses. In this connection the fire which destroyed their Glacé Bay station, although a great misfortune, was not entirely an unmixed blessing. The improvements which had been introduced in the reconstruction would, they were confident, compensate them in the future for the time lost, and would serve the company in good stead in other directions, for it would not be news to most of the shareholders that it was not by any means their intention to be satisfied with the Transatlantic service. The future policy of the company was to open a large number of telegraph services throughout the world.

PERTH ELECTRIC TRAMWAYS.—The net profit for 1909 was £12,456, to which has to be added £1,100 brought forward. A dividend of 2½ per cent. is recommended on the ordinary shares, and after placing £4,000 to reserve in respect of additional rolling stock and the North Perth extension, a sum of £1,056 is carried forward. In connection with negotiations for certain extensions, it was found that general feeling in Perth was that the tramways should be acquired, either by the municipality or the State. The directors have put forward certain suggestions which the various authorities are considering, and have intimated their willingness to listen to any reasonable proposals from the City Council or the Government.

Digitized by Google

ARON ELECTRICITY METER.—The accounts for 1909, after providing for general charges and depreciation, show a net profit of £21,118, making, with the balance of £6,549 carried forward from last year, a total available profit of £27,667. Out of this amount the directors distributed in December last a dividend of 3 per cent. on the preference shares, absorbing £3,747, and leaving to be disposed of the sum of £23,920. The directors' recommend payment of a further 9 per cent. on the preference shares, thus wiping off the arrears due to the preference shareholders. The Board hope that the ordinary shareholders may in the near future participate in the distribution of dividends. The past year's trading has been, in the opinion of the directors, most satisfactory, the sales having exceeded those of any previous year. The increased demand for the company's products has employed the factories to the full.

Mr. H. Hirst, Chairman of the company, presided at the annual meeting on Friday, and remarked that the similarity of the figures in the balance-sheets of 1909 and 1910 showed that the business had attained a pleasant stability. The profits had risen in this year's accounts to the satisfactory total of £35,630, £1,330 more than last year, which was, up to that time, the record year. The other items on the profit and loss account were within a per cent. or two the same as last year. They had written off £400 more for depreciation, not because the plant was in any worse condition, but in an industrial business which is constantly in process of evolution, it was a good policy to use some of the profit of good years for writing down certain capital items. Maintenance of patents was a few hundred pounds less, and so, naturally, was debenture interest, for their debt decreased every year by the repayment of about £5,000. As regards the balance-sheet, only two figures called for comment compared with previous years. They had added to their leasehold land, buildings, machinery, and tools the sum of £9,279; this figure was largely composed of additional land and buildings rendered necessary by the increase of their business. They had less cash to the extent of £15,000 if loans at short notice were included. This was accounted for by the greater trading outstandings, which were £58,000 this year as against £40,000 last year, and also to some extent by the extensions of the taximeter business. The taximeter business particularly was at present absorbing money; these instruments were not sold outright, but hired out, mostly for periods of five years. They had received very satisfactory contracts in London, Brussels, and Vienna for hiring out taximeters, and while they had to manufacture and instal every instrument, the cost of both manufacture and installation had to be defrayed at present from their liquid assets; payment, however, was received only in monthly or quarterly instalments, and it followed that the outgoings so far as capital expenditure was concerned were still greater than the incomings, and this state of affairs was likely to continue for some time if they were successful in obtaining new contracts. The profits shown in this year's accounts had been made entirely by their old established meter and clock business. For the safety of the company the directors had so far used all the income received from taximeters against manufacturing and installation expenses.

It was a matter of great satisfaction to the Board, particularly to Prof. Aron as Managing Director, and to himself as Chairman, that they were able this year to recommend the distribution of a dividend which would clear off the last of the arrears due to Preference Shareholders. The conservative policy which necessitated in years gone by the accumulation of these arrears had been vindicated, not only by their ability to pay them back now, but also by having established a business which showed a greater turnover than at any time during its existence. They were firmly planted in nearly every European country, and had found a particularly useful outlet for their manufactures in the constantly growing and prosperous Power Companies on the Continent. The average yield per meter was less than in former years, but they had made up for this by selling a very much larger number of meters, and by manufacturing more cheaply. He sincerely hoped, and there was great reason for that hope, that the ordinary shareholders would in the near future be rewarded for their great patience. Before putting the motion for the adoption of the Report and Accounts to the meeting, he expressed his pleasure that Prof. Aron was able to be present at this year's meeting, and he was anxious to take this opportunity of thanking him for the hard and great work which he had given unstintingly to the Company and which had been the mainspring of their success. He had been loyally backed up by their excellent staff whom he had placed in charge of the Company's various undertakings in the different countries, and their efficiency and loyal and strenuous work was greatly due to his master-mind, who was constantly controlling them. He had much pleasure in moving "that the report and accounts as presented to the shareholders be received and adopted."

No questions being asked, the report and accounts were unanimously adopted.

The Chairman next moved that a dividend of 9 per cent. be paid upon the preference shares as recommended in the Directors' report, and on this being put to the meeting it was carried unanimously.

The retiring directors, Mr. H. Hirst and Sir James Pender, Bart., were re-elected. In moving the resolution, Mr. Roger W. Wallace, K.C., referred to the great advantage of retaining Mr. Hirst's services as Chairman. Being prominently identified with the electrical industry, he was in the City all day, and his work for the Company was, therefore, practically continuous.

Messrs. Price, Waterhouse and Co., having been re-elected auditors for the coming year, a vote of thanks to the Chairman closed the proceedings.

NEW COMPANIES

STEPHEN COTTON & CO., Sydney Street, West Belfast. Capital, £20,000. Electrical engineers, machine makers, iron and brass founders, &c.

R.O.E. SYNDICATE, 20-21 Essex Street, London. Capital, £1,000. Manufacturers, miners, electrical and mechanical engineers, contractors, &c.

BRITISH ARC WELDING CO.—Suffolk House, Cannon Street, London. Capital, £15,000 in £10 shares. Electrical and mechanical engineers, &c.

ELECTRICAL TRUST.—9-10 Pancras Lane, London, E.C. 2,500 shares (10,000 founders' shares of 1d. each). Electrical telegraph, telephone, and mechanical engineers.

ALLEN, WEST & CO.—47 Victoria Street, London. Capital £20,000. Electrical and mechanical engineers.

GARRETT, HUNT & CO., 181 High Street, Lewisham, London. Capital, £2,000. Electrical engineers and contractors.

RAILOPHONES, 21 Woodend Road, Erdington, Warwick. Capital, £500. Telegraph and telephone makers, electricians, &c.

EXPRESS CABLE INVENTIONS, 29A Charing Cross Road, London. Capital, £50,000. To acquire from H. Knudsen certain patents for transmitting and receiving photographs and printed and typewritten messages by wireless telegraphy, and over cables and land lines.

HILL, HARDING & CO., Shandon Road, Clapham Park, London. Capital, £1,000 (1,000 deferred shares of 1s. each). Electrical and optical instrument manufacturers.

HILL & HARRINGTON, 41 Berners Street, London, W. Capital, £2,000. Electrical and mechanical engineers.

W. T. PEARE, 3 Catherine Street, Waterford. Capital, £10,000. Electrical engineers, &c.

HARPIN & CO., Bank Chambers, 47 Temple Row, Birmingham. Capital, £2,500 (1,500 6 per cent. cumulative preference shares). To take over the business of electric lighting and power engineers at present carried on at Birmingham and Dudley.

GRINDELL-MATTHEWS WIRELESS TELEPHONE SYNDICATE.—Registered by Ashurst, Morris, Crisp & Co., 17 Throgmorton Avenue, London, E.C. Capital, £20,000. Electrical and general engineers, and manufacturers of telephonic and telegraphic apparatus.

CRAMPTON & CO.—Registered by Waterlow & Sons, Ltd., London Wall, E.C. Capital, £2,500. Electrical engineers and contractors.

ELECTRO-CHLORINATION SYNDICATE.—Registered office, 39 Victoria Street, London. Capital, £50,000 in 48,000 preferred ordinary shares of £1 each, and 40,000 deferred ordinary shares of 1s. each. To acquire and lay down a working plant for the reduction of ores and the refinement of metals by new processes in chlorination and electrolysis, to carry on the business of miners, smelters, metal workers, &c., and to adopt an agreement with H. W. Couzens. Among the subscribers are A. E. Mavor, electrical engineer; H. W. Couzens, electrical engineer; C. Manuel, engineer; and G. W. Zeden, electrical engineer.

TELEGRAPH CONDENSER, LTD.—Capital of £5,000, to take over the business of the Telegraph Condenser Co., and to carry on the business of manufacturers of, and dealers in, electrical apparatus. Private company. First directors, J. A. L. Dearlove and S. G. Brown. Registered office: The Factory, Vauxhall Street, S.E.

ADAMS WATKIN & CO.—Capital £11,000, in £1 shares. Business: Bankers, financiers, &c. Private company. Office: 36 Victoria Street, Westminster.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 23rd, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

12,808/09. **Station and Street Lanterns.** H. WARDLE. Lanterns for metal filament lamps, and suitable for station, shop, or street lighting, have the upper hood or casing perforated by the characters of a name or advertisement, so that the light is reflected through. An extra lamp may be placed in the hood to illuminate the characters. Five claims, three figures.

12,937/09. **Third-rail Construction.** R. J. HOUGHTON, P. ALLMAN, and W. T. GRAY. Positive and negative conductor rails electrically independent of the track are supported one on each side of a central continuous girder by means of divided insulators put together by bolts passing through the supporting girder. Four claims, twelve figures.

13,220/09. **Metal Sheathed Wiring Cable.** SIEMENS BROS. & Co., H. W. HANDCOCK, A. H. DYKES, and J. J. RAWLINGS. Cables of small diameter for house wiring, &c., have a covering of lead strengthened with metal strip or spirally-wound wires to prevent kinking at bends. The wire or strip is made integral with the lead covering by braiding it on the lead through a hot die, or by some similar process. Five claims, five figures.

15,282/09. **Petrol-electric Mechanism.** FELTEN & GUILLEAUME-LAHMEYER-WERKE A.-G. A purely electrical or a purely mechanical differential drive is obtained by a combination consisting of a dynamo coupled by a differential gear both to the petrol engine and to one of the two driving wheels. An electric motor supplied from the dynamo is coupled to the other driving wheel. For purely mechanical drive the dynamo and motor armatures are coupled together by means of a clutch. Two claims, one figure.

20,105/09. **Filling Joint Boxes.** C. J. BEAVER and E. A. CLAREMONT. To minimise the difficulties due to the rapid cooling of and solidifying of the compound when poured into the box, a special form of funnel, making a tight fit with the box inlet and provided with an outside jacket, is employed. The compound is poured into the funnel and into the annular space until it overflows through the vent-holes. These latter are then closed, and a head of hot compound is maintained in the funnel until all the gas and air in the box has bubbled through. Three claims, one figure.

25,156/09. **Switch with Locking Device.** S. EVERED and EVERED & Co., LTD. In a quick make and break knife switch, the blade is locked in its "off" and "on" positions by a simple spring device for preventing the accidental contact of the blade with the switch contacts. Two claims, four figures.

3,247/10. **Ignition Apparatus.** B. BROOKS and F. H. ALSTON. Ball or roller-bearing collectors are employed in place of rubbing contacts where electrical connection is to be made between fixed and moving parts. The ring of balls runs upon a fixed race in an open cup, and is engaged by a spring plunger on the rotating part. Two claims, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Names in italics indicate communicators of inventions from abroad.

Arc Lamps: FRANCIS [Stage lamp] 13,265/09; TUBBS [Magazine lamps] 13,834/09; HEIMANN and SCHÄFFER [Running arc lamps in series with incandescent lamps] 22,302/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: HARVEY and BASS [Cable armouring] 13,576/09; SIEMENS BROS. & Co. and DIESELHORST [Manufacture of cables] 1,301/10.

Dynamos, Motors, and Transformers: SIEMENS BROS. DYNAMO WORKS and KIEFFER [A.-C. induction motors] 16,811/09; MIDGLEY and VANDERVELL [Generators] 17,189/09; BRITISH THOMSON-HOUSTON Co. (*Noegerath*) [Machines] 20,584/09; SIEMENS BROS. DYNAMO WORKS (*Siemens Schuckertwerke-Ges.*) [Brush rocker] 3,914/10.

Electric Ignition: MARKS (*Milton*) [Interrupters] 13,573/09; LODGE [Sparking plugs] 15,251/09; BRÜCKERT [Magnetos] 20,013/09; LEWIS [Ignition of miners' lamps] 25,144/09; MILTON [Magnetos] 24,838/09.

Electrometallurgy and Electrochemistry: NIBLETT [Bleaching compound] 8,270/09; THUM [Electrolytic apparatus] 14,660/09; HÄRDÉN [Furnaces] 26,251/09; SOC. ELECTRO-METALLURGIQUE FRANÇAISE [Manufacture of nickel] 287/10; SOC. D'ELECTRO-CHIMIE and HULIN [Electrolytic production of alkaline metals] 6,065/10.

Heating and Cooking: BASTIAN, 13,827/09.

Incandescent Lamps: BASTIAN, 13,228/09; CLARKE [Nernst-type lamps] 13,591/09.

Instruments and Meters: EVERSHED & VIGNOLES, LTD. [Meters] 13,080/09; JOHNS and JOHNSON & PHILLIPS, LTD. [Signalling and indicating instruments of the resonance type] 13,237/09; WATKIN [Pyrometers] 7,813/10.

Switchgear, Fuses, and Fittings: MEHNE [Remote control gear] 14,052/09; ARCIONI [Excess-voltage protective devices] 14,965/09; HIRST and COATES [Lamp-holder insulating cover] 17,101/09; VAUGHAN [Table fittings] 23,071/09; BOULT (*Acme Automatic Street Indicating Co.*) [Switches] 23,719/09; DEUTSCHE GASGLÜHLICHT AKT.-GES. (*Auer-Ges.*) [Suspension of lamps in streets] 1,166/10.

Telephony and Telegraphy: ADAMS-RANDALL [Telephones] 13,771/09; SIEMENS & HALSKE A.-G. [Semi-automatic telephone exchanges] 6,875/10.

Traction: HADFIELD [Tramway points] 14,248/09; WALKER [Route indicators] 19,273/09; IRVING [Switch-points] 19,434/09; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Signalling] 21,101/09; LOWTHIAN [Electric fog signals] 26,687/09; BALACHOWSKY and CAIRE [Driving-axles of electric cars] 28,475/09; BROWN [Brake-blocks] 29,797/09; SAYERS and SALT [Electric staff signalling] 3,902/10; W. R. SYKES INTERLOCKING SIGNAL Co. [Signalling] 4,643/10; COTA [Air brakes] 10,776/10.

Miscellaneous: SUNDHEIMER [Burglar alarm] 13,956/09; LERTOURNÉ [Synchronising electrically driven machines] 15,981/09; NEWMAN [Burglar alarm] 23,506/09; SCHERL [Gyroscopic apparatus] 27,590/09; WILSON [Electric condensers] 9,832/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: JABURG, 13,305/10.

Electric Ignition: SOC. INDUSTRIELLE DE DELLE, 12,593/10.

Electrometallurgy, &c.: PETERSON [Charging resistance furnaces] 6,035/10; PRESSER [Manufacture of nitrogen oxides] 7,319/10.

Switchgear, &c.: DRUSEIDT [Switches] 9,399/10; SHEMWELL [Switch-throwing mechanism] 12,180/10.

Miscellaneous: SIEMUND [Electric welding] 12,724/10.

Opposition to Grant of Patents

8,146/09. **Metal Filaments.** R. HOPFELT. This patent has been granted in spite of opposition. It covers a process for removing hydrocarbons by sintering the filaments in an atmosphere of a halogen compound such as phosphorous tri-chloride.

19,847/08. **Phospham in Metal Filament Lamps.** GLÜHLAMPENWERKE ANKER-GES. The decision of the Comptroller to refuse this patent in consequence of the opposition of the "Z" Electric Lamp Manufacturing Co. has been appealed against. An abstract of the Comptroller's decision was given in ELECTRICAL ENGINEERING, June 16th, 1910, p. 390.

Application for Amendment

28,522/04. **Railway Signalling.** W. J. MACKENZIE. The Brown-Mackenzie Signal Co., Ltd., desire to amend this specification in order to limit the scope of the invention. The patent covers a system of electric signalling for railways, in which signalling apparatus on the locomotive is operated by means of contact rails laid along the track and controlled from the signal cabins.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

14,682 of July 2nd, 1896. **Stopping Trains.** A. SPENCER. Passengers are enabled to apply the brakes and attract the attention of the guard by pulling a chain. This opens the cocks of the Westinghouse or other pressure brake system, and also admits air to a whistle.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: H. C. LEVIS (*General Electric Co., U.S.A.*) [Magnetite lamp] 6,042/04.

Dynamos, &c.: H. CHITTY [Cooling of machines] 4,892/05.

Electric Ignition: E. EISEMAN [H.-T. ignition system] 6,000/02.

Electrometallurgy, &c.: B. J. ROUND [Electroplating] 4,865/99.

Instruments, &c.: E. WILSON [Electrometer] 5,582/04; H. OPPENHEIMER (*A.-G. Mix. & Genest*) [Meter counting trains] 6,001/04; H. H. LAKE (*N. Jacobsen*) [Testing buzzer for batteries] 4,780/05; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Prepayment meter] 4,783/05.

Switchgear, &c.: E. A. CARDAN [Resistance units] 5,169/03; J. M. BARR [Control of variable speed D.C. motors] 3,195/05; T. R. CHARLTON and G. H. TARVER [Control of electrically-driven pumps] 4,595/05.

Traction: F. SMITH [Trolley guard wires] 5,651/02.

Miscellaneous: A. REICHWALD (*F. Krupp, Essen*) [Sighting and firing of ordnance] 4,255/00 and 4,623/00; H. C. MICHELL [Mica insulation] 4,969-70/01; S. ROBERTS [Carbonising fibres] 4,595/05; W. H. SCOTT [Magnetic brakes for electric motors] 4,967/05.

SUMMARY

OUR Monthly Supplement on Electrical Engineering in Mines is included in this issue. It opens with an article on the International Mining Congress at Dusseldorf, where a number of Papers relating to electrical mining work were read. Reports are also given of two papers read last month at the meeting of the Mining Institute of Scotland at Dunfermline, one by Messrs. Crawford & Moores on gas-driven generating plant, and the other by Mr. F. Anslow on electric power in collieries. A description of an electrical winding plant in France is also given. Attention is drawn to a recent discussion upon inspection of mines in Parliament, and a report is given of the discussion on a Paper by Mr. W. Maurice on the battery plant at the Hucknall Collieries, and a short account of a discussion on earthing of colliery apparatus at a meeting of the Association of Mining Electrical Engineers. Some notes are also included on recent electrical mining patents.

THE Wimbledon & Sutton Electric Railway Bill has passed the House of Commons Committee stage, as also have the London Tube Railway Bills providing for the amalgamation of three lines. (Page 444.)

A DEPUTATION of members of Smoke Abatement Societies waited on the President of the Local Government Board last week, and urged still more activity in the prosecution of owners of smoky chimneys. Mr. Burns gave a sympathetic reply, but considered that as much of the nuisance was due to domestic as to factory chimneys. (Page 445.)

THE Chloride Electrical Storage Co. Ltd., write to us that they supplied the batteries for the telephones for the Antarctic Expedition. (Page 445.)

A SCHEME for the construction of a goods Clearing House for London was described at the London Chamber of Commerce last week. When received at the Clearing House, the goods would be handled by a series of electrically driven moving platforms, which would be so arranged as to avoid any hand-sorting. (Page 445.)

AMONG the specifications published by the Patent Office last Thursday was one by C. O. Bastian for a tubular incandescent lamp with a number of short filaments in series.—An improved form of resonance instrument in which the vibrating reed uncovers a figure on a scale, is protected by W. H. Johns and Johnson and Phillips. Other specifications include those of the Lodge double-pole sparking plug, an improved form of cable braiding by T. H. M. Harvey and S. W. Bass, and a method of casting the conductors of squirrel-cage rotors in place. A combined arc and resistance furnace is patented by J. Härden. (Page 446.)

THE "Telewriter" Exchange was opened by the Lord Mayor on Friday. There are at present about 50 subscribers, in each of whose offices is a telewriter, enabling them to transmit written messages and sketches to one another. There are three lines to the

Digitized by Google

Central Telegraph Office, and the Post Office has granted facilities to subscribers to send and receive telegrams on the instrument. A description of the apparatus and technical details with regard to the exchange equipment appear in an article on page 447.

AN induction motor with internal starting resistances, which are automatically switched out, is described on page 448.

THERE is a fine display of electrically-driven textile machinery at the Japan-British Exhibition. A few well-known electrical firms have stands in the Machinery Hall, but it cannot be said that British electrical engineering is well represented. (Page 449.)

UNDER Electrometallurgy is given an account of the Lindenberg Steelworks, Remshied-Hasten, which, with its important installation of Héroult furnaces, was visited by the members of the International Congress of Mining and Metallurgy at Düsseldorf. (Page 450.)

JUDGMENT has been given in the Canterbury County Court against the National Electric Construction Co., in which it is laid down that the Canterbury Corporation, having no powers to wire premises and supply fittings, equally has no powers to pay a contractor for doing such work on its behalf. They were, therefore, not liable to pay the company 1d. per unit for the hire of the wiring, which the consumer had refused to pay. (Page 450.)

THE Acton Council have decided to terminate their agreement with the Metropolitan Electric Supply Co. —Leicester Corporation have decided to separate the management of the electricity undertaking from that of the gas undertaking.—After lengthy tests, the Llandudno Corporation have decided not to substitute gas for electricity on the promenade.—Marylebone Council are recommended to abolish the standing annual charge in respect of cooking and heating apparatus.—Manchester tramway accounts for last year show a profit of £149,068. Oldham electricity accounts show a net profit of £2,203, the Luton accounts £3,066, Newport (Mon.) accounts £376, and Hammersmith £3,483. (Page 450.)

EXTENSIONS amounting to £19,872 are recommended at Islington. A turbo-alternator is required at Warrington; mains at Wednesbury; tramcar meters at Cardiff; metal filament lamps at Grimsby, and trolley wire at Manchester. Extensions are contemplated as follows:—Carlisle (£19,600); Bridlington (£2,675); Hammersmith (£15,000); Wednesbury (£327). (Page 451.)

THE whole of the shares provided for under the rearrangement of the British Aluminium Co. have been subscribed for.—The report of the Victoria Falls and Transvaal Power Co. for 1909 mentions a surplus of £50,534, and that the estimates of cost of generation have been fully justified. (Page 452.)

Wireless Telegraph Notes.—The United States Senate have passed a Bill rendering it necessary for all wireless telegraph installations in the United States to be licensed.

The delay in the arrival at Bombay of the steamer *Trieste* has given rise to complaints that more serious attention is not given to wireless telegraph installations by the shipping companies and the Government. Although the *Trieste* was on the steamer route all the time the boat absolutely disappeared from June 14th to July 1st. It is pointed out by the *Times* Bombay correspondent that public wireless stations are necessary at Aden, Karachi, and Ceylon, and that if the steamer had also been fitted it could have been in communication throughout her voyage.

It is stated that the Australian Commonwealth Government have decided to link up Australia, New Zealand, and Fiji by wireless telegraphy. The scheme provides for the establishment of high-power stations at Sydney, Doubtless Bay (New Zealand), Suva, and Ocean Island, and medium-power stations in the New Hebrides and Solomon Islands. The whole of the scheme will be under Government control.

The Bill requiring all vessels sailing from American ports with 50 or more passengers to be equipped with wireless telegraph apparatus by July 1st of next year, has been passed by the House of Representatives. The Bill has already passed the Senate.

PARLIAMENTARY INTELLIGENCE

PROGRESS OF ELECTRICAL BILLS.—The Belfast Corporation Bill and the Wemyss Tramways (Extensions) Order Confirmation Bill were read a third time and passed in the House of Commons on Wednesday.

The Dunfermline and District Tramways (Extensions) Order Confirmation Bill was read a third time and passed in the House of Commons on Tuesday last week.

The Yorkshire Electric Power Bill was read a third time and passed in the House of Commons on Monday last week, and the Leeds Corporation Bill a first time.

In the House of Lords on Wednesday, the Rhondda Tramways, Bradford Corporation, and Middlesbrough Corporation Bills were read a second time, and the Dunfermline Tramways Bill the first time.

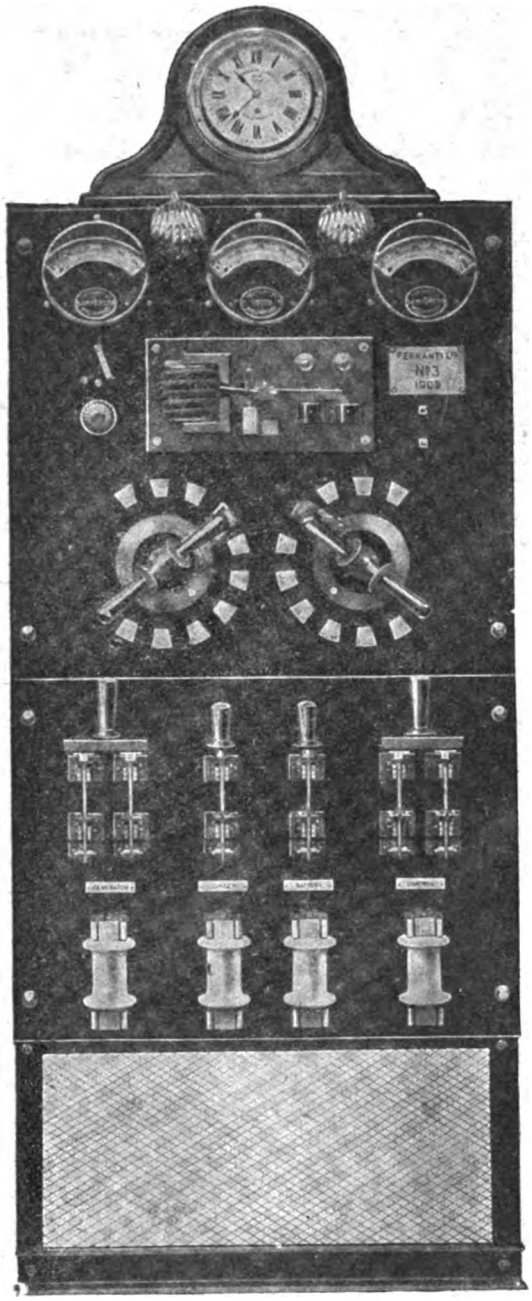
The London County Council (Tramways and Improvements) Bill was read a third time in the House of Commons on Monday, and a first time in the House of Lords.

Electric Lighting Provisional Order Confirmation Bills Nos. 1 and 2 were read a third time and passed in the House of Commons on Monday.

In the House of Lords on Monday, the London United Tramways Bill was read a third time.

WIMBLEDON & SUTTON ELECTRIC RAILWAY.—This Bill, which has already passed the House of Lords, was considered last week by a Select Committee of the House of Commons, and finally ordered to be reported for third reading. The line will form a continuation of the existing electric railway of the District Railway Co. at Wimbleodn, and the only opposition before the House of Commons Committee was from the London, Brighton and South Coast Railway, on the question of competition. The capital powers taken in the Bill are £350,000, and the estimated cost of construction is £311,000. The estimates have been approved by Sir John Wolfe Barry. The London, Brighton and South Coast Railway Co. claimed that they had spent large sums of money in catering for the Sutton traffic, and should be left alone—the desire for the new line emanated from a few landowners. The Committee, however, passed the preamble of the Bill.

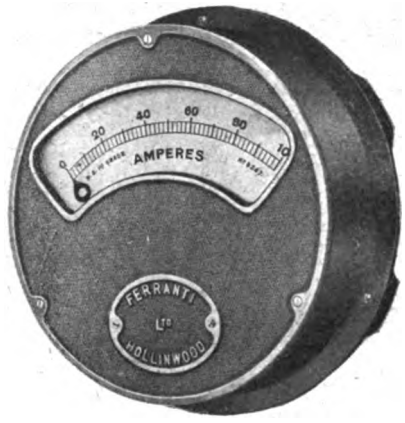
SOUTHAMPTON CORPORATION BILL.—This Bill, which provides for some tramway extensions and road widenings in connection therewith, was passed by the Local Legislation Committee of the House of Commons last week. The Corporation may borrow £10,440, repayable in 30 years, for construction, and £1,540, repayable in 20 years, for electrical equipment.



LONDON UNDERGROUND RAILWAY BILLS.—A number of Bills relating to the underground electric railway system of London were passed by the Unopposed Committee of the House of Commons on Friday. These Bills, of which we gave full particulars in our issue for April 14th, p. 252, include the amalgamation of the Great Northern, Piccadilly & Brompton, the Charing Cross, Euston & Hampstead, and the Baker Street & Waterloo Railways. A separate Bill in the name of the latter provides for some alterations to the Oxford Circus Station, including the installation of a moving stairway to carry passengers from the platform to the street level. The Bills have already passed the House of Lords.

METROPOLITAN RAILWAY BILL.—This Bill passed the Unopposed Committee of the House of Commons on Friday. The main proposals are the construction of subways at Moorgate Street, jointly with the City & South London Co. and the Great Northern & City Co.

Physical Society.—Among the Papers down for reading at to-morrow's meeting are "A Thermo-Electric Balance for the Absolute Measurement of Radiation," by Prof. H. L. Callendar, F.R.S.; "On Hysteresis Loops and Lissajous' Figures, and on the Energy wasted in a Hysteresis Loop," by Prof. S. P. Thompson, F.R.S.; and "The Energy Relations of Certain Detectors Used in Wireless Telegraphy," by Dr. W. H. Eccles.



Laboratory Equipment.—A Paper by W. P. Steinthal, accepted for publication in the *Journal* of the Institution of Electrical Engineers, considers the arrangement of experimental electrical circuits for laboratories. The author points out that a battery of accumulators is essential, as it is the only means of providing a steady pressure and also a number of different pressures. The battery may consist of from 30 to 55 cells, and, as the cells will be unevenly discharged, the author recommends the use of two small charging dynamos for half the total pressure each, both coupled to the same motor. For supplying alternating current, a motor generator with a single-phase armature, divided into four sections, capable of being connected in series or parallel, is recommended. For distribution, bar conductors are advocated as being cheapest and most easily adapted to new arrangements. Various ways of arranging the circuits are described, and plug boards for supplying any circuit at any required pressure A.-C. or D.-C., are illustrated. Finally, some recent laboratory equipments carried out on these principles are described with diagrams of connections.

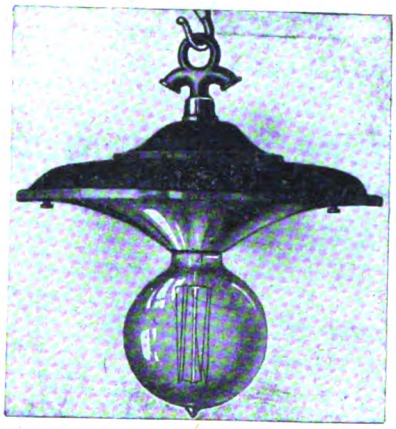
Saves 25 per cent. of the wear.—25 per cent. of the wear of valuable machinery can be saved by using the right starter.

The Adams 'IGRANIC'

AUTOMATIC STARTER

will appeal to Station Engineers for the reason that it takes just the exact amount of current necessary, under all conditions, and avoids current rushes.

It shoulders the operator's responsibility, and automatically performs the work of correctly starting up valuable machinery to better advantage than the individual himself. You simply press the button and the controller does the rest. The operator's responsibility ceases there and then, for the controller takes the starting in hand and the motor is accelerated gently and with intelligence all but human.



It is particularly useful in starting pumps, air compressors, lifts and haulage gear.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

THE INTERNATIONAL MINING CONGRESS AT DUSSELDORF

THE progress of electricity as a valuable adjunct to Colliery and Iron and Steel Works equipment was emphasised at Dusseldorf from June 18th to the 23rd, when the fifth International Congress of Mining, Metallurgy, Applied Mechanics and Practical Geology was held. It included amongst its 1,400 members from all parts of the world many prominent owners of collieries and works in this country, also engineers connected with such allied industries, whose interest in the transactions will tend towards the improvement of methods of mining and the application of power thereto, besides the fostering of good fellowship between ourselves and the foreigner with similar scientific and commercial interests.

There were 104 Papers read and discussed before the four sections into which the Convention was divided, and over thirty of these contained references to the uses and applications of electricity in the several industries. At one time it was regarded that to light the workings, and drive the small machinery employed below and above ground was the special and only functions of electricity. Since then electric drills, coal cutters, pumps, and haulage gears have become too familiar to need forcing on the colliery owner, but the data and particulars of working these contained in the Papers are most valuable as being reliable information given by the users themselves. The winding engine problem is now deserving particular attention, although most sceptical ideas are still entertained in some quarters in this country regarding the design of electric winding engines and their attendant initial cost and maintenance charges. The installation of these is, however, universal in Germany in the equipment of the more recent and up-to-date collieries.

During the Convention at Dusseldorf special interest was attached to the proceedings, as practical applications of the methods referred to in the contributions could be observed during the visits to the several collieries and works in the district, which were heartily appreciated by the large attendance of members present.

A typical colliery visited was the Rhein Elbe Colliery, Gelsenkirchen. These three pits have a maximum depth of 930 yards, and employ on an average 4,123 men to handle the daily output of 3,059 tons obtained during last year. The output of bye products for 1909 was as follows: 205,234 tons of coke, 3,705 tons of sulphate of ammonia, 10,456 tons of tar, 476 tons of benzol (including tolual and solvent naptha), and 184,770,000 cubic feet of gas. As indicating the extent of the equipment at such a colliery, we give hereunder a summary of the plant installed.

The electrical power plant consists of 3,480-kw. generators with vertical steam engines, and one 3,600-kw. generators with A.E.G. steam turbo-generator. In the main ventilating plant are included two Capell fans and one Rateau fan, with capacities, respectively, of 529,700, 211,900, and 282,500 cubic feet per minute. There are also four reserve fans similar to the last mentioned.

There are two air compressors with a capacity of 317,850 cubic feet per hour each, and one Meyer compressor with a capacity of 176,500 cubic feet per hour, measured at an intake-delivery pressure of six atmospheres. The pumping plant consists of one hydraulic pumping engine with two sets of pumps, raising 660 galls. 1,510 ft. and 2,330 ft., and two electric high-pressure centrifugal pumps, raising 660 galls. 1,610 ft. and 2,330 ft.

The following winding plants are in use: One horizontal double-cylinder winding engine, raising 8 tubs (4·4 tons) 678 yards; one horizontal double-cylinder winding engine, raising 4 tubs (2·2 tons) 754 yards; one electric Ilgner A.E.G. winding engine with 2,750-h.p. motors, raising 8 tubs (5 tons) 1,095 yards; and one electric Ilgner A.E.G. winding engine with 2,840-h.p. motors, raising 8 tubs (5 tons) 875 yards.

Among auxiliary plant may be mentioned one rope-way conveyor for coking coal (875 yards long), and in the stock yard, which is capable of storing 20,000 tons of coal, a crane bridge and ropeway for loading and discharging. The central condensing plant is capable of dealing with 50 tons of steam per hour. There is also a central superheater for utilising waste steam from coke ovens, and a gas works producing 2,119,000 cubic feet of coal gas per day with a gas-holder 7,000,000 cubic feet in capacity.

The boiler plant consists of five coal-fired Lancashire boilers (each 1,076 sq. ft. heating surface), 16 eccentric gas-fired corrugated flue boilers, each of 1,076 sq. ft. heating surface; four gas-fired Lancashire boilers, each of 1,076 sq. ft. heating surface; six coal-fired Machicol boilers, each of 3,230 sq. ft. heating surface; two coal-fired Lancashire boilers, each of 1,076 sq. ft. heating surface; and one coal-fired Cornish boiler of 1,076 sq. ft. heating surface.

The bye-product plant comprises 80 bottom-fired ovens, with recovery plant for ammonia, tar, and benzol, and 80 Otto regenerating ovens, with recovery plant for coal gas, tar, and ammonia. Underground haulage is performed by horses, also by benzol and compressed air locomotives. A fully equipped rescue corps of 57 men are employed for rescue, fire extinction, sanitation, and watchmen's duties, whilst there are 39 volunteer reserve men for similar work.

Some notes on the Lindenberg Steelworks, Remscheid Hasten, with its important electric furnace equipment, which was also visited by members of the Congress, will be found in another part of this issue.

At the concluding meeting of the Congress, held at Essen, it was unanimously decided to accept the invitation to hold the next Congress in London, which will take place there in 1915, and it behoves us to make great progress during the intervening period if we are to be in a position to equal the enterprise and hospitality of our friends in Germany.

A number of the papers read referred to electrical working in mines. In the course of a paper read in Section I. by Dr. W. Kohlmann (Diedenhofen) on **The Development of the Mining Industry in the Minette District**, it was mentioned that the necessity of providing compressed air for drills was inconvenient, as it was only used for this purpose. The Siemens & Halske rotary drill had been used to some extent, but in the author's opinion the drill of the future was the electrically operated percussion drill, the majority of the Minette mines having at their disposal a cheap supply of electrical power from the adjacent smelting works, and there being no difficulty in the way of laying electric cables in the mines. However, up to the present the available forms of electric percussion drills did not fulfil the requirements of the work. In the underground haulage, which presented no difficulty, the haulage roads being wide and usually straight, electric locomotives and endless ropeways had largely replaced horse traction during the past few years. In another Paper, by Paul Nicou (Nancy), on **The Present Situation of the Mining Industry in French Lorraine**, recorded the increasing use of electric power. Most of the new winding plants in the Briey mines are electric, and electric power, derived usually from turbine driven stations, is employed on a large scale for underground pumping, haulage, and drilling. Power drills were extensively used in the new mines at Briey, and enabled the winning of the ore to be carried on at a much quicker rate than was possible with hand drilling. Up to the present, electric drills were mainly used, though pneumatic percussion drills were employed in some cases.

Electrical pumping was dealt with in a paper by Herr

Digitized by Google

Schultze (Essen). He described a particularly compact electrically operated plunger pump of Haniel & Lueg, Düsseldorf, at work in a shaft of the Zollverein colliery. The machine, which is able to raise 138 gallons of water per minute against a total head of 1443 ft., consists of three single-action plunger pumps. The whole set is so compact, though accessible in every part, that the foundation occupies a space of only 6 ft. 6 in. by 10 ft. 6 in.

A Paper by F. Schember (Vienna) reviewed **The development of machine coal cutting.** The first coal cutting machines consisted of picks driven into the coal by means of mechanical gearing: hence their name, "hewing machines." These machines were used in England, America, and Germany. Subsequently the rotary and chain types of machines were introduced. The author classified the various machines in use in different countries, and pronounced the opinion that where longwall working is practised the "Pick Quick" bar machine of Mavor & Coulson, Glasgow, is the machine of the future, and for all other purposes where undercutting is at all possible, the Eisenbeis Universal undercutting and nicking machine of the Duisburger Maschinenbau-A. G., formerly Bechem & Keetman, Duisburg. Another Paper in the same section, by G. von Hanffstengel (Leipsic), urged the more extended use of electrically driven wire ropeways, and mentioned cases where considerable economy had been obtained by their use.

In Section III. one of the papers of interest to electrical engineers was that by F. Heym (Welter, Ruhr) on **The influence of electricity on the development and efficiency of lifting appliances in mining and steel works.** The introduction of electricity as motive power enabled the working speeds of cranes, &c., to be increased considerably and to extend the applicability of hoisting machines, owing to the convenient transmission of power and supply of the current. The result was an increase of the production and increased demands of the efficiency of the transporting appliances. By electrical driving it was possible to operate the different motions with precision and rapidity from any desired point. On account of the centralisation of the generating plant thus made possible, the working expenses were reduced, and it was feasible to adopt mechanically driven lifting appliances for dealing with work, where their application previously was not economical. Electric winders, circular waggon tips, waggon tipping devices, and loading bridges effect the transport of the material raised from the mines, almost dispensing with the attendance of workmen. Where it would not pay—owing to the small amount of work to be coped with—to adopt large loading bridges for the transport of bulk goods, telpher lines, &c., with single travelling trolleys are provided in their place. In blast furnaces the transport of the materials to the mouth of the furnace is almost exclusively carried out by means of inclined electrically driven hoists, which render no workmen necessary on the charging platform. The capacity of these hoists has already attained some 2,200 tons of coke and ore in a shift of eighteen hours. In steel works and rolling mills special types of cranes have been adopted for each sort of work. Special cranes serve for filling and transporting the boxes in openhearth plants and for charging same into the furnace. The casting cars travelling on the floor are now almost entirely displaced by overhead casting cranes running at high speeds. For stripping the ingots from the moulds and transporting same to the soaking pits and reheating furnaces, as well as for loading the half-finished and finished products, special cranes with tongs, lifting magnets, rotary and tilting grippers are now constructed. The use of lifting magnets, which obviate the necessity of sling chains or tongs, has been especially developed. By employing a lifting magnet in handling scrap and similar materials, the manual labour is almost dispensed with and consequently large savings are effected.

Papers read in the same section by Dr. Hoffmann (Bochum) and Prof. Langer (Aix-la-Chapelle) dealt respectively with the control and governing of steam engines and experience with large gas engines. K. Maleyka also read a paper in this section on electricity in metallurgical work, which was confined to the giving of a review of the forms in which electric energy finds application in metallurgy, and to the pointing out of the peculiarities of the most important branches of work without going into details.

The following is an abstract of a paper read by W. Philippi (Berlin) on **Electricity in mining**:—After a short introduction regarding the extension of the application of electrical machinery in mines in Germany, attention is first paid to the question of the most economical generation of electric energy, and the ways of reducing the generating costs in mines are mentioned. In connection with the details of electric mining machinery, the small underground installations, such as for lighting, boring, coal cutting, and, further, for small hoists, are first treated. The advantages of the electrically driven boring machines as compared with those using compressed air as motive power, are gone into to some extent. The chief part of the paper deals with pumping plants, ventilators, and large winding-engines. Under the first mentioned subject special attention is given to the sinking pumps, on account of the particular advantages which electricity possesses as motive force for these. The stationary pumps are divided into electrically driven plunger pumps and electrically driven high-pressure rotary pumps. The advantages and disadvantages of the two types are shown in detail. As regards the ventilators the chief attention is presently fixed on the problem of finding means of regulating the quantity of air, and in connection with this problem the interest centres about the method of regulating through converters, whereby the energy presently wasted in regulating by means of a resistance inserted in the rotor current is utilised. A considerable improvement in the efficiency, combined with reduced speed of revolution, is hereby obtained. The important subject, the main shaft winding machine, is viewed from the point of safe working, first cost, and running expenses. In spite of the endeavours to find other arrangements, only installations after the Ward Leonard system can as yet be regarded as in every respect irreproachable. The most important details in connection with the question of safe working are mentioned, and some particulars are given demonstrating the reliability hitherto attained in this direction. As regards the first costs, it is important that a thorough comparison be made with other systems. The points which hereby come in question are discussed to some extent, and, at the same the question of placing the winding engine in the hoisting framework is particularly treated. Under running expenses, particulars are given illustrating the degree of efficiency attained by Ilgner installations, whereby the most important facts are the average yearly results obtained on basis of reports from the managing departments of mines. The reasons of the economical superiority of the electrical winding-engines, particularly those of the Ilgner type, are pointed out and explained.

Prof. Rateau (Paris) read a paper on **Exhaust steam and mixed-pressure turbines.** The first mixed-pressure turbines were made with two bodies, one for high and the other for low pressure; the present turbines comprise, in a single body, a range of high pressure wheels and another range of low pressure wheels; the exhaust steam enters an annular port between the two ranges. The regulation of these engines is not merely obtained by the speed governor, as in that way the steam from the accumulator would flow freely into the turbine, and its pressure would fall very low for high pressure operation; moreover, this method of regulation requires speed variations that would render impossible the parallelism alternators driven by mixed-pressure turbines with those of the other groups. Prof. Rateau solved the problem by causing the speed governor to act upon both inlet valves together, the latter controlling each other without acting on the speed governor. A spring tends to hold the low-pressure valve open, and, consequently, close the high-pressure valve. On the other hand, the low-pressure valve is subjected to the pressure variations of the accumulator as soon as said pressure sinks beneath a certain value. The movements it receives are, at the same time, transmitted to the high-pressure valve, which enables one kind of steam to be replaced by the other, without the speed varying.

Prof. Rateau then points out an objection that was made regarding high pressure operation of mixed turbines, and shows that by a suitable selection of the number of wheels, an efficiency can be obtained with these turbines which is equivalent to that of high-pressure turbines.

Underground Haulage was the subject of a paper by F. Tillmann (Saarbrücken). The author said that continuous-current overhead trolley locomotives had proved their economy, and more lately single- and three-phase mining locomotives had come into use. Accumulator locomotives were not quite as economical, but rendered electrical haulage available where overhead wires were not provided. Locomotives were confined to horizontal galleries, but electrical rope haulages would be used either on inclines or on the level, and were just as economical, or, in favourable conditions, even more so.

Another paper in this section by E. Stach (Bochum) discussed various designs of heat-storage tanks for the utilisation of exhaust steam.

New Electrical Colliery Plant.—An installation, including a Sulzer steam turbine-driven generator, has been inaugurated at the Deep Navigation Colliery of the Ocean Colliery Co. at Treharris for driving underground haulages and pumping plant.

Visit to Lindal Moor Mines.—On Saturday, June 25th, the members of the Cumberland Branch of the Association of Mining Electrical Engineers took advantage of the kind invitation of Messrs. Harrison, Ainslie & Co. to visit the Lindal Moor Mines, near Ulverston (Lancashire). The party were met by Mr. Leck, H.M.I. of Mines, and Mr. Butler, mining engineer to Messrs. Harrison, Ainslie & Co., and Mr. Batstone, chief electrical engineer, assisted by Mr. Hy. G. Denham and Mr. Hampson, piloted the party through the power-house. The plant comprises three turbo-generators having an output each of 795 kw. at 3,350 volts, and is practically all used for pumping purposes at the numerous ore mines in the vicinity. After inspecting the plant the visitors were entertained to lunch by the company. The visitors then proceeded to view some of the underground pumps. The next inspection will be to the Greenside Mines on Monday, July 25th.

GAS-DRIVEN GENERATING PLANT FOR COLLIERIES

A PAPER by Mr. R. Crawford and Mr. N. Moores entitled "Power Production at Collieries, with special reference to gas power and electrical centralisation," was read at the Dunfermline meeting of the Mining Institute of Scotland on June 11th. The authors referred to great waste of fuel which occurs at many collieries, mentioning that the amount used for power purposes at the collieries in this country averaged 7 per cent. of the total output. They spoke of the great reductions in the consumption which had already been made through the adoption of electrical pumping, ventilation, haulage, coal-cutting, &c., and the displacement of small steam units, and the work that had been done by the introduction of low- and mixed-pressure turbines so arranged as to utilise the large amount of exhaust-steam from the winding engines, and to a less extent from haulage and other engines about the colliery. They instanced the case of the Fife Coal Company, which has six mixed-pressure turbines at work, of a total capacity of 5,800 horse-power, and said that, under good conditions, assisted by a heat-accumulator, and a 29-inch vacuum, a low-pressure turbine will effect an economy of about 40 per cent. over the results obtained with a non-condensing reciprocating engine. Whilst a good deal of attention has been devoted to electrical centralisation of power at large collieries by means of exhaust-steam turbines, it is found, he continued, that much higher economies can be obtained by converting the fuel into gas for the purpose of driving gas-engine electrical-generating sets, from which energy would be transmitted at high tension to the machinery at outlying pits. It was in this direction, they thought, that colliery managers must look for the highest possible economies.

The Paper then proceeds to describe in detail various forms of gas-producer plant, including non-bituminous pressure plants, non-bituminous suction plants, bituminous pressure plants, and the more recently introduced bituminous suction plants, such as Messrs. Crossley's, with two separate fires, the first producing carbon dioxide (CO_2), containing the usual large percentage of volatile matter which would condense into tar if cooled. This gas is led off in the form of a down draught to the lower fire, which is kept supplied with coked fuel from above from which all the volatiles have been distilled. Here the carbon dioxide unites with a further supply of carbon and becomes carbon monoxide (CO), whilst the volatiles are converted by the high temperature of the second fire into fixed gases. The gases then pass on through scrubbers in the usual way, in which they are cooled and cleansed ready for use in the engine. The Mond plant was also described, with its bye-product recovery features, and was stated to be quite suitable for utilising colliery duff or gum-coal, screen-pickings, and inferior coal occasionally found stratified with the coal-seams, which in the ordinary course of the working of the seams is stowed as waste. The advantages of the flexible electric agent between the central station and the outlying collieries were too evident to be questioned, and in most instances this medium of power transmission would be preferable to the transmission of the gas in pipes to gas-engines working at the outlying pits.

The authors then proceed to work out an estimate for a 5,000-kw. gas-driven colliery generating station. Assuming coal of an average quality of 13,000 British thermal units per pound, and a gas-producer efficiency of 75 per cent., each pound of coal gasified will yield 9,750 British thermal units, available in the engine cylinder. Taking the consumption as 9,350 British thermal units, with a dynamo efficiency of 90 per cent., this is equivalent to 1·42 pounds per kilowatt-hour at the switchboard; and with duff at 2s. per ton, this shows a fuel cost of 0·015d. per Board of Trade unit. The capital outlay involved in a gas-power station of 5,000 kilowatts, comprising Mond gas-plants with ammonia-recovery apparatus, multi-cylinder gas-engines of, say, 1,000 kilowatts each, direct-coupled generators, buildings, foundations, &c., is approximately £17 per kilowatt, or a total of £85,000. Such a plant, working on a load-factor of 60 per cent., would generate 21,600,000 kw.-hours per annum, during a working year of 300 days of 24 hours each. An allowance of 15 per cent. will cover interest, depreciation, and insurance, and a sum of £4,600 has been set aside for labour, acid, stores, and renewals. The coal consumption on 21,600,000 units at 1·42 pounds per kilowatt would be 13,692 tons per annum costing £1,369. On this basis the cost of production is found to be 0·20d. per Board of Trade unit at the switchboard, from which the bye-product revenue must now be deducted. Assuming a yield of 95 pounds of sulphate per ton of coal gasified, the recovery would be 585 tons per annum. This represents, at £11 10s. per ton, the sum of £6,727, whilst the yield of tar might be expected to realise a further £584. On deducting these amounts from the gross cost, the net cost of electricity will be found to work out at the very low rate of 0·12d. per kilowatt-hour. This would be still further reduced to 0·11d. per unit if screen refuse were used instead of duff.

The Paper then deals with the utilisation of waste gas from coke ovens, and a case is worked out where not only is power obtained for nothing, but a profit, representing a return of 50 per cent. of the capital spent on the undertaking, is obtained.

ELECTRICAL POWER IN A FRENCH COLLIERY

AN account is given in *l'Electricien* of an electrical power equipment at the Portes and Sénéchas Mines at Alais, in the Gard district in France. The general arrangement of the pits in question is somewhat peculiar, and in former times the pumping was done by steam, and the boiler-house, which was at the surface, was connected to the underground pump-room by steam pipes over 1,600 ft. in length taken down an inclined gallery. The exhaust steam was also taken up the same gallery. Owing to the excessive condensation, the efficiency of system was very bad, and owing to the high temperature which the gallery attained, there were great difficulties in keeping the joints in order. It was this that influenced largely the decision in 1901 to adopt electric power, first for pumping and latterly for other services in the group of mines of which this is one.

The central station contains two 110-kw. steam-driven alternators, and a similar set for 300 kw., all generating at 1,000 volts three-phase 46 cycles. The two smaller machines are provided with heavy flywheels to assist in load equalisation. A Tirrill regulator is employed to keep the voltage constant, and it is stated that this has been very successful in screening the system from the effects of the variable demand of the winding plant. For surface lighting and auxiliary power purposes, a transformer reduces the supply pressure to 110 volts.

The principal purposes for which electric power is now used include the main shaft winder of the central pit, the underground pumps already referred to, a ventilating fan, a washing and screening plant, and an underground auxiliary winder for sinking. Transmission on the surface is partly by cable and partly by overhead lines.

The head of the main shaft of the central pit does not rise directly to the surface, but is connected to an opening at the foot of a hill, under which is the shaft, by a horizontal gallery 2,300 ft. long. There was formerly a steam winding plant at this underground shaft-head, worked by underground boilers, but afterwards on account of a serious explosion, supplied with steam through pipes along the gallery from a surface boiler-house. In 1907, however, when further sinking of the shaft was to be carried out, winding plant of increased capacity was required, and the opportunity was taken to adopt electrical working. The winder was electrically equipped by the Allgemeine Elektricitäts-Gesellschaft, and is driven by a three-phase induction motor through single reduction spur gearing. The winding drums are of the narrow form to accommodate a flat rope in a single spiral series of layers, an arrangement much favoured in France and Belgium. A normal load of 3 tons per wind is hoisted from a depth of 1,215 feet, and the rope speed is 19·7 ft. per second. No load equalising device has been thought necessary, and the speed regulation is effected by a liquid rheostat in the rotor circuit. The electrolyte is kept in constant circulation by an electrically-driven pump, and the resistance is varied by altering the level of the liquid while the plates are fixed. Cooling water pipes are provided in the electrolyte. One lever controls the supply, interruption, or reversal of current, to the stator, and at the same time regulates the speed by acting on the valves admitting the liquid to the rheostat tank, and the rate of acceleration is limited by the capacity of the pump. A second lever controls the brakes, which are applied by a counterweight, and held off by compressed air. A voltmeter, an ammeter, a pressure gauge, and a Karlik speed recorder are placed immediately in front of the driver, and the last-mentioned is fitted with alarm bells, which can be set to ring immediately the maximum speeds allowed for winding coal or men respectively are exceeded. The depth indicator carries a catch, which automatically returns the control lever to the off position when the cage is approaching the surface, and a further catch prevents overrunning by breaking a control circuit, and thus opening the main circuit, and at the same time opening the brake air valve. In case of emergency the driver can produce the same effect by means of a pedal. Failure of the current supply also applies the brake in a similar way, and another feature of the arrangement is the provision of a pedal which prevents accidents due to the driver leaving his post during a wind, as its release interrupts the current and applies the brake. A further safeguard against overrunning is found in a limit switch actuated by the cage itself. It should be remarked that in this system, the three-phase winding motor gives a braking action automatically, and returns power

Digitized by Google

to the line as soon as there is any rise of speed above synchronism.

Electric pumping is also employed for drainage. The oldest set is a three-throw pump running at 60 r.p.m. through gearing, and a flexible coupling by a 120 h.p. 1,000-volt induction motor, which runs at 457 r.p.m. This set has a capacity of 2,400 galls. per hour, against a head of 650 ft. The other set is a Rateau centrifugal high-lift pump, capable of raising 2,500 galls. against the same head, and direct driven at 2,735 r.p.m. by a Boucherot three-phase motor with two stators. Tests have shown an overall efficiency of the older set of 79 per cent, against only 68 per cent. of the centrifugal pump and motor, but the convenience of the latter in the matter of small space occupied and light foundations required, together with the decreased cost of attention and maintenance, give it considerable advantage. Similar centrifugal pumps of slightly smaller size are used in the north and south pits.

There is a small auxiliary winding engine for sinking purposes lower down the main shaft of the central pit, and this is also driven by a Boucherot double stator motor. Further applications of electrical power comprise the driving of the main fan of the central pit by a 120 h.p. induction motor through a belt, and the plant for washing, screening, &c. In the latter case the entry of dust into the motors is carefully guarded against, and the motors are situated in separate rooms. There is also an electromagnetic separator for removing pieces of iron from the broken coal passing to the briquette factory, which used to give considerable trouble. Various other small motors are run from the 110-volt circuit, which also supplies the surface lighting. The centralisation of the power supply has been found to result in economy of a kind impossible before.

ELECTRIC POWER IN COLLIERIES

A PAPER by Mr. F. Anslow, entitled, "Some Considerations affecting the installation of Power at Collieries," was among those discussed at the meeting at Dunfermline of the Mining Institute of Scotland, on June 11th. Mr. Anslow, in dealing with existing steam plants at collieries, said that these were often destitute of condensing plant, partly on account of difficulties in running winding engines condensing, but he showed that in most cases, except where increased power is required, the cost of adding condensers to improve the economy was not justified. Where extensions are required, however, condensing plant and exhaust, or mixed pressure turbines driving electrical generators, will render considerable extra power available without extra steam being required from the boilers. Details were given of a case where an extra 500 kw. was thus made available. Even where a large proportion of steam plant is already condensing, considerable extra power can be obtained by the installation of mixed pressure turbo plant, and particulars were given of an example to illustrate this.

Passing on to speak of the electrical system to be employed, the author said that in certain parts of England and Wales some advantage might conceivably be gained by converting some of the existing direct-current systems into alternating; but in Scotland the conditions were different, and attention should rather be concentrated upon the question of rendering existing installations safer. Accidents due to the iron supports which were in common use in Scottish mines becoming live were too frequent.

Mr. Anslow then reviewed several general points concerning electrical installations in mines. The possibility of shock, he said, could be comparatively easily eliminated in all generating, motor, and other plant by earthing, with the exception of coal-cutters, which were more difficult to deal with. The greatest danger of shock, however, was from the cables, and this is particularly prominent in Scotch mines, owing to wet, and the low seams which leave little room for the cables. Armoured and unarmoured cables both possess advantages; whichever type was adopted, great care in the installation thereof, with constant supervision afterwards, was the essential and only safe manner of dealing with cables, if fatal accidents were to be avoided.

With regard to automatic protective switchgear, he thought that it was better to rely on constant supervision and the "man" element, than to be lulled into false security by devices which may fail when required. To earth or not to earth, he continued, is at present a great question, and there are many advocates both for and against. Too frequently, however, it is answered by a most unhappy compromise of partial earthing. If earthing be attempted, it must be carried out effectively, and, generally speaking, two main earth-plates should be employed, one on the surface, and one below-ground, in the shaft-sump or other suitable position. These two plates should be connected together by a main wire, which should run the full extent of the installation, and all electric apparatus and metallic work in connection therewith should be connected to it by wires of suitable section. The alternative of a number of local earth-plates is sometimes preferred. The difficulty in this system is to obtain a good earth, and the main wire would appear to offer on the whole the best solution.

Passing on to the relative advantages of continuous and alternating current, he spoke of the superiority of continuous current working for winding engines, especially in the larger sizes, where an energy equalising system was usually necessary. For fans and pumps either system is suitable, but where variation of speed is required, the former is preferable.

Haulage-gears can be operated by either system with equally satisfactory results. From a working point of view, direct-current coal-cutters are superior to those operated by alternating current, but the latter type has proved itself quite reliable and satisfactory in working. Reference was also made to the working of groups of compressed air machines supplied by an electrically-driven compressor near by.

Discussion.

Mr. R. A. Muir (General Manager of the United Collieries, Ltd., Glasgow), said that they had found exhaust steam turbines at one colliery a valuable acquisition. They were used in conjunction with winding engines, as electricity was generally most required during the hours when the winding engines were most used. Among improvements made in exhaust steam plant of late years was the addition of the impulse type of blading to the original Parsons pressure blading with the consequent reduction in length and size generally. Mr. Muir had had no experience with gas at any of his colliery works, but he was quite certain that if he had gas he would not employ a gas engine, but would burn the gas under the boilers and use steam turbo-generators. His own electrical experience had been almost entirely with three-phase work, and he agreed entirely with Mr. Nelson's preference for three-phase supply and armoured cable. He thought that for pit work the employment of good armoured cable, well earthed throughout, was the safest system to adopt. While he agreed that working in thin seams might lead to the adoption of direct-current coal-cutters in preference to three-phase occasionally, he still thought that it would soon become possible to get three-phase machines for any class of seam. Mr. Muir referred to the occasional difficulty of getting a converted private plant to fit in with the system of a supply company, especially in the cases in which the supply company had adopted an abnormally low periodicity. His experience had been that in colliery work the greatest difficulty one experienced with either D.C. or A.C. work was with the switchgear, which, as a rule, did not long stand the onerous conditions satisfactorily, and he thought that makers had still some distance to go in this respect. Controllers also were usually a source of constant trouble, and should be constructed so as to be water-tight, and yet provided with means for carrying off any heat generated in enclosed resistances.

Mr. E. Gray (Lumphinnan Colliery, Fife Coal Co.), spoke briefly on the difficulties of earthing coal-cutters satisfactorily, and Mr. Harold Moores asked a question relating to the efficiency of a combined reciprocating and turbine set.

GOVERNMENT CONTROL AND INSPECTION OF MINES

ON Thursday, June 16th, the attention of the House of Commons was occupied with the question of inspection of mines in connection with the Civil Service Estimates. The subject was introduced by Mr. E. Edwards, who urged that the number of mining accidents called for a more vigorous enforcement of the mining laws, augmentation of the number of inspectors, establishment of rescue stations in every district, and encouragement by the Government of experimental research. A number of members spoke in favour of an increase in the inspection staff, and the granting of a special sum for conducting experiments as to the causes and results of explosions, as asked for by the Royal Commission. Mr. Atherley Jones, in particular, asked that steps should be taken to allay the dangers from coal dust in mines, as this was a frequent cause of explosions. The use of electricity in mines should also be carefully watched. He enlarged upon the dangers in connection with coal-cutter trailing cables.

Mr. Winston Churchill, in replying to the debate, after referring to the Whitehaven disaster, said that the Royal Commission was still at work on the subject of coal dust. As to the recommendations contained in the reports of the Commission already issued, they would, with many others designed to secure general safety, have to await a new Coal Mines Regulations Act. A Committee was at work with a view to revising existing regulations on the use of electricity in mines. The Royal Commission was unanimous in recommending that the staff of inspectors should be strengthened. He was prepared to take steps to strengthen the inspectorate, and he hoped to announce without delay an outline of the steps to be taken in that direction.

Mr. Markham, in referring to the question of electricity in mines, asked whether legislation would be necessary to give effect to the recommendations of the Committee considering the subject, to which Mr. Churchill replied that no effect could be given to their recommendations by making new orders under the existing Act. Mr. Edwards finally withdrew his resolution.

HUCKNALL COLLIERY BATTERY PLANT

At the meeting of the Institution of Mining Engineers in London on June 2nd last, a Paper was read by Mr. W. Maurice, general manager of the Hucknall Torkard Colliery, Notts, describing the storage-battery plant at that colliery. The battery plant is used for the supply of direct current in a pit (No. 1 Pit) in which the original small D.C. generating plant had become insufficient to cope with the load, and the power transmitted to the battery plant is the surplus from a generating plant supplying a three-phase system in another (No. 2) pit about 1¼ miles distant. The accompanying diagram shows the arrangement. The 110-kw. Rateau exhaust-steam plant, *A*, generates three-phase current at 500 volts, and supplies underground haulage gear in No. 2 Pit with a fluctuating load varying between zero and the full output of the generator. A 90-kw. transformer, *B*, steps up the pressure to 3,000 volts, and the surplus power is transmitted over an overhead line to No. 1 pit, where it is converted to direct current by means of a motor-generator set. This consists of a 3,000-volt synchronous motor, *D*, coupled to a 50-kw. 500-volt compounded D.C. generator, *E*. A Lancashire reversible booster, *F*, for automatically regulating the working of the battery, is coupled to the same shaft. The battery, *G*, consists of 240 Tudor cells with a total capacity of 400 ampere-hours on the 10-hour rate, or 236 ampere-hours on the 1-hour rate. Provision has been made for a 50 per cent increase in capacity by placing the nine plates of each cell in

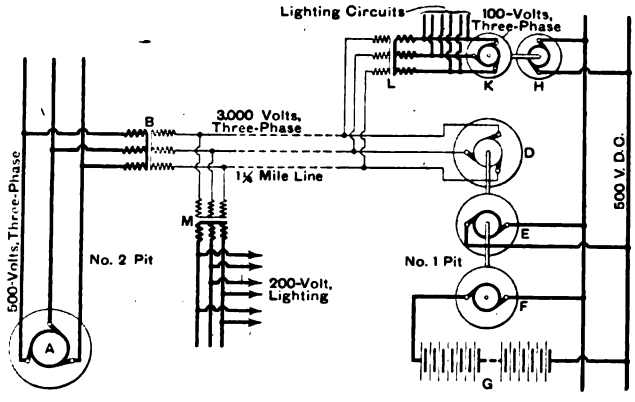

Diagram of Connections of Generating and Battery Plant.

glass boxes of sufficient size to contain 13 plates each. For the purpose of supplying the A.C. lighting loads of both pits from the battery when the generator, *A*, is shut down, a small motor-generator set, *H*, *K*, has been installed. *H* is a 500-volt D.C. motor, and *K* is a 5-kw. 100-volt three-phase generator connected to the H.T. line through a transformer, *L*. The lighting circuits at No. 2 Pit are supplied at 200 volts A.C. through the 3,000/200-volt transformer, *M*, and those of No. 1 Pit and of the adjoining offices and private houses are supplied at 100 volts A.C. from the generator, *K*, or through the transformer, *L*, when the main generator is running. The small original D.C. generating set in No. 1 Pit has been retained, and is electrically connected to the battery plant; this machine is generally used as a motor to drive a 36-in. circular saw, but it can be driven as a dynamo by the original steam engine, and then assists the battery plant.

During the time when the generator, *A*, is running—usually 16 hours per day and five days per week—the generator set, *D*, *E*, *F*, also runs, the generator supplying the power-load at No. 1 Pit, and at the same time charging the battery through the booster, *F*. Whenever the haulage-load on set *A* increases, the motor-generator tends to drop its load, and the charging-current supplied to the battery falls off. In case of a heavy overload on the haulage, the motor-generator reverses, taking current from the battery and supplying power back to the generating station to assist the generator, *A*. Any fluctuations in the power-load at No. 1 Pit are meanwhile taken care of by the automatic reversible booster, so that all the fluctuations are taken up by the battery, the output of the [illegible] current generator not being affected. Thus the gener[illegible] *A*, is kept running at or near full load; the mot[illegible] supplies power to No. 1 Pit, and any surplus is [illegible] battery. When the battery is fully charged, th[illegible] set is shut down, and the power-load at [illegible] from the battery for the remainder.

The motors on the three-phase [illegible] a 50-h.p. endless-rope haulage gear, two 30-h.p. haulage gears, a 15-h.p. saw, and several small machines; including a motor-generator for working the underground signals. There are also about 280 16-c.p. incandescent lamps. The direct-current motor-driven gear in the No. 1 Pit comprises three 15-h.p. coal-cutters, a 40-h.p. emergency winding set, a 20-h.p. haulage gear, four 10-h.p. screens, a 10-h.p. workshop motor, and six smaller motors. Some 250 16-c.p. lamps are connected. The total rated horse-power installed in the two pits is about 300. The installation has now been in daily operation for a year and a half, with entirely satisfactory results.

Discussion.

Mr. W. C. Mountain (Messrs. Ernest Scott & Mountain, Ltd., Newcastle), pointed out that credit was due to Mr. Maurice as being one of the first to introduce exhaust steam turbines. It was interesting to see that the 300 h.p. of motors installed could be supplied by the one 100-h.p. generator. The system adopted was inevitable in view of the D.C. machines already in use, and the desire to store the surplus energy. He would like to see the load-curve of the battery; he estimated that it could deliver 20 h.p. for 10 hours, 50 h.p. for three hours, or 119 h.p. for one hour. Personally, he would not care to put a battery into a colliery. Five or six years ago a battery in a German colliery, which cost £9,000, had to be scrapped after less than one year's working. The efficiency of the Hucknall plant did not seem to be very high. Assuming 15 per cent. loss in the generator, 10 per cent. in transmission, 15 per cent. in conversion, and 20 per cent. in the battery, the overall efficiency at full load came out at only 52 per cent. Finally, he asked Mr. Maurice for figures of output, input, cost, and upkeep. He doubted the benefit of using a battery unless it were in the hands of a really competent man.

Mr. D. Selby Bigge suggested that it would have been more economical to increase the turbine generating plant, providing that there was more exhaust steam available, using a motor-generator to supply the D.C. motors in Pit. No. 1. The first cost of such a plant would, he thought, be immeasurably less than that adopted, which must have a very high cost per kw. It showed, however, how the energy of exhaust steam could be stored when it was not wanted.

Mr. G. C. Allingham said that the extensive use of the three-phase system was largely a fashion, and he welcomed the Paper as it showed there were special advantages in the D.C. system. It was impossible to store electrical energy without first converting to direct current. Mr. Mountain had stated that a battery needed a highly competent attendant; he knew of many cases where small storage batteries were working very satisfactorily without skilled attention. In some cases, on A.C. systems, it had been found advantageous to convert to D.C. for storage, and back again to A.C. for use. The reason why additional turbine plant had not been put in seemed to be that exhaust steam was not available all day and on every day of the week.

Mr. W. Maurice stated that he would give the information asked for by Mr. Mountain in his written reply. He mentioned, however, that though more exhaust steam was available, he did not put in additional turbine plant, as it would have cost very much more than the battery plant, including the transmission line. He had arranged with the Tudor Co. for a ten-years' maintenance contract at a very low rate, and that fact rather disposed of the arguments against the satisfactory working of the battery. He did not think that the cost per unit generated was of much importance in colliery work.

Lancashire, Cheshire, and North Staffs of the A.M.E.E.—On June 3rd the Hulton Collieries were visited, including the new pits at Atherton. Mr. Tonge and his assistants conducted the party over the works to view the electrical plant. At the close of the visit a vote of thanks was passed to Mr. Tonge and the directors for their kindness. June 4th was set apart for visiting the Manchester Corporation electricity works (Stuart Street), and the Manchester School of Technology. Here, also, a very pleasant and instructive time was spent. A very able guide was found at the electricity works in Mr. Wallis (a member of the staff), who was always ready to explain the numerous pieces of mechanism used there. At the School of Technology, Mr. Shaw, who is one of the demonstrators in electrical engineering, took the party in hand, and explained each instrument used in the various branches of electrical engineering.

EARTHING OF COLLIERY APPARATUS

AT a meeting of the Warwickshire and South Staffordshire Branch of the Association of Mining Electrical Engineers, on Saturday, June 4th, at the Imperial Hotel, Birmingham, Mr. J. B. ENGLISH (Walsall Wood), gave the results of some experiments in connection with the earthing of coal-cutters. The system he used was two-wire D.C., with a pressure of 440 volts between the conductors. The insulation of the positive main was 110,000 ohms, and of the negative 55,000 ohms. Between the positive and the machine frame the potential difference was 25 volts, and between the negative and frame 16 volts. With the positive terminal to frame 7·0 milliamperes passed to earth, and with the negative terminal to from 4·7 milliamperes. It was remarkable that, when a special earth wire was run to earth, the frame, no difference was found in the results given above. As a result of a further experiment it was found that a spike 12 inches into the ground afforded an earth of lower resistance than a plate. With the negative cable efficiently connected to earth, and the positive direct to the frame of the machine, the current passing to earth was 5 amps.; with the positive connected to the plate 0·05 amp. passed, and with it connected to the spike 7 amps. passed. When the positive cable was connected to the frame, the potential difference between the frame and a plate laid in the ground was 390 volts, and between frame and a spike driven into the ground, 420 volts. He drew the inference that if the insulation of a D.C. system is good there is no need for earthing, but as it is impossible to ensure good insulation throughout a mine, it is advisable to efficiently earth both portable and fixed machines. As regards the method of earthing, armoured cables were advocated by many, the armour

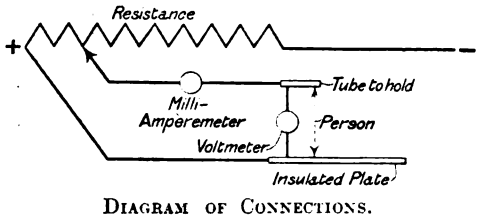

DIAGRAM OF CONNECTIONS.

being used as earth wire. In his opinion armoured cables were unwieldy and wanting in flexibility; the insulation was also liable to be pierced by the armour. He preferred providing a separate earth wire wormed up with the conductors, the whole being protected by a braiding of leather or cord. He had found cord both durable and very flexible.

Mr. W. FOSTER then read a Paper entitled "A Few Notes on Earthing." He started by describing the measurements he had made to determine the maximum pressure permissible in the earthing system. The arrangement is shown in the figure. The variable resistance had a value of 200 volts, and the pressure of the circuit was 500 volts D.C. The first reading was taken as soon as the person felt the current, and continued until the maximum was reached, which the person would stand voluntarily. Seventy-two tests were made. A few samples of these are given below :—

Volts.	Amps.	Ohms.
110	0·12	916
74	0·22	336
55	0·3	183
36	0·25	144
32	0·3	107
16	0·072	222

Each person's resistance had fallen towards the end of the test, owing, probably, to the perspiration on the hand. Seeing that a person would not stand voluntarily more than 32 volts, at which pressure he was taking 0·3 ampere, it appears inadvisable to allow of a greater potential difference between earthed metal work and earth of more than 50 volts.

The author then proceeded to discuss the earthing on different systems. In the two-wire insulated D.C. system, if one fault only occurs, the system balances itself about this fault, and no interruption is caused in the working; but should a second fault occur, there is a short-circuit across the system. With the concentric system any fault, as a rule, causes a short-circuit. A three-wire D.C. system with neutral insulated is similar to the two-wire, but a reduced pressure is applied to the short-circuit. A three-phase system, with all three phases insulated, is like the two-wire D.C. system, and a three-phase system neutral earthed corresponds to the three-wire D.C. system. He did not approve of the system of finding one good earth and making connection to it. In his opinion a well-distributed earth system was best, more especially if protective apparatus was employed to isolate faulty sections, such apparatus requiring only a small current to operate it, and inserting only a small resistance in the earth connection.

Mr. ENGLISH, in discussing Mr. Foster's Paper, agreed with his recommendation to distribute the earth connections as generally as possible. He further stated that, in his experience, 800 ohms was the lowest resistance of a human body under similar conditions to those described in the Paper.

ELECTRICAL MINING PATENTS OF JUNE

AMONG the patents published last month of especial interest to mining electrical engineers may be mentioned one of Messrs. Mavor & Coulson and S. M. Mavor (No. 11,206 of 1909), covering mechanical details of electrical coal-cutters, and one by C. F. Spery and E. F. O'Brien, both of Chicago, for rendering the caps of blasting fuses watertight by a simple species of gland. A curious specification is No. 7,556 of 1910 of Otto Böhm (Berlin), in which he describes an electric mining locomotive fitted with a device whereby the current is automatically cut off from the motor when the locomotive approaches a stationary truck or other obstacle. There is a long spring plunger or buffer projecting from the front of the locomotive, which, when driven in by contact with an obstruction, opens a switch in the motor circuit. When the obstruction is removed, the plunger springs out again, closes the switch, and restarts the locomotive. The exact means whereby the starting resistances are controlled are not described. The arrangement is evidently intended to dispense with a driver on the locomotive. Another patent for blasting appliances is No. 16,709 of 1909, by Nobel's Explosives Co. This covers improvements in the construction of magneto or dynamo shot-firers of the class actuated by a travelling nut, which causes a threaded spindle to rotate. The improvements lie chiefly in the method whereby the circuit is only closed when the armature has nearly completed its movement. In specification No. 23,144 of 1909 a miner of Gwaun-cae-Gurwen, Glamorgan, named David Lewis, patents an electric ignition apparatus for safety lamps, in which contacts are arranged on the sliding door of the lamp chamber to prevent the ignition circuit being completed before the door is closed.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during June.

June 2nd.—Supplement on "Electrical Engineering in Mines," opening with an article by a colliery electrician on signals and telephones in mines. Reports are given of meetings at some of the branches of the Association of Mining Electrical Engineers, including an abstract of a Paper on "Colliery Cables," by Mr. W. J. Richards, discussed at Cardiff. Other Papers read before societies include an account of the electrical equipment of Murton Colliery, and an interesting description of a large exhaust steam turbine plant at a German colliery. Notes are also given on the causes of some recent colliery accidents.

June 9th.—Notes on the electricity supply systems of Glasgow and Edinburgh, a Paper on the development of high-tension switchgear.

June 16th.—An interesting letter on high-tension switchgear.

June 23rd.—Discussion at the Glasgow Convention of the Incorporated Municipal Electrical Association on exhaust and mixed-pressure turbines. Notes on the prevention of electrical accidents in factories from the report of H.M. Electrical Inspector of Factories.

June 30th.—Account of some of the Electrical Engineering Exhibits at the Brussels Exhibition. Description of a new system of low-speed electrical drive without mechanical gearing.

Newcastle Branch of the Association of Mining Electrical Engineers.—A diversion from the usual proceedings of the Association of Mining Electrical Engineers was made on Saturday, June 25th. A large party of the members of the Newcastle Branch and their lady friends took part in an excursion to Ripon and Fountain's Abbey. Luncheon was held at the Unicorn Hotel, Ripon. Dr. Thornton (in the chair) expressed a few encouraging remarks concerning the objects and work of the Association.

Recent Colliery Accidents.—An inquest was held early last month into the death at Glamorgan Colliery Llwynypia, of E. Abbott, Tonypandy. The accident was due to a horse drawing two trams at the brickyard fouling two stay wires supporting a derrick, thereby causing the breakage of an insulation on the derrick, so that the stay wires became live. Not only was the horse killed, but it appears that the trams also became live, for the deceased, who was holding on to the last tram, received a shock which proved fatal. The man driving the horse also received a shock, but recovered from its effects. The rubber covering of the cable is reported to have been defective, and it is believed that there was sufficient surface leakage over the insulator to cause the horse to plunge and fall across the stays, finally breaking the insulator. A verdict of accidental death was returned. Another electrical mining fatality about the same time occurred at Newland Collieries, Normanton, when H. Colburn was killed by a shock from a haulage rope which had apparently become live through leakage from a coal-cutter working in a very damp place.

SMOKE "NUISANCE"

ON Wednesday of last week a deputation, principally under the auspices of the Smoke Abatement League of Great Britain and the Coal Smoke Abatement Society, and including representatives from some nineteen towns, was received at the Local Government Board offices by Mr. John Burns.

The memorial which was presented dealt in rather extravagant language with the effects of smoke and its resultant gloom upon the inhabitants of cities. It even attributed the evils of drink and gambling to this cause, and claimed also that the spread of consumption was facilitated by the prevalence of smuts preventing the sufficient opening of windows.

It was asked that the provisions of the control of smoke embodied in the recently introduced London County Council's Bill—which, by the way, have not been accepted by the House of Commons Committee considering the Bill—should be made applicable to the whole country, and that fines should be made high and cumulative, as they are in Leeds and London. The creation of a special Smoke Department of the Local Government Board, with "competent" inspectors, whose duties should include advice and assistance, and not merely instigation of prosecutions, was also suggested. Although chiefly directed against the works chimney, the memorial also dealt with domestic smoke, and proposed official inspection of all new fireplaces and the encouragement of cheap gas supply by the prohibition of "the pernicious practice of selling gas dear to relieve the rates."

Mr. Burns, in his reply, expressed sympathy with the objects of the deputation. He believed that a smoky chimney was a sign of waste, an evidence of defective combustion, and a proof of bad stoking. He believed that much improvement could be accomplished if employers would give practical and technical instruction to their stokers, and afterwards some little encouragement in the shape of a shilling or two a week in extra wages. Legislation as it at present existed, with the exception of Nottingham, struck only at the factory, the workshop, and large undertakings. He agreed that legislation should be made possible in many of the directions indicated, but in the matter of domestic houses—the chief cause of the nuisance—he anticipated more from general progress than from legislation. He looked to the increasing use of electricity and gas for heating and cooking to reduce the smoke nuisance in London, and expressed the hope that the day was not far distant when manufacturers would be able to obtain power for their factories and workshops from some central institution, where combustion could be much more easily controlled than it now is in the smaller units.

With Mr. John Burns' suggestion that electricity should be used for heating in place of the domestic grate we cordially sympathise, but we have no sympathy with the cranks of the Smoke Abatement League and the Coal Smoke Abatement Society, who insist, in season and out of season, on the persecution of the owners of works chimneys. It is to the interest of manufacturing firms for economic reasons to effect perfect combustion in their furnaces, but a time when the engineering industry is endeavouring to emerge from a period of slackness of trade is the wrong moment to choose to force manufactures to incur heavy expenditure on the rebuilding of their furnaces. The campaign against electricity work is little short of ridiculous. It is the existence of these works, and not the activity of the smoke abatement societies, that has done the most to mitigate the smoke "nuisance" during the past decade. Much of the coal which would otherwise still be burned inefficiently and smokily in numerous factories, locomotives, and even private houses is now being consumed at electricity works which furnish them with power; it is obviously consumed with less total smoke, and the smoke is not spread over so wide an area. The Smoke Abatement League, the Coal Smoke Abatement Society, and also the municipalities who are said to support their proposals, should realise that the harassing of electricity works by more regulations and control, and by the imposition of heavy fines, will have the effect of keeping up the price of electrical energy and so impeding the "electrification," which, as we have said, does more to further the objects of the League than its own actions.

National Electrical Manufacturers' Association.—A Committee Meeting will be held at Balfour House, Finsbury Pavement, London, on Tuesday next, July 12th, at 2.30 p.m.

CORRESPONDENCE

TELEPHONES FOR THE ANTARCTIC EXPEDITION.

To the Editor, ELECTRICAL ENGINEERING.

DEAR SIR,—In reference to the interesting account appearing in your issue of the 30th ult., entitled "Telephones for the Antarctic Expedition," we may mention that the 24-volt batteries referred to in the article are of the "Exide" type, and were supplied by us. It is interesting to recall that a previous Antarctic vessel, the *Discovery*, carried a battery of "Chloride" accumulators, and one of the cells can be seen on our stand at the Japan-British Exhibition.

Yours faithfully,
THE CHLORIDE ELECTRICAL STORAGE CO., LTD.
W. S. NAYLOR,
General Manager.

Pendlebury, near Manchester, July 1st, 1910.

AN ELECTRICALLY OPERATED GOODS CLEARING HOUSE

AT the London Chamber of Commerce on Wednesday last week, Mr. A. W. Gattie, Chairman of the New Transport Co., explained his scheme for the erection of a goods clearing house for London, on the principle of the bankers' clearing house. Mr. Gattie proposes to acquire a large slum area in Clerkenwell at a cost of £1,500,000 and to construct a few miles of railway, so that all railways could run into the Clearing House. The total cost of the scheme is put at £6,000,000. The electrical interest of the scheme is in the equipment of the proposed building, which has been reported upon favourably, after an examination of the drawings and details, by Sir William Preece and Messrs. R. Waygood & Co., Ltd. A system of distributing the goods in the Clearing House has been designed by Mr. Gattie, in conjunction with Mr. A. G. Seaman, of the British Westinghouse Co., Ltd., and is described in specification No. 17,344 of 1908. A trench, forming a sub-basement beneath the railway lines serving the Clearing House, is furnished with a number of slow moving, electrically driven platforms, each of which is set apart for a particular company. Encircling these moving platforms is a faster travelling main platform. The parcels to be conveyed to any particular receiving company of the depôt are placed in small trays mounted on castors, which are placed upon the main platform. Every link of this platform is provided with electrically driven rollers placed at an angle, which can, at the desired moment, be magnetised so as to adhere to the bottom of the tray, and at the same time start rotating, thereby shooting the tray bodily off the main platform on to the slower moving distributing platform which serves the particular company required. In like manner any tray can be shot off the distributing platform into the division of the company required. The selection of the points at which the tray leaves each platform is governed by a somewhat intricate controller, which is set by the attendant to the number corresponding to the bin to which the parcel is to be sent. The remaining operations will be performed by electric cranes. A controller is fitted to each working section of the conveyor. This conveyor has been successfully made by Messrs. Reason & Co., Ltd., of Brighton, and has been tested by Mr. Christopher Silver, chief of the Testing Department of Faraday House.

The Constantinople Telephone Contract.—The telephone concession for Constantinople and district granted to Mr. H. L. Webb of London has now been ratified. The concession is for 40 years, but the Government has the right to purchase at the end of 10 years. The undertaking is to be completed within two years. It will be remembered that the National Telephone Co., the American Bell Co., the British Thomson-Houston Co., and the Western Electric Co. are interested in the scheme.

The Electrical Committee.—The Hon. Arthur Stanley, M.P., has accepted the position of President of the Committee for the Protection of Electrical Interests. Mr. R. Hammond has agreed to act as Vice-President, Mr. A. H. Preece as Honorary Treasurer, and Mr. R. Borlase Matthews as Honorary Secretary. The following additional members have been elected: Messrs. Chas. Bright, F.R.S.E., J. Connolly, E. Manville, J. H. Rosenthal, and F. Ince. A meeting was held yesterday, and it has been arranged that for the present the Committee shall hold fortnightly meetings on alternate Wednesdays at Faraday House, 66 Southampton Row, W.C. Endeavours are to be made for the formation of a Parliamentary Party in the House of Commons to represent the electrical interests. The Committee wish to work in co-operation with other existing associations and societies, and all questions which, in their opinion, can be dealt with by other associations are referred to them. A number of subjects have been brought before the Committee for consideration, and further suggestions are invited.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published June 30th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

13,080/09. **Meters.** EVERSHED & VIGNOLES and S. EVERSHED. In these watt-hour meters of the motor type, freedom from errors due to stray magnetic fields is secured by an astatic arrangement of the main current coils, which act upon a flat shunt-wound armature. Internal connections are minimised by the use of the metal coil formers as terminals, and easy means of adjusting the constant of the meter is provided by shifting the positions of the coils. Five claims, five figures.

13,228/09. **Tubular Incandescent Lamps.** C. O. BASTIAN. The tubular lamps described may be of considerable length, and have a terminal cap at each end. The filament is made up of several short lengths in series, connected together with springs capable of keeping the filament tight, in spite of expansion. Each spring has its central convolutions of nearly the internal diameter of the tube, so that, although not attached to, it touches the glass. Support is thus given to each section of the filament without sacrificing freedom for longitudinal movement. Three claims, ten figures.

13,237/09. **Resonance Instruments.** W. H. JOHNS and JOHNSON & PHILLIPS, LTD. In these instruments the indications are rendered clear by providing each vibrating end with a shutter or flag which normally covers a figure on a fixed scale. When a reed is thrown into vibration, the figure is intermittently uncovered and becomes visible. An auxiliary magnet can be employed to catch the reed which has moved, and hold it permanently deflected with the corresponding figure uncovered. Five claims, seven figures.

13,265/09. **Stage Arc Lamp.** T. FRANCIS. A hand-regulated stage arc lamp in which the carbons are held at the long ends of bell-crank levers; the short ends of the levers overlap, and are pressed against the point of a screw by a spring. The screw can thus be employed to move the carbons together and apart. An important feature of the arrangement is that the lengths of the short overlapping ends of the levers can be proportioned in accordance with the relative rates of burning away of the two carbons, so that approximate focussing is secured. One claim, one figure.

13,576/09. **Cable Covering.** T. H. M. HARVEY and J. W. BASS. Additional locking strands are run longitudinally in a more or less zig-zag fashion over and under the strands of the ordinary helical braiding to prevent unravelling. Five claims, two figures.

13,827/09. **Heating Appliances.** C. O. BASTIAN. This specification covers the use of a number of short heating elements, consisting of conductors enclosed in short tubes, sleeves, or beads of quartz, all in series. One claim, four figures.

14,965/09. **Excess Voltage Indicator.** V. ARCIONI. This is an alternating-current induction relay in which a spring-controlled metal disc is acted on by shunt magnets connected between each phase or side of the system and earth. The form of the instrument is such that the torque due to the magnets being out of phase is negligible. The disc has a gap opposite, but unsymmetrical to each magnet pole. Each magnet exerts its own torque on the disc independently, so that excess voltage between phases or between any one phase and earth will have effect. Four claims, two figures.

15,251/09. **Sparking Plugs.** F. B. LODGE and A. M. LODGE. Sparking plugs with both poles insulated for use in series with ordinary plugs to obtain more than one point of simultaneous ignition in each cylinder. Two claims, four figures.

16,811/09. **Rotors of Induction Motors.** SIEMENS BROTHERS DYNAMO WORKS, LTD., and E. O. KIEFFER. The bars and end rings are cast in a piece in place in the core by a special alloy. The end rings may have fan blades cast upon them to improve ventilation. Insulation between the conductors and the core can be obtained by asbestos linings to the slots or by dipping the core before casting into a mixture of clay and water. Special distance-pieces can be employed to prevent the metal running out when there are axial ventilating ducts. Seven claims, five figures.

22,302/09. **Combined Arc and Incandescent Lamp Circuits.** A. HEIMANN and W. SHÄFFER. The incandescent lamps form the series resistances of the arc lamps, but are protected from current variations by suitably proportioned "variators," or iron wire resistances with positive temperature coefficient. An independent resistance is used to take the rush of current on starting the arc lamps. Two claims, four figures.

26,251/09. **Electric Furnaces.** J. HÄRDÉN. These furnaces are particularly adapted for heating large quantities of material. The charge is heated, not only in the ordinary way by arcs from suspended carbon electrodes, but also by terminal plates of ohmic resistance in the furnace walls. Three claims, three figures.

28,475/09. **Driving Axles of Electric Cars.** D. BALACHOWSKY and P. CAIRE. This is an arrangement of gearless motor drive in which the outer member of the motor, which is usually the stator, is free to revolve, and is connected to a sleeve on which are mounted the driving wheels. The inner member, usually the rotor, is fixed to a central spindle, prevented from revolving through more than a small angle by springs, which give a certain elasticity to the drive. Ten claims, three figures.

1301/10. **Composite Conductors.** SIEMENS BROTHERS & Co. and W. DIESELHORST. A process of manufacturing conductors of high tensile strength by covering a central core of steel with a sheathing of copper in two or more turns, sweated together solidly and arranged so that each comes opposite to, and is protected by, an unseamed or continuous portion. One claim, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Names in italics indicate communicators of inventions from abroad.

Arc Lamps: RIDINGS, 13,842/09; SIEMENS BROS. & Co., HIRD and GRIMSTON [Projectors] 14,010/09; KÖRTING & MATHIESON A.-G., 26,706/09.

Dynamos, Motors & Transformers: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Rotary converters] 17,564/09; SIEMENS BROS. DYNAMO WORKS (*Siemens Schuckertwerke-Ges.*) [Regulation of frequency converters] 6,125/10.

Electrometallurgy and Electrochemistry: KELLER [Bleaching] 13,790/09.

Heating and Cooking: BELL and PLETTS [Air heater] 5,777/09; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [heating devices] 13,961/09; PREISS [Radiators] 14,040/09.

Incandescent Lamps: KRAUSE [Elastic supports for metal filaments] 22,458/09 and 350/10.

Switchgear, Fuses and Fittings: DONOVAN [Starting and regulating switches] 13,590/09; GEORGI and A. REYROLLE & Co. [Protective devices] 14,352/09; FASSLER [A.-C. current rectifiers] 14,980/09; THOMPSON [Pendant light fittings] 17,711/09; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Electrolytic condensers for lightning arresters, &c.] 21,480/09; DÉNÉRÉAZ [Plug and socket] 22,029/09; DENNY [Tumbler switches] 26,570/09; SIEMENS BROS. & Co. (*Siemens & Halske A.-G.*) [Damped relays] 1,428/10; JACKSON and SCHEIBE [Control gear for vapour rectifiers] 1,482/10.

Telephony and Telegraphy: VON LEPEL [Wireless apparatus] 28,452/09; FESSENDEN [Wireless system for airships] 29,481/09; BLOS [Automatic telephone exchanges] 29,801/09.

Traction: WHITING [Rail crossings] 2,014/09; BENTHAM and BARDSLEY [Brakes] 19,140/09; BURNET and TUDOR ACCUMULATOR Co. [Rail joints] 21,649/09; McKENZIE & HOLLAND, LTD., HAYWOOD and BEAUCHAMP [Signalling] 25,579/09; MITCHELL and DUDGEON [Overhead construction] 26,444/09; PIEPER [Propulsion and control of vehicles] 28,082/09; WILLIAMS and TORTORICE [Rail joints] 2,377/10.

Miscellaneous: WILSON [Spark coils] 13,509/09; COOPER [Packing boxes for metal filament lamps] 16,146/09; HUGUENIN [Magnetic belts and pulleys] 19,527/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: ALLGEMEINE ELEKTRICITÄTS-GES., 14,125/10.

Telephony, &c.: NEUHOLD [Automatic telephone exchanges] 8,228/10.

Traction: SIEMENS & HALSKE A.-G. [Signalling] 10,087/10.

Miscellaneous: DU BELLE [Electrically-operated mechanism for typewriters] 13,910/10.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., Schenectady*) [Insulation] 5,370/05.

Dynamos, &c.: H. R. STUART [Transformers] 5,071/04.

Electric Ignition: A. HERZ [Magnetos] 6,316/03.

Instruments, &c.: W. B. DUDDELL and T. MATHER [Resistances] 5,171/01.

Switchgear, &c.: C. PORTILLO [Connectors for branch circuits] 13,759/02; E. F. MOY & P. BASTIE [Switches] 5,232/05.

Telephony, &c.: E. BENNETT [Erection of overhead wires] 6,488/02.

Traction, &c.: E. FREUND [Tramcar brakes] 5,350/05; BRITISH THOMSON-HOUSTON Co. [Aerial ropeways] 5,584/05.

Miscellaneous: A. B. BROWN [Electric steering gear] 4,826/00; D. PERRET [Electromagnets] 25,218/04; H. R. ARTHUR [Electric signal for starting races] 5,486/05; A. HEIN [Electrically-driven vacuum cleaners] 26,355/05.

THE "TELEWRITER" EXCHANGE

BY means of the "telewriter" exchange, formally opened by the Lord Mayor on Friday, subscribers are enabled to send written messages and sketches to one another in the same way as subscribers to a telephone exchange are able to converse.

The "telewriter" is the name given to the latest improved pattern of Ritchie's "telautograph." This instrument, which has been on the market for some years, is an ingenious application of the principle of the d'Arsonval galvanometer or syphon recorder. The pencil of the

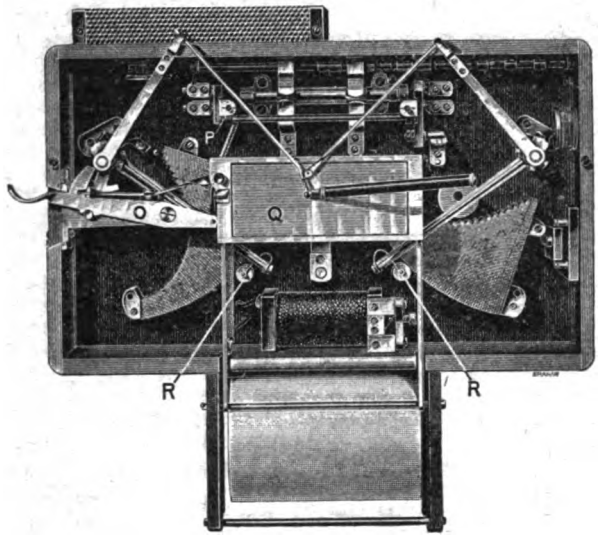

FIG. 1.—INTERIOR VIEW OF TRANSMITTER.

transmitter (Fig. 1) is at the end of two levers, which, as the pencil is moved, cause a roller contact *R* to travel over two quadrant-shaped rheostats. These rheostats are connected through a battery between each of the two lines and earth, and at the far end of the line a pen is geared in a similar manner to the spindles of the two coils connected between the lines and earth, and free to rotate in a magnetic field on the d'Arsonval galvanometer principle. (See Fig. 2.)

It is necessary to provide a device which prevents the pen at the receiving end from touching the paper when the pencil at the transmitting end is being moved without touching the surface of the paper. This is effected by an intermittent current sent by an induction coil, and superposed on the main line currents when the pencil presses on the paper platen on which the sending subscriber writes. This current passes through a differentially-wound coil at the receiving end, which operates a vibrating reed, opening and closing a contact shunting a coil which causes the pen to press against the paper. Normally the pen is held away from the paper by a spring, but when the reed vibrates the shunt to the coil is rapidly intermittent, and the coil is energised by a local circuit, which also serves to excite the electro-magnets between which the moving coils rotate. The slight vibration caused by the shunt being intermittent instead of being removed altogether has the advantage of easing the passage of the pen over any roughness that there may be in the paper. The receiving pen, when not in use, is held in an ink-well by the rod *I*.

The paper exposed on the plates *Q*, both at the sending and receiving end, is sufficient for writing about three lines. It is fed on to the platen from a roll by means of a ratchet worked by the subscriber at the sending end. Each movement of the ratchet-lever *Q* opens and closes a circuit which sends a current through the line and works a relay operating a paper shifter at the receiving end. The paper-shifting device at the transmitting end is marked *P* in Fig. 1.

The above describes generally the principle upon which the machine works. Needless to say, there are a number of details not mentioned here; the apparatus is a marvel of ingenuity, and represents most excellent workmanship. The parts of the instrument are manufactured by the British L. M. Ericsson Co., Ltd., and are assembled at the National Telewriter Co.'s works.

In the instruments connected to the exchange, resistances are inserted in each circuit so that the total resistance of each line is 500 ohms. It is essential that this should be the same on every subscriber's circuit, as the action of the instrument depends on variations of the transmitted current by adding and subtracting resistance as the pencil-levers move.

A telephone is hung on each instrument and is in circuit in place of the telewriter when removed from the switch-hook. The exchange switchboard is a small standard multiple board with hand-restoring indicators, equipped for 300 subscribers, the ultimate capacity of the multiple being 1,000. The calling subscriber asks for the wanted subscriber through the telephone in the ordinary way, and the operating is as for an ordinary telephone connection. A lamp is provided opposite each pair of cords, however, which glows when either subscriber is writing, and warns the operator not to cut into the circuit. This is essential, as not only would she receive the intermittent current of the pen-lifting circuit in her receiver, but the shunting of her instrument across the line would alter the value of the line currents and interfere with the writing.

There is a local battery of 18 secondary cells at each subscriber's instrument for operating the instrument and the various electro-magnets in the local circuit. These are kept constantly charged by a secondary battery of 3 cells in the exchange which is permanently on every subscriber's line when the line is not

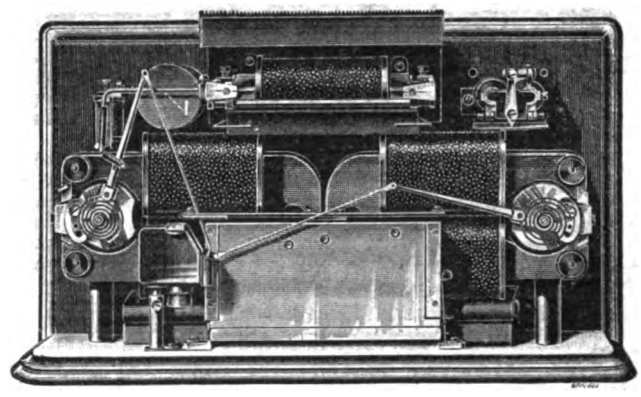

FIG. 2.—INTERIOR VIEW OF RECEIVER.

in use. When two subscribers are connected, their two batteries are in opposition, and the one who switches over to send a written message reverses his battery. Everything depends on the actual value of the current, as has already been explained, and it is therefore necessary that the voltage on the line terminals is maintained constant. The E.M.F. of the battery varies, of course, with the state of charge, and a delicate voltage regulator is included in the battery circuit. This is also employed on private telewriter lines which utilise the local electric lighting circuit for charging their batteries. On internal private lines the battery is dispensed with, and the electric lighting circuit is employed.

The exchange is at the offices of the National Telewriter Co., Ltd., at 20 Bucklersbury, London, E.C., and just over fifty subscribers are connected at present. Three lines go to the Central Telegraph office at St. Martin-le-Grand, and arrangements have been made

Digitized by Google

with the Post Office enabling subscribers to send telegrams to the office for transmission, and also, if they desire it, to have their own telegrams sent them on their telewriter.

There can be no doubt that the telewriter has a wide range of application, as not only written messages, but also sketches and diagrams can be transmitted, for although there is a certain amount of distortion of the writing or diagram if the adjustment of the instrument is not perfect, this is not serious. For engineering firms, the possibility of transmitting a sketch over a telephone wire to a correspondent is of considerable advantage, and the gain would be greater still if it were possible to use the telephone at the same time as making the sketch. We would suggest, therefore, that, if the exchange system develops to larger proportions, it would be advantageous to give subscribers the option of having a separate line for the telephone, so that the two instruments can be used simultaneously.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

MOTOR-STARTERS.—Particulars are given in a leaflet from George Ellison (17 Warstone Lane, Birmingham) of a series of totally enclosed starters for slip-ring and squirrel-cage induction motors with no voltage and overload releases. These starters comply with the Home Office rules and recommendations, and the nature of the enclosing cases renders them particularly suitable for mills and factories.

BALL BEARINGS.—We have received from Messrs. Harris & Samuels (10 Dean Street, Oxford Street, W.) a very complete list of ball, journal, thrust, and cone bearings for all purposes manufactured by the Maschinenfabrik "Rheinland" A.-G. (Düsseldorf). This is accompanied by a pamphlet on the theory of the ball bearing, written by one of the managing directors of the firm, which should prove of great interest to those designing machinery to which ball bearings may be applied.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

MOTOR SWITCHGEAR.—A leaflet from Messrs. Siemens Brothers' Dynamo Works, Ltd. (Caxton House, Westminster), describes a series of cast-iron weather-proof switch-boxes and motor-control pillars. The double- or triple-pole switch is contained in the same case as a set of "Zed" cartridge fuses, the latter behind a separate hinged window. A water-tight ammeter can be mounted on the top of the case, and the whole can be arranged together with an enclosed starter upon a wall frame or pillar.

MOVING COIL WATTMETERS.—Messrs. Siemens Brothers & Co., Ltd., have issued a list in which is described a new and more compact form of their "Precision" wattmeter, of the deflectional dynamometer pattern. These are now similar in external appearance to the firm's well-known continuous-current test-room instruments, and are made for a great variety of ranges both with pivotted and suspended coils. They are equally applicable to continuous and alternating currents, and a special series of transformers is provided for use with the latter.

METAL FILAMENT LAMPS.—The Foster Arc Lamp and Engineering Co., Warple Road, Wimbledon, are issuing a new folder calling attention to their metal filament lamps and auto-transformers. These can be printed with any dealer's name and address, and are intended for distribution over the counter or for inclosure in correspondence.

FANS AND SMALL MOTORS.—A new supplementary leaflet from Simplex Conduits, Ltd., deals with fans and small motors both for continuous and for alternating currents. The motors range down to $\frac{1}{6}$ h.-p., and are suitable for sewing machines, polishing, &c.

Birmingham Tramways Dispute.—In the Chancery Division, last week, before Mr. Justice Swinfen Eady, an action was brought by W. Neale and Mark Lyons, shareholders in the City of Birmingham Tramways Co., Ltd., to restrain the company from paying back to them out of the accumulated profits of the business £4 per £5 share in respect of certain fully paid ordinary shares of the company, by way of reduction of capital. At the recent annual meeting it was decided to pay back £4 per share on 6,047 ordinary shares, in order to bring all the ordinary shareholders upon the same level. It was contended that the directors had no powers to repay this sum. His Lordship, in giving judgment, held that there was legal power to return the amount in question, and so leave all the ordinary shares at £1 paid up, and upon which, of course, dividends would only be paid.

A SELF-STARTING INDUCTION MOTOR

THE Electric Construction Co., Ltd., has been experimenting for some time past with a new type of three-phase motor, the principal points of which are the absence of brushes, slip rings, rotor cables, or outside starter, and which has all the well-known good characteristics of the wound rotor type without its drawbacks. The peculiar features of this new machine (which has been designed and patented by N. Pensabene-Perez) are the method of fixing the resistances to the rotor, and the arrangement for cutting them out while the machine goes up in speed at starting. When the machine works at full speed there are no rubbing contacts whatever, so no lifting or short-circuiting plugs or similar complicated arrangements are necessary. The revolving resistances are very compact and of very strong mechanical construction, are totally enclosed in a cast-iron case, and they are cut out, either by hand or automatically. A very important feature of the machine is that, being started through a large number of steps (from 20 to 30 per phase), there is no jumping of the current at starting, but it gradually varies by small steps from the starting to the running value. The automatic type, considering the simplicity of its construction, is an important step forward in the development of induction motors. A long-distance control, as found necessary in the many applications of electrical drive, is thus accomplished at very little expense, and with the most reliable means by the simple operation of closing the stator main switch. The automatic type, being controlled by the speed, lends itself to a simple solution of the problem of preventing a rush of current during the starting period. In fact, by a rational choice of spring-tension, frictional resistance, and value of centrifugal forces, it is possible to keep the current approximately constant while the machine is speeding up, thus accomplishing what many complicated devices, in the case of hand control, are supposed to do. This motor is less expensive than the ordinary slip-ring type, and no starter or rotor cables are necessary.

A WIRING HANDBOOK

EVERYONE of our readers who has anything to do with electric wiring, should not fail to obtain from Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), a copy of the new edition of their handbook, "Conduit Wiring." Although it is only in pocket-book size, it is undoubtedly the most complete exposition of the subject in any publication of its kind. Particulars are given of the various methods of wiring in conduit, which are well illustrated with drawings and diagrams. At the beginning of the book are some useful tables of the gauges of conduits and wires, and the wiring capacity of conduits, and the book also includes descriptions of fittings and accessories, detailed instructions for fixing and wiring, notes on "Some Causes of Breakdown," and other useful notes and memoranda. Among the alternatives to conduit wiring described is a lead-covered system, which appears to have some excellent features, especially as a substitute for flexible systems of surface wiring. No price is marked on the book, and we believe that the firm will be pleased to present copies of it to any of our readers.

Electric Lighting at the Army Pageant.—During the evening performances the grounds of Fulham Palace were lighted by arc lamps, metal-filament lamps, and searchlights, as follows:—The arc lamps consisted of twenty British Westinghouse "Arcturus" flame arcs, 10-ampere size, burning four in series on a 200-volt, 50-period, A.-C. circuit. Six of these were fixed at the back of the Grand Stand, suspended from the roof in such a manner as to illuminate the grounds at the back of the stand, as well as the stand itself. Fourteen of these lamps were carried on wooden poles between the Grand Stand and the entrance, lighting the grounds generally. Metal-filament lamps were used for lighting the Grand Stand, and two 40-ampere searchlights were used for the purpose of illuminating the performances. The "Arcturus" lamps and the searchlights were supplied by the British Westinghouse Co., through their Supply Department, 3 West Street, Charing Cross Road, W.C.

The Junior Institution of Engineers.—Sir J. J. Thomson, F.R.S., Cavendish Professor of Experimental Physics of the University of Cambridge, has been elected President of the Junior Institution of Engineers, in succession to Sir Henry J. Oram, K.C.B., Engineer-in-Chief of the Fleet. The summer meeting in Ireland will commence on Saturday, 16th July, with a reception at Trinity College, Dublin, by the Provost and Professors of Engineering, followed by a visit to the Ringsend Power House of the Dublin United Tramway Company. In the evening there will be a reception by the Institution of Civil Engineers of Ireland, and on Monday the visits will include the Dublin Corporation Electricity Works. At Belfast, on Friday, Messrs. Harland and Wolff's shipbuilding and engineering works will be inspected; the Institution summer dinner will be held in the evening at the Grand Central Hotel, the President, Sir Henry J. Oram, K.C.B., in the chair. Various other visits and excursions have been arranged for.

ELECTRICAL EXHIBITS AT THE JAPAN-BRITISH EXHIBITION

THROUGH the courtesy of the Chairman of the Mechanical Engineering, Electricity, and Textile Machinery sections of the Japan-British Exhibition, a party of press representatives were on Monday last given a special demonstration of the objects of interest in these sections of the Exhibition. Electrical engineering cannot be said to be well represented in the British Section of the Exhibition, but there are a few exhibits to which attention may be called.

One of the most interesting features of the Machinery Hall is the collection of textile machinery in operation, following out the whole process of cotton spinning, and it is not too much to say that their combined display of the leading British manufacturers of textile machines is one of the finest exhibition demonstrations of this class of work that has been given. Naturally, the whole is electrically driven, and this is not the least interesting feature. The first stand that the visitor arrives at is that of Messrs. PLATT BROTHERS & Co., LTD. (Oldham). On one side of the passage-way are shown a series of openers, gins, bale-breakers, scutchers, lap machines, &c., while the later processes through which the cotton passes are exemplified on the other side by a series of machines, including a carding machine, a sliver lap machine, a comber, a drawing frame, a slubber, an intermediate frame, and a rover; examples of warp, weft, and doubling ring frames, a mule, and two looms. This part of the exhibit forms an example of group-drive through ropes and shafting, and is driven by a 40 b.h.p. three-phase motor by Messrs. J. & P. Hall, Ltd. (Oldham). A little further on a series of gassing frames, doublers, winders, and other textile machines shown by Messrs. JOSEPH STUBBS, LTD. (Manchester), exemplifies individual drive by small continuous-current 250-volt motors affixed to each machine. Electrically driven textile machinery of a heavier class, including a carpet loom, is represented on the stand of Messrs. R. WALL & Co. (Bury).

Perhaps the most imposing display, however, is that of Messrs. DOBSON & BARLOW, Oldham, where practically every class of cotton preparing and spinning machinery is to be seen at work. This whole exhibit is arranged for individual drive, and a good idea of its extent is obtained from the statement that it includes no less than twenty-seven motors, aggregating some 130 b.h.p. These, together with their starting-gear, &c., were all supplied by the British Westinghouse Co. The larger motors run on the 500-volt continuous-current exhibition power circuit, and the smaller motors from a 250-volt circuit supplied by a motor-generator on another stand.

Messrs. GREENWOOD & BATLEY (Leeds) have a stand in the textile section, on which they show some electrically driven silk machinery and a complete de Laval 6½-kw. turbo-generator of very compact proportions.

Turning now to the purely electrical exhibits, we are first struck by the fine stand of the GENERAL ELECTRIC Co., devoted almost entirely to Osram Lamps. A description and illustration of this stand was given in ELECTRICAL ENGINEERING, June 2nd, p. 363. The larger candle-power Osram lamps, up to 1,000 c.p., for street lighting, are particularly interesting, and no one can pass the stand without admiring the skill of the glass-blower who demonstrates the making of special shaped bulbs.

Another most effective stand is that of the INDIA RUBBER, GUTTA PERCHA, AND TELEGRAPH WORKS Co., LTD. (Silvertown), which at first sight appears to have a magnificent marble floor. A closer inspection, however, reveals that the flooring is the "mosaic india-rubber tiling," which the company are now making a speciality of. The surface is an excellent imitation of marble mosaic, and the material is both watertight and insulating, being specially suitable for generating station and switchboard gallery floors. The rubber is so treated as to be unaffected by oil, and we were told that even ink can be dropped upon it without making a permanent stain. A show case of cable samples, various ebonite goods, and a display of telegraph instruments, are to be found among the exhibits on the stand, which, by a happy coincidence, is opposite the fine loan collection of historic and modern telegraph apparatus of the Post Office, much of which also comes from Silvertown.

Storage batteries of all kinds are shown by the CHLORIDE ELECTRICAL STORAGE Co. (Pendlebury, Manchester). These range from the smallest "Exide" ignition cells to a 72-plate 6,120-ampere hour cell, similar to those composing the new stand by excitation and auxiliary battery at the Lot's Road Station of the Underground Railway Co. A 2,100-ampere hour cell as supplied to Shanghai, is also shown. Opportunity is given to study the construction of the well-known Chloride and Exide plates, and at the back of the stand is a marble switchboard containing the complete switchgear, including the variable carbon rheostat, which is used in the "Entz" reversible battery booster system, with which the company has had so much success.

Near this stand is a fine display of telephones and telephone apparatus by the WESTERN ELECTRIC COMPANY (North Woolwich), which may be said to speak for itself.

Mention has already been made of the motor-generator set which supplies the 250-volt power circuit in the Machinery Hall, and this is to be seen running on the stand of Messrs. ELECTRO-MOTORS, LTD. (Openshaw, Manchester), together with representative examples of their well-known continuous-current machinery arranged as motors, dynamos, balancers, &c. Small steam- and petrol-driven generating sets, electrically driven fans, and an automatic switch system for controlling pump motors are also shown.

Considerable interest attaches to the stand of Messrs. NEWTONS, LTD. (Taunton), who have specialised in continuous-current machinery upon the Zone system designed by Mr. J. W. Burleigh, in which, by a special arrangement of the main and auxiliary pole systems an extremely light field system is obtained with very slight magnetic leakage, excellent ventilation, and favourable conditions of commutation are secured enabling large overloads to be negotiated. The 140-kw. multipolar machine shown has a number of interesting points in its design, as well as the smaller machines shown embodying the same principle. It may be mentioned that the London agents for these machines are Messrs. Baxter and Gaunter, 86 Charing Cross Road, W.C.

The MAXIM LAMP WORKS, LTD. (Shernhall Street, Walthamstow), show flame and enclosed arc lamps of various patterns, including the special enclosed lamp, of which some 400 are in use throughout the Exhibition, and a twin arc lamp for continuous current to burn singly or 200/250-volt circuits. Several transformers are shown, and a good deal of interest attaches to the examples of the Maxim London-made metal filament lamp, particularly as regards the high-voltage lamps, with bulbs no larger than the ordinary carbon lamp, and including some very effective fancy bulbs. The compactness of these lamps is mainly due to the way in which the constituent sections of the filament are arranged with the plane of each radial, instead of circumferential to the axis of the bulb.

Several new designs of flexible and extending fittings are shown by J. DUGDILL & Co. (Failsworth, Manchester), including some in which the movement up and down of the fitting itself works an automatic double-pole switch within the fitting, and turns the light on and off. Several special hospital and works fittings are shown.

Attention should also be drawn to the primary battery hand lamps of the FLOAT ELECTRIC Co., LTD. (Adam Street, New Kent Road). These include miners' and other lamps, the chief feature of which is that when placed upside down, the electrolyte is not in contact with the electrodes, so that local action is absolutely prevented. An advantage claimed for the miner's lamp over accumulator lamps is that in the event of damage to a lamp by a fall, even a short circuit in the leads cannot produce a dangerous heating, as the cell is of such internal resistance as to prevent even a momentary output of more than about two watts. It is interesting to note that Captain Scott's Antarctic expedition is provided with an equipment of this lamp, with sufficient recharging materials to last two years, divided into three lots, one for the base, one for the intermediate depôt, and the third for Captain Scott's final dash to the Pole itself. The firm also show a dry battery with a gelatinous electrolyte from which the zinc rod can be entirely removed when not in use, and the cell kept for long periods without deterioration.

The DOWSING RADIANT HEAT Co., LTD. (24 Budge Row, E.C.), exhibit some new patterns of their electric "sun" baths, electrically actuated vibrators for massage and hair dryers, as well as their well-known patent lamp radiators. They have also a novelty in a very cheap form of electric hot-plate covered with a special non-metallic material.

Messrs. T. and J. JACKSON (14 Park Road, N.W.) show a combined electric light and pumping equipment for country houses, driven by a single-cylinder paraffin engine, with a particularly simple rotary combined inlet and exhaust valve. They also show several electrical specialities, including water heaters, an automatic battery cut-out, and a special controlling switch for regulating the voltage from a battery in a country-house installation by switching an additional cell in or out in either direction.

In conclusion, we should express our appreciation of the trouble taken by Mr. F. B. Converse, Electrical Engineer to the Japan-British Exhibition, in conducting our representative round the stands.

Municipal Wiring at Leicester.—In connection with the recent decision of Mr. Justice Neville that the Leicester Corporation have been illegally carrying on an electric wiring and fittings department, the Corporation, before giving notice of appeal, are communicating with other Corporations similarly placed. The Corporation have three weeks from June 20th in which to give notice of their intention to appeal against the decision of the Chancery judge, *i.e.*, until July 11th.

The National Telephone Transfer.—In answer to Mr. Devlin in the House of Commons on Tuesday, the Postmaster-General said that arrangements are being made with the National Telephone Co. to ensure the transfer of the system to the Post Office on or as soon as possible after the date of purchase. The preparation of an inventory of the company's plant has been discussed with the company, and it is hoped that it will shortly be put in hand, and that it will be found possible for the Post Office check on this inventory to proceed concurrently.

"FREE WIRING" AT CANTERBURY

JUDGMENT has been given in the Canterbury County Court in an action against the Canterbury Corporation concerning "free" wiring. Some years ago the National Electric Construction Co., Ltd. (then the National Free Wiring Co., Ltd.) entered into an agreement for the "free wiring" of premises, the Corporation to pay them 1d. per unit upon all energy consumed in the premises so wired.

The action in question was for the payment of £25 13s. 9d. in respect of particular premises, the present occupier of which is not the person who agreed to the installation to be put in, and who, moreover, refuses to pay an extra 1d. per unit to the Corporation. The Corporation argued that, as they had no powers to supply fittings and to wire premises, they equally had no power to employ contractors for this purpose and to pay them. The agreement between the Corporation and the company, it was said, only applied to consumers agreeing to pay an extra 1d. per unit, which was collected by the Corporation on behalf of the company, and handed over to them. The moment this particular consumer left the premises and a new one came in who refused to enter into an agreement to pay an extra 1d. per unit, then, it was argued, they were under no liability to pay that amount over to the company. No provision was made in the agreement in the event of the original consumer leaving the premises.

Deputy Judge Haigh, who heard the action, has now given judgment in favour of the Corporation, and upholds the contention that if the Corporation were not, as obviously they were not, empowered to undertake the wiring and fitting of premises themselves, they were equally not empowered to pay the company for doing such work.

This judgment is interesting in connection with the case of the Attorney-General *v.* the Leicester Corporation (see ELECTRICAL ENGINEERING, June 16th and 23rd, pp. 397 and 409), in which it was laid down by Mr. Justice Neville that a Corporation has no right to wire consumers' premises unless it has powers to do so under a Special Act. Unless the present judgment, and that of Mr. Justice Neville, are reversed on appeal, it follows that a Corporation working under an ordinary Provisional Order is not entitled either to wire consumers' premises itself or to have them wired through a wiring contractor, whether on a "free-wiring," hire-purchase, or sale outright agreement.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

AMONG the works visited by the members of the International Mining Congress at Dusseldorf (an account of which is given in our supplement on ELECTRICAL ENGINEERING IN MINES) was the Lindenberg Steel Works, Remsheid-Hasten. These works were established in 1864, and have similar establishments at Berlin and New York, and the share capital being only £150,000 they are typical as representing the prevailing conditions in such undertakings throughout the country. The Remscheid works are used for the manufacture of high-grade tool steel and high-speed cutting steel, for motor cars and other special requirements. All the steel is rolled and forged in the works, the annual output of crude ingots of such high grade electro-steel being about 5,000 lbs. There are installed a steel plant, a Wellman open-hearth furnace, and two Heroult electric smelting furnaces, the latter of which have a capacity of 1½ and 3 tons respectively, and are used for refining the high-grade steel during the latter stages of manufacture only, by the acid and basic processes. These electric furnaces receive their charges from the open-hearth furnace, where the steel has been refined to a certain grade. They are of the Heroult type, with carbon electrodes entering the furnace from the top, and automatically adjusted by electric motors, so that the arcs may be kept uniform whilst current is supplied at 50 volts. The electric furnaces at these works are the first of their kind to have been installed in Europe, and although none have yet been used in this country, we understand that their installation is now being considered here, as they are essential for the refining of high-grade steels in the latter stages of manufacture, although rather costly in operation for the carrying through of the complete refining process. The power house generates 2,600 h.p., and a further 800 h.p. are produced at the works, which also supply electrical energy for operating plate mills, forge section rolling mills, and machines at the magnet works. Only 300 men are employed, as the entire works are well provided with up-to-date labour-saving appliances and conveniences for the workman's comfort, whilst the wages earned are less than prevails in this country.

LOCAL NOTES

ACTON: *Agreement with Supply Co.*—The Council decided at a special meeting on Thursday to give the necessary notice for terminating the agreement with the Metropolitan Electric Supply Co., for the supply of electricity in bulk. The agreement expires in December, 1913.

ARGENTINA: *Buenos Aires Tramways.*—The extension of the Buenos Aires tramways to the Avellaneda district will shortly be opened. This extension amounts to some thirteen miles.

BATH: *Electricity Deficit.*—When the accounts of the Electricity Department were first made up the deficiency was put at £1,334. The figures have now been revised, and the actual deficit is shown as £580. The reduction in price is mainly due to matters of accountancy, but, in addition, it is now recommended that the amount of the reserve fund shall be applied towards reducing the deficit.

BIRMINGHAM: *Tramway Extension.*—The Birmingham Trades Council have passed resolutions strongly supporting the proposed tramway service to Harborne.

BRAY: *The Maximum Demand System.*—The Electrical Engineer recommends abandoning the maximum demand system of charging and adopting flat rates.

BURNLEY: *Electricity Accounts.*—The net profit on the electricity undertaking for the past year was £4,148, against £4,169 in the previous year. Of this £3,000 have been applied to relief of rates, and the remainder has been transferred to depreciation account. The number of units sold was 3,249,387, against 3,148,875 in the previous year.

CLECKHEATON: *Electricity Accounts.*—There was a net loss on the electricity undertaking last year of £14.

HULL: *Tramway Accounts.*—The revenue from the tramways last year was £136,985, whilst the working expenses amounted to £96,098. After meeting capital charges, income tax and contribution towards street widenings, there is a net surplus of £22,942, of which £16,000 is transferred to relief of rates, and the balance to reserve fund.

ILFORD: *Electricity Accounts.*—The net profit for the past year upon the electricity undertaking was £1,562, compared with a deficit of £300 in the previous year.

LEEDS: *Tramways to Otley.*—The Otley Council have again considered the proposal to extend the Leeds tramways to that district. The construction of tramways has been abandoned as too expensive, and estimates have now been prepared for an installation of trolley omnibuses. The overhead equipment is estimated to cost £10,000, and seven cars £5,600. The capital charges upon the total expenditure would be £1,812 per annum, which the Leeds Corporation would expect the Otley Council to guarantee. On these figures the Council feel that the expense would still be too great, as it is not thought likely that the requisite number of passengers would be carried to meet these charges.

LEEK: *Increased Electricity Charges.*—The Council have passed a recommendation of the Lighting Committee to increase the flat rate charge for electricity supply by ½d. per unit.

LEICESTER: *Management of Electricity Undertaking.*—At the meeting of the Council last week it was decided to separate the control of the electricity department from that of the gas department. The question of combining the two electricity works is to be reported upon by an outside engineer.

LLANDUDNO: *Street Electric Lighting.*—About two years ago the question of replacing the arc lamps on the promenade by gas was discussed at some length, and an experiment was embarked upon to show the relative advantages of gas and electricity in this connection. A Special Committee have now reported in favour of electricity, and the Council, acting upon their recommendation, have ordered the removal of the experimental gas lamps.

LONDON: *Hammersmith: Electric Lighting Accounts.*—The gross revenue for the past year, namely, £53,433, shows a decrease compared with the previous year. After meeting capital charges the net profit amounts to £5,483. The number of units sold was 7,054,926, compared with 6,198,339 in the previous year, and the total maximum supply demanded was 4,653 kw. This total includes the sale of current to the Imperial International Exhibition, but the units consumed there were less than during the previous exhibition.

Marylebone.—The General Manager has advised that in future the annual charge in respect of the use of electricity for all domestic purposes (other than lighting) should be discontinued,

Digitized by Google

as the annual charge for lighting is now considered sufficient to cover all uses of electricity. The proposed reduction will only apply to private consumers who adopt the "telephone" system of charging, and the Electricity Committee are satisfied that though there will be a trifling decrease in revenue the increased business that will be obtained will amply recoup the concession. It will appeal to people who use electricity for other purposes than lighting, and who object to the present small charge per piece of apparatus, and is, of course, another step towards simplification.

Street-Lighting.—The Lighting Committee report that a further forty-two lamps have been converted from gas to electricity, making a total of 2,262 lamps now lit by electricity.

LUTON: *Electricity Accounts.*—The accounts for the electricity department for the past year show a net profit of £3,066 after meeting capital charges. The sum of £908 has been transferred to relief of rates, and £658 to reserve fund, the balance standing to the credit of appropriation account now being £2,606 10s. The charges for electric supply have been revised, and represent approximately a reduction of 20 per cent. for power, 16 per cent. for lighting, and 50 per cent. for heating and cooking. In view of the satisfactory nature of the year's working, the Electricity Committee recommend that every employee in the Department should receive a bonus of one week's wages.

MANCHESTER: *Tramways Accounts.*—The Corporation tramway accounts show a profit of £149,068 after meeting capital charges. It is proposed to distribute this as follows:—Reserve, renewal and depreciation, £70,020 10s.; contribution to rates, £75,000; street improvements, £4,047.

NEWCASTLE-UPON-TYNE: *Tramways.*—The net income from the tramways last year was £197,612, which is only slightly worse than in the previous year. The balance on the year's working is £15,516, which is to be carried to reserve and renewals fund, making this £75,272.

NEWPORT: *Electricity Accounts.*—The net profit on the electricity undertaking for the past year was £376.

Tramway Accounts.—The net profit on the Corporation tramway undertaking for the past year amounts to £2,322.

OLDHAM: *Electricity Accounts.*—The net profit for the past year on the electricity undertaking was £2,203. Under the Oldham Corporation Act of 1909, the area of supply has been considerably increased, with the sanction of the various Local Authorities and the Lancashire Electric Power Co. Experiments have been carried out during the year with lighting Union Street by arc lamps.

SALFORD: *Charge for Tramway Energy.*—Sub-committees from the Electricity and Tramways Committees have concluded the following arrangements as to the charge for current used for traction purposes: (1) The Tramways Committee to guarantee a minimum annual consumption of seven million units of electrical energy, the price to be 1·30d., the present charge; (2) all current consumed by the Tramways Committee in excess of seven million units per annum to be charged for at the rate of 1d. per unit.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

AUSTRALIA.—Port Pirie (South Australia) Council have adopted a report in favour of electric lighting. A Consulting Engineer is to be appointed.

BLACKPOOL.—The scheme for the electric lighting of Bispham district, under the Bispham-with-Norbuck Electric Lighting Order, 1908, prepared by Mr. J. W. Speight, of St. Anne's-on-Sea, has been approved.

BRIDLINGTON. The Local Government Board have sanctioned the borrowing of £2,975 for electrical purposes.

CARLISLE.—An inquiry was held yesterday concerning a loan of £19,600 for electrical extensions.

DENMARK.—The British Consul at Copenhagen reports that large electrical works are at present being planned in Jutland in the district between Aarhus and Randers. The scheme includes an electric railway between these two places, and the establishment of electricity supply.

FLEETWOOD.—The Council require a low-tension switchboard and a 300-kw. steam dynamo. Particulars from the Borough Electrical Engineer, and tenders by July 15th.

IRELAND.—A scheme of electric lighting prepared by Messrs. Coates & Son, Ltd., of Belfast, has been approved, and a public meeting is to be called to consider the matter.

LONDON: *Hammersmith.*—The Highways Committee of the L.C.C. have sanctioned loans of £10,665 and £5,236 for electrical purposes.

Islington.—Sir Alexander Kennedy has reported upon the desirability of increasing the capacity of certain electrical mains. He is of opinion that the present high-tension feeders to four areas are seriously overloaded, and that certain extensions proposed by Mr. Gay, the Borough Electrical Engineer, are absolutely necessary to provide sufficient capacity to meet the probable increase in demand. Sir Alexander further advises the adoption of sub-stations for present and future extensions, in order to obtain satisfactory regulation of the supply pressure. The extensions are estimated to cost £19,872, and the Electricity Committee recommends that tenders be invited.

The Electrical Engineer has also reported that it is necessary, in order to comply with the Home Office electrical regulations, to provide a new main switchboard, at an estimated cost of £3,000.

St. Pancras.—The Chief Electrical Engineer has been instructed to prepare a scheme for a temporary boiler for the coming winter, and tenders are to be invited for same.

NORWAY.—A company has been formed in Norway for the purpose of utilising the water power of the Gullfoss and Sog Falls in Iceland. The name and address of a gentleman who might be communicated with in the matter is on file at the Board of Trade, 73 Basinghall Street, London.

RUSSIA.—H.M. Consul at Moscow reports a great demand in Saratoff for electrical apparatus of all sorts. British firms desirous of doing business there should communicate in German, quoting in marks or roubles.

WARRINGTON.—An Impulse Turbo-alternator of 1,000 kw., with condensing plant, a 750 kw. reversible rotary converter, and the necessary high- and low-tension switchgear, are to be installed at the Corporation's electricity works.

WEDNESBURY.—Mains are to be extended to the King's Hill district at an estimated cost of £327.

Miscellaneous

CARDIFF.—The Borough Electrical Engineer and Tramways Manager has been instructed to obtain tenders for 130 tramcar meters, and to report upon the advantages to be gained from their use.

GRIMSBY.—The Corporation require a supply of 50 c.p. metal filament lamps. (See an advertisement on another page.)

ITALY.—The Italian Minister of Posts and Telegraphs is promoting a Bill providing for an expenditure of £30,000 upon new telephone lines.

MANCHESTER.—The Tramways Committee invite tenders for hard drawn copper trolley wire. Particulars from the Manager, and tenders by July 19th.

SOUTHAMPTON.—The Corporation have decided to construct tramways to the Northern district.

SWANSEA.—The Harbour Trustees require three two-ton electric transporters and overhead travelling cranes. The Clerk, Harbour Board Office. Tenders by July 15th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

E.C.—Warehouses, City. J. F. May, 249½ High Holborn, W.C.

W.C.—West London Mission Institute, Kingsway. W.C. Architects, Gordon & Gunton, Finsbury House, Blomfield Street, E.C.

N.E.—Rebuilding pavilion at Hackney Infirmary, High Street, Homerton. Builders, C. Wall, Ltd., 4 Lloyd's Avenue, E.C.

S.E.—Offices, &c., Southwark Park Road. Architect, E. K. Purchase, 20 and 22 Maddox Street, W.

PROVINCES.

ACCRINGTON.—Works, Grange Lane (£4,700). Architects, Grimshaw & Cunliffe, Bank Buildings, Accrington.

ASHTON-UNDER-LYNE.—Bank for Ashton Savings Bank. Architects, Wm. H. George & Son, Ashton.

BARNET.—The Guardians have decided to invite tenders for installing electric light in the workhouse.

BIRMINGHAM.—Factory. Architect, T. Silver, Soho Hill, Birmingham. Builder, T. Gregory, Olton, Birmingham.

BISHOP AUCKLAND.—Remodelling of block of infirmary (£1,200). S. Adams, Clerk, Board of Guardians.

BOLTON.—Extension, workhouse (£1,500). Builders, J. C. & F. Woods, Bolton.

BRISTOL.—Extensions, Corn Exchange (£2,000). H. Faraday Proctor, City Electrical Engineer.

BURTON-ON-TRENT.—Theatre. Architect, T. Jenkins, Burton-on-Trent.

BURY.—Mortuary at Infirmary (£1,600). Architect, J. H. Nuttal, 20 Market Street, Bury.

CHESTER.—Fire Station. Builders, T. Meyes & Son, Chester.

DARLINGTON.—School (£4,000). G. Winter, Borough Surveyor, Town Hall, Darlington.

DEVONPORT.—School, Camel's Head. Architects, Thornley & Rooke, The Crescent, Plymouth.

Digitized by Google

DOVER.—Paper mills for Wiggins, Teape & Co.
DUBLIN.—New pavilion at Royal Hospital for Incurables. The Governors.
DUDLEY.—Theatre. Architects, Bishop & Smith, Wednesbury.
EAST HAM.—Cinematograph Theatre, 189 High Street North. J. W. Lohden.
EDINBURGH.—Tenders are invited by July 12th for the electric wiring of the workshops at the Tynecastle Supplementary School. Clerk, School Board Offices, Castle Terrace, Edinburgh.
GLASGOW.—Picture Palaces for the Scottish Electric Picture Palaces, Ltd. (£10,500). Architects, Neil & Duff, 155 Wellington Street, Glasgow.
HORNSEY.—Tenders are invited for the wiring of the Stroud Green School. Particulars from the Borough Electrical Engineer, and tenders by July 9th.
ILFORD.—Premier Electric Theatre, High Road. Architects, Emden, Egan & Co., 3 Lancaster Place, W.C.
NORTHAMPTON.—Theatre, Abington Street, for W. T. Simmons.
NOTTINGHAM.—Bank, High Street, for the National Provincial Bank of England, Ltd.
SWANSEA.—Bank (£8,000). Architects, Waller & Son, Gloucester.

TENDERS RECEIVED AND ACCEPTED

ACCRINGTON.—Two Brush double-deck cars at £740 each are to be purchased.
ECCLES.—The Council have accepted the following tenders in connection with the electricity undertaking:—Stewarts & Lloyds, Ltd. (Manchester), steel steam pipework, £14 12s.; H. J. & A. Coulthurst (Darwen), cast-iron condensing water pipework, £25 10s.
KINGSTON-ON-THAMES.—The Council have accepted the tender of Prestwich & Burt for extensions to the main high-tension switchboard, at £334 19s.
LEYTON.—The Council have accepted the tender of Fraser & Fraser, at £70 10s., for an ash elevator at the generating station.
LONDON: *London County Council.*—The tender of the Brush Electrical Engineering Co., Ltd., at £3 7s. each for 180 destination indicator-boxes has been accepted.
Southwark.—The Council have received the following tenders: Turbo-generator, Parsons, £4,265; Willans & Robinson, £3,604; Howden, £4,412; Westinghouse, £3,170; General Electric Co. (provisionally accepted), £3,130; Mitchell, £3,192; Bellis, £3,372; British Electric Plant Co., £3,950; Musgrave, £4,498; Brush, £3,375; B.T.-H. Co., £3,200; The Union Electric Co., Lancashire Dynamo Co., and E.C.C. tendered for the generators only.
The tender of the Davenport Engineering Co. at £1,327 has been provisionally accepted for the cooling tower, and that of the Worthington Pump Co. at £1,888 for the condensing plant.
Woolwich.—The Council have accepted the tender of Sanders, Rehders & Co., at £34 10s., for a "Sarco" recorder for the electricity works. They have also accepted the tender of Carter & Wright for a 15-in. centre lathe with accessories, for £135.
SALFORD.—The Council has accepted the tender of P. R. Jackson & Co., Ltd., at £39 15s., for the supply and delivery of one spare armature, complete with commutator and shaft.

MISCELLANEOUS CITY NOTES

NORTHAMPTON ELECTRIC LIGHT & POWER CO.—An issue of £50,000 debentures of £50 each is to be made at par.
DIVIDENDS ANNOUNCED.—National Telephone Co., 6 per cent. per annum on the deferred stock for the June half-year, placing £175,000 to reserve, and carrying £15,000 forward.
Mexico Tramways Co.: Quarterly dividend at the rate of 7 per cent. per annum.
RIVER PLATE ELECTRICITY CO.—Notice has been given of the conversion of 120,000 ordinary shares of £1 each into £120,000 of ordinary stock, and of 100,000 preference shares of £1 each into £100,000 six per cent. non-cumulative preference stock.
MORTGAGES AND CHARGES.—Railless Electric Traction Co.: Particulars of £3,000 debentures, created April 7th, and secured by trust deed dated June 14th, 1910, the amount of the present issue being nil. Property charged: certain inventions and patents and the company's undertaking and other property, present and future, including uncalled capital. Trustees: Sir Charles D. Fox and W. G. F. Nelson.—Anglo-Argentine Tramways Co.: Trust deed, dated June 15th, 1910, to secure £1,500,000 five per cent. debenture stock, with power to issue further debenture stock ranking *pari passu* therewith, not exceeding in all £6,000,000, and certain other moneys. Property charged: The company's undertaking and property, present and future, including uncalled capital, subject to indentures dated January 9th, 1905, June 2nd, 1908, and January 22nd, and July 1st, 1909. Trustees: Law Debenture Corporation, Ltd., 41 Threadneedle Street, E.C.

COMPANIES' MEETINGS AND REPORTS

ELEKTRICITATS GES. VORM. W. LAHMEYER & CO. (Frankfort-on-Main).—The net profit for the past year is 1,454,472 mks. (approx. £72,700), slightly less than the previous year. A dividend of 5 per cent. is recommended, as against 6 per cent. for the previous year. The capital of the company now amounts to 25 million marks (approx. £1,250,000).
GLOBE TELEGRAPH AND TRUST.—The report for the year ended May 31st, gives the net revenue as £209,118, making, with the balance brought forward, £236,432. The available balance, after payment of interim dividends, is £105,336, and a final dividend of 3s. on the preference shares, making 6 per cent. per annum, and 5s. 9d. per share on the ordinary shares, making 5¾ per cent., is recommended. £27,681 is carried forward.
J. G. WHITE & CO.—The net profit for the year was £64,802, the highest earned since the formation of the company. The company is engaged upon important work in Brazil, Argentina, and other places abroad. After meeting the dividend on the 6 per cent. cumulative preferred shares, a dividend of 10 per cent. is declared upon the ordinary shares. The sum of £32,975 is applied in reduction of "purchase of business" account, and £19,404 is carried forward. At the annual meeting it was pointed out that the profits for the past year were larger by more than 50 per cent. than in any previous year. The reserve fund amounts to £100,000, and the Company now has more business in hand than at any time for several years past. After paying dividends this year, the position of the Company is strengthened by nearly £40,000 in net available assets, and the assets are now more than twice the Company's total paid-up capital.
KALGOORLIE ELECTRIC TRAMWAYS.—The net profit for 1909 was £16,573, compared with £15,400 in the previous year.
RIO DE JANEIRO TRAMWAY, LIGHT & POWER CO.—The report for 1909 states that the net profit for the year amounted to 1,149,607 dol. Quarterly dividends of 1 per cent. are being paid. The company had contracts for the supply of 25,719 h.p. on December 31st, against 15,619 h.p. in the previous year. Some interference with the tramway traffic is still being experienced, but all the lines are being rapidly converted to electric traction. The number of additional telephone subscribers secured during the year was 572, making the total 3,991.
GREENWOOD & BATLEY.—The accounts for 1909 show a net sum available, including the amount brought forward, of £12,239. The sum of £3,000 is added to depreciation, and a dividend of 7 per cent. declared on the cumulative preference shares. A balance of £2,211 is carried forward.
CORDOBA LIGHT, POWER & TRACTION CO.—It has been decided to increase the capital of the company to £800,000 by the creation of 300,000 new £1 shares. The new capital is required to complete the works now in hand for all three branches of the company's business.
BOMBAY ELECTRIC SUPPLY & TRAMWAYS CO.—The accounts for 1909 show an increase in revenue of £19,972 compared with the previous year, whilst the expenditure increased by £4,343. After meeting the 6 per cent. preference dividend, £6,000 have been transferred to sinking fund for capital redemption, and £15,000 to depreciation, carrying forward £4,567. The Bombay Corporation have sanctioned certain alterations in the fares, which, in some cases, were unremunerative. The maximum demand system of charging for electrical energy is being abandoned, and a flat-rate tariff instituted, which experience has shown to be better adapted to Oriental conditions.
ELECTRIC TRACTION COMPANY OF HONG KONG.—The Board propose to raise an additional £30,000 of 5 per cent. mortgage debentures, and to write down the 325,000 £1 shares to 5s. each. The existing debenture-holders are opposed to this proposal, as they do not believe that the position of the Company warrants this course of action.
BRITISH ALUMINIUM CO.—The statutory meeting of the reconstructed British Aluminium Co. was held last week, when it was stated that the whole of the shares provided for under the re-arrangement were issued and allotted, and that an issue had also been made of £800,000 5 per cent. prior lien debentures. The total capital of the new Company is £2,420,581, made up of the 5 per cent. debentures mentioned above; £720,398 debenture stock; and £299,570 non-cumulative £1 preference shares and £600,613 ordinary shares. The Company has now sufficient funds to complete the Loch Leven works and their other works. Mr. A. W. Tate, who presided, said that if the present demands for aluminium continue, they should be able to get rid of the whole of the output from the various works, at a price which would yield a reasonable profit.
MARCONI INTERNATIONAL MARINE COMMUNICATION CO.—The report for 1909 states that the business has now reached the stage when the revenue exceeds the heavy standing expenditure, and the directors are confident that the business will continue to show considerable extension.
VICTORIA FALLS & TRANSVAAL POWER CO.—The report for 1909 states that the year has again been mainly occupied in construction work, and, therefore, a profit and loss account has not been prepared. A revenue and expenditure

Digitized by Google

account, however, is incorporated in the balance sheet, and shows a surplus of £50,534, which, with the surplus brought forward from the two previous years, makes the total of £135,397, which is carried forward. In consequence of the increasing demand, the directors deem it wise to carry forward this sum instead of distributing dividends upon the preference shares. It is hoped to pay such dividends after May next, when the new station at Rosherville will be in operation. The demands of the various mines have been in excess of the output of the new stations at Brakpan and Simmer Pan. The capacity of the latter station has now been increased to 27,400 h.-p., and the former to 9,700 h.-p. The estimates of the consulting engineers with regard to coal consumption and cost of production at Brakpan and Simmer Pan have been justified. Extensions are being made to the overhead supply in the various mines. The total capacity of the various power stations when completed will be 155,100 h.-p., in addition to 16,000 h.-p. steam turbine-driven air compressors. This plant will enable the Company to supply 500,000,000 units per annum, with sufficient reserve plant. Mr. Bernard Price has been appointed the Company's Engineer-in-Chief in South Africa.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £57 5s. to £57 15s. per ton (last week, £57 5s. to £57 15s.).

HENLEY'S NEW TELEGRAPHIC ADDRESS.—The telegraphic address of Messrs. W. T. Henley's Telegraph Works Co. Ltd., is "Henletel," London. This word is also registered for use in connection with the firm's branches at Glasgow, Newcastle, Manchester, and Birmingham.

DISSOLUTION OF PARTNERSHIP.—B. Shaw and E. H. Pickford, mechanical and electrical engineers, 264 and 266 Eccleshall Road, Sheffield, have dissolved partnership. Debts, &c., by E. H. Pickford.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—Mr. H. Wilson, 23 Devereux Court, Strand, London, has been appointed trustee in the bankruptcy of J. P. L. Donlevy, consulting electrician, 123 Tulse Hill, Surrey.

In the Liverpool County Court last week an application was made for the discharge from bankruptcy of Mr. A. H. Gibbings, Electrical Engineer, of Liverpool. On behalf of the debtor, it was stated that, but for the action of the House of Lords in inserting the clause in the Electric Lighting Act of 1909, prohibiting supply by non-statutory undertakings, the North British Electrical Power Syndicate would have been formed, from which Mr. Gibbings would have received £15,000 in fees alone, and a large income, as years went on. Most of his debts had been incurred in conducting negotiations and securing wayleaves for that scheme. The discharge was granted, subject to a few minor conditions.

In the Chancery Division last week, before Mr. Justice Swinfen Eady, an application on behalf of the first debenture-holders of the Sunderland District Tramways for the appointment of a receiver and manager was granted. There is already a receiver and manager for the second debenture-holders.

OSRAM LAMPS AT A SKATING CARNIVAL.—At a fancy dress carnival held at the Long Eaton Skating Rink on June 14th, Mr. Albert Burns, a local electrician, obtained the first prize for his representation of "Electricity," in which Osram lamps, supplied from two small batteries, played a prominent part.

APPOINTMENTS AND PERSONAL NOTES

Foreman wanted for electrical repair shop. Well up in A.C. and D.C. work. (See an advertisement on another page.)

The salary of Mr. L. Johnston, Borough Electrical Engineer at Gloucester, is to be increased to £350 per annum.

Mr. F. T. Olding, Traffic Superintendent of the Bournemouth Corporation Tramways, has been presented with a pair of prismatic binoculars on the occasion of his leaving to take up an important appointment in Queensland.

Mr. John Wood, Junior, has been admitted a partner in the firm of Messrs. Mosses & Mitchell, of Golden Lane, London.

The appointment of Mr. C. H. Yeaman, Borough Electrical Engineer at Hanley, as Chief Electrical Engineer to the new County Borough of Stoke-upon-Trent, at a salary of £500 per annum and £10 per annum for local travelling expenses, has been confirmed by the Council. Mr. Yeaman was presented last week with a silver fountain pen by the students to whom he has delivered a course of lectures on electricity supply at the Municipal School.

Mr. W. Fennell, Electrical Engineer to the Wednesbury District Council, has entered into a new agreement at a salary of £275 per annum for two years, and £300 for the third year.

Mr. C. J. Habgood, of Bristol, has been appointed Shift Engineer at Wednesbury in place of G. Garratt.

Salford Town Council has appointed Mr. H. J. Roscoe, of London, superintendent of their hired-motor department, at a salary of £120 per annum.

Mr. G. Bartholomew, Charge Engineer in the Woolwich Electricity Department, has resigned his appointment to take up a similar position with the Electric Supply Corporation, Ltd.

The salary of Mr. Jos. Boyce, Assistant Electrical Engineer to the Darwen Corporation, has been increased from £123 10s. to £130 per annum.

The Warrington Tramways Committee have increased the salary of Mr. John Telfer, Tramways Manager, from £208 to £234 per annum.

NEW COMPANIES

PEARSON & COX, 1 Tudor Parade, Beckenham Lane, Shortlands, Kent. Capital £2,500. Electrical and mechanical engineers.

TRANSIT CO.—Atherton, Lancs. Capital, £2,000. To construct or acquire tramways and light railways in Great Britain.

"CEDES" ELECTRIC TRACTION, 15 Cockspur Street, London. Capital, £2,000. Electricians, electrical engineers, and manufacturers of motor-cars, &c. Subscribers: G. F. Underwood, director, and K. D. Bowers, electrical engineer, Sutherland House, Surbiton.

HARPER ELECTRIC PIANO (1910) CO., 258-262 Holloway Road, London. Capital, £30,000 in 28,000 participating ordinary £1 shares, and 20,000 deferred shares of 2s. each. To supply electric pianos, &c., to cinematograph theatres and other places of amusement, and to erect an "electric" theatre at Islington.

NEW LIVERPOOL RUBBER CO.—Registered by Jordan & Sons, Ltd., Chancery Lane, London. Capital, £150,000 (52,000 5½ per cent. cumulative shares). To take over the business of the Liverpool Rubber Co., incorporated in 1894.

LEAKE-SUMNER GUN FIRE CONTROL SYNDICATE.—Registered June 9th, capital of £1,500, to carry on the business of engineers, manufacturers of and dealers in apparatus used in connection with electric signalling, &c., and to acquire from H. C. Leake and O. Sumner and turn to account certain inventions relating to gun fire control and improvements therein, &c. Private company. Registered office: 39 Victoria Street, Westminster.

J. H. WALLACE & CO.—Registered by Surtees, Phillpotts & Co., 4 Bishopsgate, London, E.C. Capital, £5,000. Manufacturers of and dealers in electrical and other machinery.

NEW AFRICAN CONCESSIONS SYNDICATE.—Registered by Hollams, Sons, Coward & Hawksley. Capital, £50,000. To acquire African Concessions, Ltd. (registered in 1895), and carry on business as suppliers of electricity, &c.

DE LAVAL IGNITER CO., 64a Broad Street, Birmingham. Capital £1,500. Manufacturers of and dealers in dynamos, motors, switchboards, controllers, resistances, &c.

Telegraph Traffic.—The cable between Fort de France, Martinique and Paramaribo, Dutch Guiana, failed on the 25th ult. Telegrams for French and Dutch Guiana must now be sent *viâ* Salinas. On the 27th ult. the cable between Bonny and Duala was only working intermittently, and was put in order the same day.—The Gibraltar-Tangier cable has once more given out; there have been several interruptions to this line during the present year.—Lastly, the line between Bagdad and Bassorah succumbed on 4th inst.—A new cable from Waterville, Ireland, to Weston-super-Mare has been opened for traffic by the Commercial Cable Co. This company has also renewed a considerable section of their cables from Waterville westward with a heavier type of cable in view of damage from trawlers.

After-Effects of an Electric Shock.—At the Shoreditch County Court on Tuesday an action was heard under the Workmen's Compensation Act, before Judge Bray. The applicant, F. S. Sharpe, was formerly employed at the Shoreditch Borough Council electricity works, and received a shock in December, 1908, by his rule coming into contact with a live conductor when measuring up cable. He had also been badly burned and laid up for fourteen weeks by a previous shock in 1904. It appears that the Insurance Co. stopped payment of compensation in April last, but the man was still suffering from traumatic neurasthenia, and was not able to do regular work. He therefore brought the action for continuance of payment of compensation. He was now in receipt of 9s. 4d. a week from his sick club. The Judge suggested that the Insurance Co. should send him away for a month, and then the Shoreditch Borough Council might try the experiment of giving him light work. The hearing was adjourned for that purpose.

SUMMARY

The North-East London Railway Bill, which applied for an extension of time in which to construct the line, has been rejected. The line will probably be abandoned. The London Electric Supply Bill has been passed by a Committee of the House of Commons. (Page 456.)

The list of awards at the Japan-British Exhibition has been announced. A number of prizes and medals are given in the Electrical Engineering Section. (Page 456.)

An article by Mr. L. H. Walter gives a detailed description of the equipment of the new wireless telegraph station of the French post-office at Boulogne. A directive equipment on the Bellini-Tosi system is provided, as well as a non-directive arrangement. With a wave length as short as 600 metres, communication is kept up daily with Algiers with an expenditure of only 500 watts. The directive system is found to give much greater range than can be obtained with the non-directive aerial and to enable interference of other stations in the neighbourhood to be largely avoided when receiving. (Page 457.)

The subscribers to the main Copenhagen Telephone Exchange have been transferred to a new exchange on the central battery system. Previously to the change-over, condensers were added to the subscribers' instruments, but were left short-circuited with a copper wire, which the subscribers were directed to cut themselves on the day of the transfer. (Page 459.)

The Council of the Austrian State Railways have passed a resolution in favour of discontinuing the use of gas lighting on passenger trains and the universal adoption of electric train-lighting. (Page 460.)

An electric steel furnace, combining the advantages of the arc and resistance types, is described in a Paper by Paul Girod. The electroplating plant of the National Cash Register Co., of Ohio, and the processes employed there are described, and some notes are given on the new plant installed by the Consolidated Nickel Co. of America, for the manufacture of nickel silicide by the direct reduction of ores in the electric furnace. (Page 460.)

A method of fault localisation, described in a recent Paper by Mr. W. A. Toppin, at Glasgow, consists of pushing a carrier containing a voltmeter and two brushes along the surface of the ground over the cable. One terminal of the voltmeter is connected to a steel rod driven into the earth a few yards from the route, and the other terminal is connected to the brushes. The Paper also dealt with the arrangement of a testing panel for a three-wire network, and both subjects were discussed by several speakers. (Page 461.)

Our Monthly Article on new electrical supplies and accessories includes illustrated descriptons of a new flame arc lamp, a new metal filament candle lamp, and a rainproof cap for incandescent lamps. A new inter-

Digitized by Google

locked ironclad switch and fuse is also described, and further novelties dealt with include a new toaster and an electric fountain. (Page 462.)

THE latest form of tramcar controller manufactured by the General Electric Co. is described and illustrated on page 464.

A PATENT by Mr. D. B. Morison, of Messrs. Richardsons, Westgarth & Co., Ltd., for a method of automatically regulating the admission of steam into heat accumulators used in conjunction with low-pressure turbines supplied with exhaust steam from intermittently working engines, has been granted in spite of the opposition of the French company owning the Rateau patents for heat accumulators. (Page 465.)

IN the Chancery Court, before Mr. Justice Neville, an action is being heard against the West Ham Corporation, at the instance of the India Rubber, Gutta Percha & Telegraph Works Co., Ltd., in respect of the financial management of the electricity undertaking. It is alleged that certain overdrafts at the Bank have been made in the absence of sanction from the Local Government Board, and are therefore illegal, and consequently the interest which is being paid to the bank is recoverable. It is further complained that the statutory provisions in regard to sinking fund is not being complied with. (Page 465.)

A NEW memorandum of requirements regarding tramway equipment has been issued by the Board of Trade. (Page 465.)

AMONG the specifications published by the Patent Office on Thursday last was one by Siemens Bros. & Co., Ltd., F. Hird, and G. S. Grimston for double-barrelled searchlight projectors.—A form of rotary converter with unwound commutating poles, energised by the armature reaction, is protected by the British Thomson-Houston Co.—S. K. Thompson patents a counterweight pendant with separate pulleys for the different conductors.—Another specification published is that of the Denny tumbler switch with overload release. (Page 466.)

BRADFORD Corporation are giving a trial to the "Norwich" system of charging.—Glasgow tramway accounts for last year show a net profit of £53,028, the Manchester tramway accounts £133,321, and the Sheffield tramway accounts £39,252.—There is a loss of £2,035 upon the Sheffield electricity accounts for last year.—Torquay Council have refused to sanction the overhead system of tramways in substitution for the Dolter surface-contact system.—Arbitration is to be resorted to at Winchester in connection with the purchase of the local electric supply company, and at West Hartlepool for the purchase of the tramway company.—Worcester wiring contractors protest against the Electricity Department selling heating and cooking apparatus. (Page 467.)

AN electric lighting scheme has been reported upon at Sevenoaks; mains are to be extended at Hove; extensions to generating plant are contemplated at Poplar, York, and Aldershot. Generating plants are to be installed at the Leith Docks and at Barnet Workhouse. Tramcars are required at Walthamstow. The L.C.C. are purchasing some electrical vehicles for Fire Brigade purposes. (Page 468.)

THE net profit of the General Electric Co. for 1909 was £55,904.—The Electric Construction Co.'s accounts for last year show a net profit of £10,811, and complaint is made that the works have not been fully occupied during the year. No dividends are paid on the ordinary shares.—The half-yearly dividend of the City and South London Railway Co. is 1¼ per cent., against 1¾ per cent. last year.—A scheme of capital reorganisation is under consideration by Edmundson's Electricity Corporation. (Page 470.)

PARLIAMENTARY INTELLIGENCE

HANDSWORTH DISTRICT COUNCIL BILL.—This Bill was before the Local Legislation Committee of the House of Commons last week It confers further powers upon the Handsworth District Council in reference to the tramways, among other things. The cost of the tramways proposed is £67,000, and for street widenings and new streets the sum of £17,000 is included. The Birmingham Corporation opposed the Bill in view of the proceedings in connection with the Birmingham extension scheme, which will include Handsworth. After some discussion and private deliberation, the Committee decided to postpone consideration of the Bill for a fortnight, or until a decision has been come to on the Birmingham Order.

NORTH-EAST LONDON RAILWAY BILL.—This Bill was before a House of Lords Committee last week, and during the proceedings the promoters asked leave to withdraw it on the ground that they found themselves unable to raise the necessary capital. The Great Eastern Railway Co., who opposed the Bill, asked the Committee not to allow it to be withdrawn, but to reject it. Mr. Freeman, K.C., for the Great Eastern Co., said he would then ask for costs on the ground that the company had been unreasonably and vexatiously put to expense, in accordance with the Standing Orders of the House. After a little discussion the Committee took this view, and declared the preamble not proved; they further decided that the Great Eastern Railway Co. were entitled to their costs in respect of the opposing Bill.

The North-East London Railway was authorised in 1905, an important condition in the Bill being that half the capital should be raised within twelve months. This, however, was not possible, and the promoters of the Bill have been granted four extensions of time. The present Bill applied for a further extension of time. The proposed line is from Shoreditch to Waltham Cross, and runs through the populous district of north-east London, where it would be in competition with the Great Eastern Railway.

PROGRESS OF ELECTRICAL BILLS.—The Metropolitan Railway and the Reading & District Electric Supply Bills were read a third time in the House of Commons on Friday.

The L.C.C. (Tramways and Improvements) and the Southampton Corporation Bills were read a second time in the House of Lords on Tuesday.

Leeds Corporation Bill was read a third time in the House of Commons on Wednesday last week.

Belfast Corporation Bill was read a second time in the House of Lords on Thursday.

London Electric Railway Amalgamation Bill was read a third time in the House of Commons on Monday.

LONDON ELECTRIC SUPPLY BILL.—This Bill, which provides for the purchase by the London County Council of the five West End electric lighting companies, was passed by a Select Committee of the House of Commons on Tuesday. There was no opposition.

AWARDS AT THE JAPAN-BRITISH EXHIBITION

THE Jury of the Japan-British Exhibition have made the following awards in the Electrical Engineering section:—

Grand Prizes.—The Dowsing Radiant Heat Co., Ltd. (medical baths and heating appliances); Electromotors, Ltd. (balancer set, motors, &c.); India Rubber, Gutta Percha & Telegraph Works Co., Ltd. (telephone apparatus and rubber goods); Osram Lamp Works, Ltd. (metal filament lamps and fittings); Western Electric Co., Ltd. (telephones and cables); the Chloride Electrical Storage Co., Ltd. (cells and accessories).

Diploma of Honour.—Newtons, Ltd., Taunton (direct-current generators and motors).

Gold Medals.—John Dugdill & Co. (moving and extending fittings); the Maxim Lamp Works, Ltd. (flame and enclosed arcs and metal filament lamps; Bertram Thomas (electric cooking appliances); the Float Electric Co., Ltd. (mining lamps and small batteries).

Silver Medals.—P. & J. Jackson & Co. (small house-lighting set and appliances); Lambie, Wrigley & Co. (fans, switchboard, and accessories).

The distribution of the awards will be made in the Congress Hall at the Exhibition on July 15th at 3.30 p.m. H.R.H. Prince Arthur of Connaught will preside.

Electric Traction in Victoria.—In the speech made by the Governor on the opening of Parliament on July 6th, reference was made to the appointment of a Royal Commission to consider the future of the Melbourne tramways, which are on the cable system and are privately owned. The proposed conversion of the suburban railways is also to be thoroughly inquired into again.

The Leicester Fittings Case.—The Sheffield Electric Light Committee propose to contribute £25 towards the cost of an appeal against Mr. Justice Neville's recent judgment that a Corporation carrying on an electric lighting undertaking is not entitled to wire premises and supply electric fittings without special Parliamentary powers.

DIRECTIVE WIRELESS TELEGRAPH STATION AT BOULOGNE

By L. H. Walter

THE new station of the French Administration des Postes et Télégraphes at Boulogne, which has recently been completed, is of special interest in that it represents the first example of a new departure in commercial radiotelegraphy. All other stations, on whatever method equipped, only differ in what are really minor matters of detail. This station has a nominal range of 300 kilometres, but actually much greater distances are covered. It is one of a chain of stations which the French Government recently decided to erect with a view to ensuring regular communication in the event of further possible trouble, such as was caused by the recent strike of telegraphists. Since the stations can be occupied by the military in case of need, the Boulogne station has, further, a strategic value.

As the result of exhaustive trials with the Bellini-Tosi directive system, the engineers decided to equip

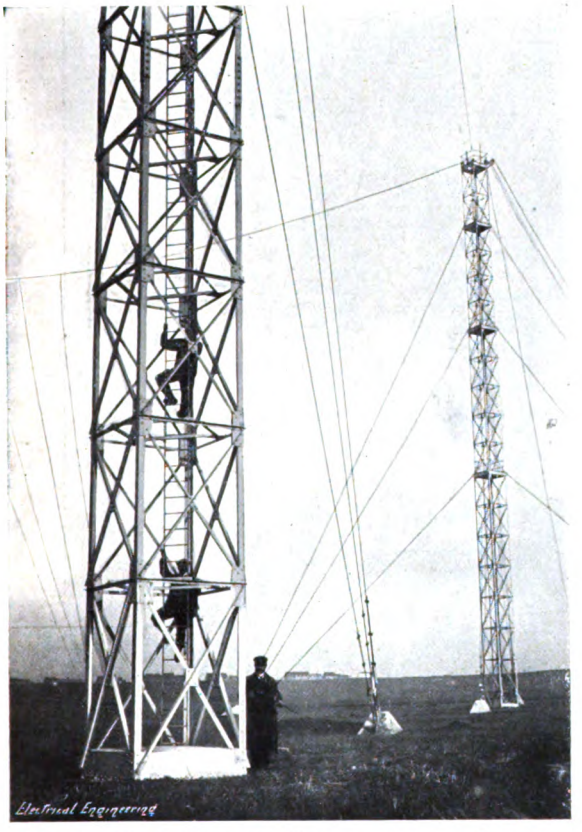

FIG. 1.—VIEW SHOWING CONSTRUCTION OF TOWERS.

the new station not merely with an installation on the ordinary system, but also with the directive method, as by this means they would be able to secure all the advantages which recent advances in radiotelegraphy have made available. The development of the Bellini-Tosi method has been traced at length in the columns of ELECTRICAL ENGINEERING from the first experiments onward (Vol. II., p. 771, Vol. III., pp. 348 and 507), and as the system is now well known, it is unnecessary to refer to the principles involved. The writer having recently had an opportunity of inspecting the station is enabled to describe the chief features, and also to refer to the practical results and the methods of working adopted. As already noticed in ELECTRICAL ENGINEERING, the station is situated on the cliff about 2 km. inland, on the high ground known as La Warroquerie; the distance from the river Liane leading to the harbour is, however, much less. The station comprises an aerial structure of four latticework towers, whose construction is shown in Fig. 1. The towers are each 46 metres in height, and spaced at the corners of a square of 80 metres side (see Fig. 2); they support the vertical antenna of the ordinary system, as well as the directive aerials of the Bellini-Tosi system. There are three buildings, one for the generating equipment, one used as stores, and one for the station itself. The generating plant consists of a vertical oil engine coupled to a dynamo, which is used for charging a secondary battery of 60 Tudor cells capable of giving about 25 amperes at 120 volts. These cells are used as the source of current for the transmission.

The station proper consists of a brick building located at the centre of the aerial system. Fig. 3 gives a view of the interior of the operating room, with Dr. Bellini standing on the right and Capt. Tosi on the left. The vertical antenna of the ordinary system is a roof aerial in the form of a horizontal X (see Fig. 2), supported from the tops of the towers. A vertical wire from the mid-point of the cross is led directly into the building, through a vertical tunnel insulator. This latter consists of a vertical tube about 25 cm. in diameter, having a thick glass disc at each end,

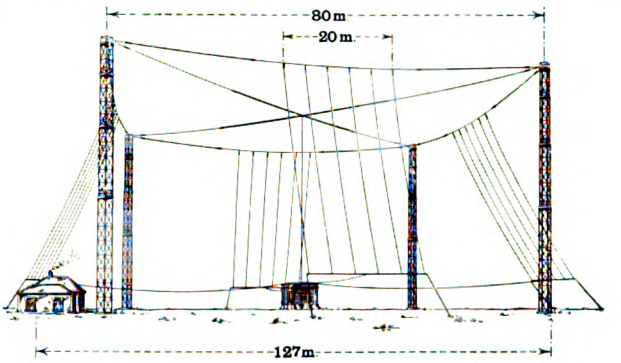

FIG. 2.—SKETCH SHOWING ARRANGEMENT OF AERIAL.

through the centre of which the ebonite insulator is passed. The earth consists of a surface of zinc sheet buried in the ground beneath the station. The directive aerials comprise two Brown aerials set at 90° to one another in the well-known way. The vertical part of each Brown aerial consists of a harp of six wires, each suspended from insulators at the top, attached to a cable strung between the tops of the towers. The wires are hung at the central part of each span, and are spaced 4 metres apart. The lower ends of these wires are joined, and are connected up by a single conductor leading to the station. There are thus four wires which enter the station, and these are led in through tunnel insulators symmetrically spaced around the centre one, which brings in the vertical antenna. The distance between the upper ends of the harps is 81 metres, and at the lower ends 127 metres, the connecting wires leading to the station being supported 8 metres above the ground and thus well out of reach. The transmitting equipment consists of two (one spare) vertical spark coils of the Gaiffe-Rochefort type with motor-driven mercury break, the actual break taking place under water, and being operated by a relay key. In front of these spark coils are the Moscicki condensers, of which there are 14, of the large size, but as three or four of these would suffice, they are connected up in a series-parallel arrangement which allows of finer adjustment. The condenser

Digitized by Google

battery can discharge across either of two spark-gaps—one for the ordinary system and one for the directive system, a simple change-over switch operated by a cord being fitted for this purpose. Two gaps are employed in order that the connections, which are of strip copper, should be as short as possible. The sparking electrodes are in the form of discs about 10 cm. in diameter, with projecting rims, and are perforated; the periphery being so extensive, cooling is facilitated, and it is found that the discs never get overheated.

The arrangement of the ordinary system presents no special feature, it being on the usual lines, direct excitation being employed for sending, according to the usual French practice. For the directive method the spark-gap is connected up to the radiogoniometer (which can be seen high up in the centre of Fig. 3), by means of thin copper strip. In this case the excitation is effected inductively. The change-over switch enables the change from the directive transmission to the ordinary system, and *vice versâ*, to be quickly effected. For receiving, the ordinary and directive systems are combined and made interchangeable in an ingenious manner, so that it is possible, by merely turning a switch handle, to change from (1) ordinary system, direct coupling, to (2) ordinary system, inductive coupling, or to (3) directive system—and this without change of wave-length. Diagrams of connections are given in Fig. 4, these being in the order of increasing selectivity of the circuits, corresponding to the numbers given above. As only detectors of the crystal type are employed, there is a great saving of complication owing to the absence of batteries, potentiometers, &c. The kind of crystal used is iron pyrites, upon which a brass point is pressed.

The wave-length chosen is 300 metres; the vertical antenna is adjusted so that its natural wave-length has this value. The directive aerials were constructed before this short wave-length was decided upon, and so the natural wave-length of each, about 600 metres, is brought up to 900 metres by a special means which does not involve the use of a large and costly inductance. The directive aerial system is caused to operate with a wave-length of 300 metres by exciting on it the harmonic overtone of triple frequency. The results obtained are excellent, however, in spite of what might be considered an undesirable mode of excitation; this point will be referred to later on.

Some interesting quantitative measurements have recently been carried out by Messrs. Bellini and Tosi, which serve to confirm their theoretical prediction that the directive system should, for equal primary energy, have a greater range than the ordinary system, although the inverse view has generally been expressed.

A Duddell thermo-galvanometer, set up at the Column de la Grande Armée, 3 kilometres distant from the station (and thus 10 wave-lengths away), was used to obtain diagrams of the energy radiated in different directions by the Bellini-Tosi system, and for making a comparison of the energy radiated by this system with that emitted by the ordinary vertical antenna. A long series of experiments has shown that, using a single harp of one directive aerial as an ordinary antenna, connected to earth through the radiogoniometer, the mean deflection obtained was 35 mm., with a current of $K \times 0{\cdot}24$ ampere in the antenna. With the complete directive aerial, not earthed, the mean deflection obtained was 113 mm., the current in the aerial being $K \times 0{\cdot}17$ ampere. For equality of current in the aerial systems the deflections work out at 19 mm. with the ordinary antenna, and 113 mm. with the directive aerial. The latter system, therefore, radiates a much greater amount of energy than the ordinary antenna does, the range of the directive system being about 1·8 times that of the ordinary system. This result is attributed to two causes: Firstly, the current loop is completely detached and free in the directive aerials, and is, on

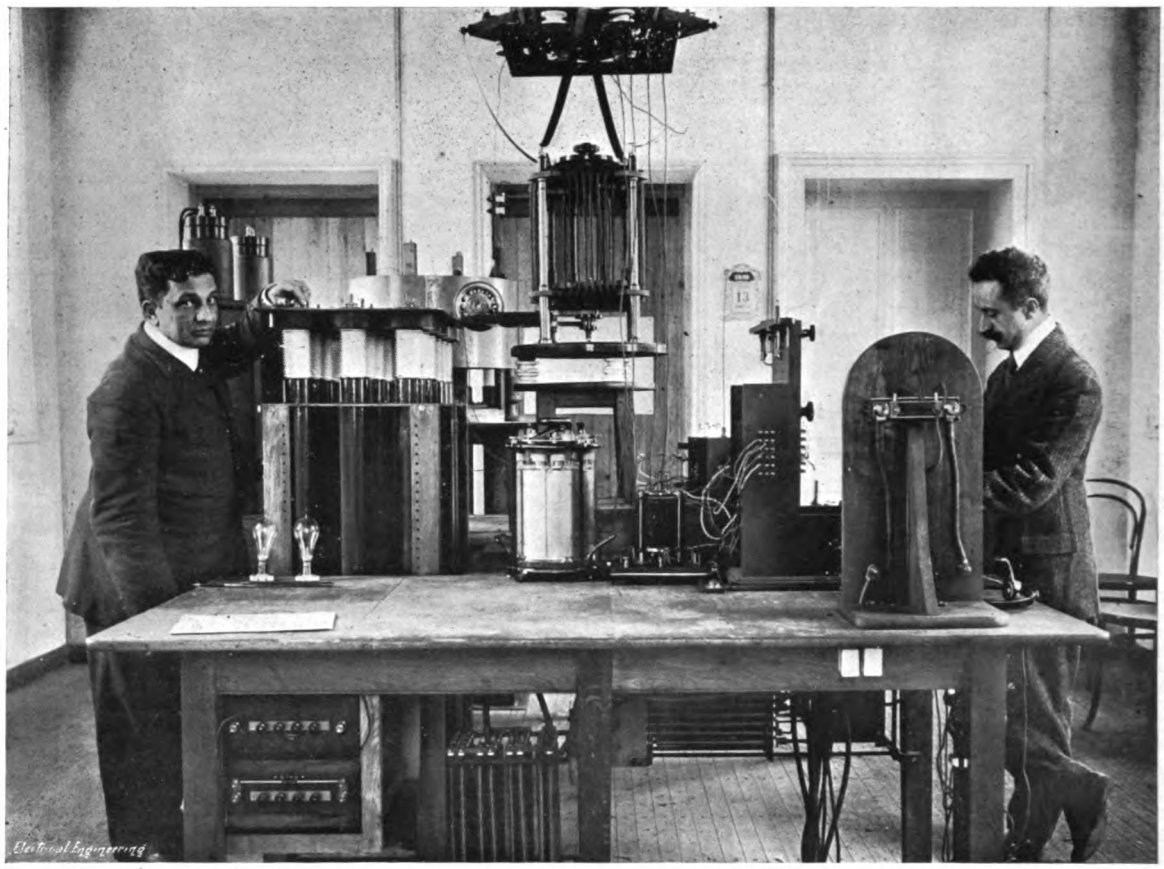

FIG. 3.—INTERIOR OF STATION.

Digitized by Google

the contrary, shut in the station in the case of the vertical antenna. Secondly, the Brown aerials do not require the earth connection, so that the resistance of the earth connection, and the consequent absorption of energy thereby, is eliminated. A further experiment was carried out to meet the possible criticism that a single harp oscillating at the triple frequency was not the best type of vertical antenna to make comparisons with the directive system. For this reason, the single harp was compared (for equal antenna currents and coupling) with the ordinary vertical antenna of the station, excited in the usual manner. It was found that the deflections were 35 mm. and 7 mm. for the harp and for the vertical antenna respectively. Thus the radiation of the harp is unquestionably superior; in fact, had the comparison been made between the complete non-earthed directive aerial and the ordinary antenna, it is seen that the deflections obtained would be in the ratio 113:7. It must be borne in mind that even here the most favourable conditions are not quite realised, since the distance between the two harps of each directive aerial is less than 150 metres, the half wave-length.

Turning now to the practical results achieved, the station has been used for ship to shore and long-distance communication. Using only 500 watts of primary energy, regular communication is maintained nightly with Algiers (1,600 kilometres, 1,100 of which are over land), which for the short wave-length used may be considered very good. Even at this great

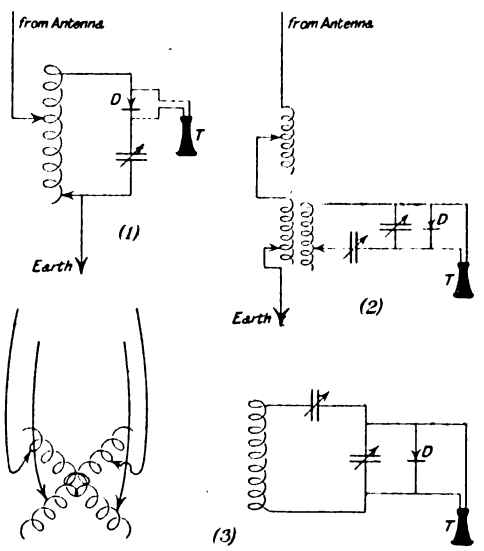

FIG. 4.—DIAGRAMS OF CONNECTIONS.

distance the signals from the directive system are always found to be notably stronger than from the ordinary system; in the usual method of estimating the strength of signals, the directive signals were, for instance, found to be No. 6, while those from the ordinary system were No. 4.

For ordinary purposes, such as listening for messages, the ordinary system is, of course, employed, unless it is desired to pick up signals from a known direction only; in practice, however, it is found that the operators almost invariably change over to the directive method so soon as they have picked up the message. This is only natural, for anyone familiar with the conditions in this part of the Channel knows that there are often too many signals about simultaneously for reception to be comfortable, or even possible. The directive method, besides enabling the direction of the incoming messages to be ascertained, serves to cut out, independently of tuning, a great number of signals which it is not desired to hear while another message is proceeding, if these come from quarters which are not nearly in the line of communication. It has, however, further selective properties which depend upon the wave-length. Thus the Scheveningen station, which is very powerful and only 240 km. distant, although it uses a wave 600 metres long, gives strong signals on the ordinary system receiver, although this is tuned to 300 metres; but it has been found impossible to hear the Scheveningen signals when using the directive system. Similarly the Dunkirk station (600 metres wave-length), only 70 km. distant, gives very strong signals in the ordinary receiver, while with the directive system it is practically only just possible to hear them.

In conclusion, although it is somewhat early to judge, there seems little doubt that the results obtained at this station are bound to have a marked effect upon the future of radiotelegraphy. Hitherto the directive method has not been favoured, solely because in the early days the range appeared to be less than that of the ordinary system. Now that this fallacy has been exposed its advantages should soon make themselves felt.

NEW TELEPHONE EXCHANGE IN COPENHAGEN

ON Saturday night, June 18th, the Copenhagen Telephone Co. transferred the subscribers on its main exchange in Yorks Passage to a new exchange in Nörregade. The old exchange was on the magneto system, with local batteries at the subscribers' stations, but in the new exchange the common battery system, with lamp signalling, is employed. It is interesting to note how far behind London Copenhagen has been in adopting the most modern methods in telephony, although so much is spoken in ill-informed quarters of our backwardness in telephony compared with Scandinavian countries. The Copenhagen Telephone Co. has moved slowly and cautiously, as a smaller exchange, the "Byen" exchange, was first equipped on the C.B. system—in the present building in Nörregade. It has been in operation for some time, and the two exchanges now occupy the same building. The new central exchange is equipped for 18,000 subscribers. An interesting feature of the change over was that condensers were first added to the subscribers' instruments in the usual way to render them suitable for C.B. working, but these were left short-circuited with a copper wire. The subscribers were directed to cut the short-circuiting wire themselves on the day of the transfer, and, according to *Ingeniören*, some of them, in their endeavour to do this thoroughly, severed all the wires leading to their instruments.

The Post Office Electrical Engineers' Journal.—The July issue of this magazine contains, amongst other matters of interest, some photographs of the laying of the new Channel telephone cable with Pupin coils. No particulars are given of the cable, but our readers will remember the illustrated details which appeared in a special article in ELECTRICAL ENGINEERING, March 17th, page 179.

The London County Council and the Imperial College of Science.—On December 21st, 1909, the London County Council decided to make, as in the previous year, a maintenance grant of £8,000 to the Imperial College of Science and Technology, South Kensington. In return for this grant it secures the privilege of nominating 25 students for one year's free instruction at the College. These nominations are now to be made for the first time. The instruction will be of an advanced nature, and, therefore, only advanced students who are qualified to enter on the fourth year of the course should apply. There is no restriction as to income, but intending candidates must be ordinarily resident in the administrative county of London, and must be students at an institution aided, maintained, or approved by the Council. The free studentships do not entitle the holders to any maintenance grants, but cover all ordinary tuition fees. No examination will be adopted for the final selection of the students from the applications received. The free studentships will be awarded on consideration of the past records of the candidates, the recommendations of their teachers, the course of study they intend to follow, and generally upon their fitness for advanced study in science applied to industry. It is quite possible that, in special cases, the free places may be extended to two or more years. Application should be made without delay, as entries will not be considered after July 23rd, 1910. Application forms can be obtained from the Education Officer, London County Council, Victoria Embankment, London, W.C.

ELECTRICITY v. GAS FOR TRAIN LIGHTING

OUR attention has been directed to the movement which is being made in various quarters to secure freedom from the liability for serious fires in railway accidents by the suppression of gas lighting on trains and the universal adoption of electric train lighting. It will be remembered that only last month it was reported from Paris that the express train, which met with the bad accident at Villepreux, was gas-lighted, and that the gas tanks were the cause of the burning of the cars.

Energetic action is being taken in Austria, and, according to the Vienna papers, the following resolution, moved by Director M. Krassny, was passed recently by the Council of the Austrian State Railways: The Imperial and Royal Ministry for Railways are requested to discontinue the use of gas light in passenger trains, and to use electric lighting in future for all passenger cars, including those at present on order. In the discussion, the success of electric train lighting systems was enlarged upon, and it was mentioned that the Italians were gradually doing away with gas for train lighting. Among the accidents in which fires caused by the gas have led to loss of lives of passengers uninjured by the accident itself were those at Marburg and Herlishein in November, Tenton, Missouri, in December, the shocking accident in Uhersko on Christmas Day, 1909, and the accident on the Canadian Pacific Railway in January. It was reported that the Administration of the Northern Railway of Austria has finished a series of tests, which have shown that, taking into consideration recent improvements, the system of lighting by electricity now presents economic advantages. Owing to the introduction of the metallic filament lamp, the consumption of electrical energy is reduced to nearly one-third of the previous value. They have decided, as a result of these tests, that not only should old cars be converted, but that for the 110 new cars to be supplied in 1911, electric lighting should also be used. In his *résumé*, Mr. Krassny gave a comparison of the costs of the electric and gas lighting, and mentioned that all Swiss railways, and the great French railways, have decided to adopt in future electric lighting exclusively.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

At the last meeting of the Faraday Society, a paper was presented by Paul Girod—"Studies in the Electrometallurgy of Ferro-Alloys and Steels." Girod is so well known as the pioneer in the manufacture of ferro-alloys in the electric furnace, that a paper by him is always interesting. The chief interest in this paper is his contribution to the subject of electric steel. The furnace which he has designed is of the oscillatory type, so that it can be tipped for pouring or cleaning. Inside the furnace are rods of iron embedded in the fire-brick for carrying the current, in such a way that they penetrate the lowest part of the metal charge. The other electrode passes through the roof of the furnace. When the Girod furnace is freshly charged with cold matter, the resistance of the charge is sufficiently great to convert almost the whole of the energy into heat; short circuits are thus avoided. Even when the metal is melted the charge always offers sufficient resistance to absorb 10 to 15 per cent. of pressure across the furnace, this resistance still being sufficient to prevent short circuiting. Girod considers that the methods adopted tend to unite all the advantages that can be gained from the arc and resistance furnaces.

The second paper was by Mr. E. F. Law on "The Failure of Light Engineering Alloys, particularly the Aluminium Alloys. The author described how some of the alloys, after being made and remaining apparently in good condition for some time, would spontaneously crumble to a fine powder.

The third paper was by Dr. F. Mollwo Perkin on "Quartz Mercury Vapour Lamps." He first described one of special design which he had made to investigate the effect of ultra-violet rays on gases or mixtures of gases. This lamp is a double tube, the inner one being evacuated and has the mercury arc struck within it. An outer mantle is fused over this, and has a tube fixed into it at either end, so that gases may be passed through and afterwards collected for examination. Mention was made of the union of sulphur dioxide and oxygen to form sulphur trioxide, which can then be passed into water to form sulphuric acid; this has, indeed, been patented in Germany. Dr. Perkin also referred to the extraordinary sterilising action of the ultra-violet rays. In Paris water is actually being sterilised on a large scale by means of these rays. One of the lamps was shown in operation; even on the 100-volt circuit this showed extreme brilliancy, although it had been made for a 200-volt circuit.

Metallurgical and Chemical Engineering of May contains a description of the modern electroplating plant of the National Cash Register Co., Dayton, Ohio. The plating room has a floor space of 540 by 60 feet. There are 105 plating tanks, which are separately equipped with ammeter, voltmeter, and rheostat, so that each tank may be separately controlled. Ninety-three of the tanks are for "wire work," that is, the plating of comparatively large pieces, plates, rods, &c., which are suspended in the bath by wires twisted round the cathode bar. The 12 other tanks are fitted with wicker-work baskets, each basket having a capacity of from two to three pailfuls of bolts, nuts, and other small parts. During the operation of plating the baskets are slowly rotated in the electrolyte. The cleaning of the iron and steel articles before plating is electrolytic. The articles are made the cathode in an electrolyte (probably caustic soda, the material of the electrolyte is not given), and the vigorous evolution of hydrogen loosens and carries away the impurities. Bronze castings are cleaned with soapy water and caustic soda. The acid dipping room is 20 by 60 feet, but there are special pickling tanks for hydrochloric, hydrofluoric, and nitric acids in a separate room, from which the acid fumes are carried away by fans. As showing the size of the plant it may be mentioned that 30,000 gallons of the nickel-plating solution are in use, 4,000 of zinc solution, 6,000 gallons of copper sulphate, 800 gallons of silver solution, beside others. For current purposes six direct-current motor-generator sets are used. They are run from a 225-volt circuit, the speeds varying from 450—850 revs., and have outputs from 400 to 4,000 amperes, at 6 to 12 volts. Some are shunt and some are compound wound.

The Consolidated Nickel Co. have just put down a new electric plant for the manufacture of nickel silicide, at Webster, Jackson County, N.C. The processes previously tried were leaching, but they all had to be abandoned owing to excessive cost. The new process is an electric furnace one, devised by Dr. Charles T. Hennig, of Brooklyn. The ore consists essentially of hydrated nickel-magnesium silicides, and contains from 1·5 to 7 pe cent. nickel, in rare cases 12 per cent. Dr. Hennig has found that this low grade ore can be successfully converted into a marketable product by direct reduction with coke in the electric furnace. The ore is crushed and mixed with 10 per cent. of crushed coke, this is then smelted in the furnace, and various grades of nickel silicide, from 10 to 30 per cent. nickel, can be obtained. The furnace is made of a sheet steel shell $\frac{5}{8}$ in. thick, and 6 ft. in diameter, and 5 ft. high. This is bolted on to a $\frac{3}{4}$ in. plate, which is connected to one pole of the electric circuit. The bottom of the furnace thus acts as one electrode; it is formed of a number of iron rods cast into the base plate to act as conductors, around which carbon is rammed to form the hearth. The interior of the furnace is lined with fire brick, so that its internal diameter is 4 ft. A cap covers the top of the furnace, and through this the second electrode, a carbon block, is suspended. The generators have six poles and are wound to give a current of 6,800 amps, at 50 volts. They are guaranteed to maintain an over-load of 100 per cent. for two hours, and of 150 per cent. for 10 seconds, without undue heating. As a sudden load of 50,000 amps. is liable to occur, all the 'bus-bars, circuit-breakers, &c., were designed accordingly. The machines were built by the Western Electric Co.

Under "Electrometallurgy and Electrochemistry," on p. 450 of ELECTRICAL ENGINEERING of last week, the annual output of crude ingots of the Lindenberg Steel Works was given as 5,000 *lbs.* This should, of course, have been 5,000 *tons.*

National Telephone Co.'s Staff.—According to the *Daily News*, the position of many of the higher-paid officials of the National Telephone Co., after the transfer of the business to the Post Office, is assured. It is common knowledge that the company is largely interested in the Constantinople telephone concession which has been negotiated by Mr. H. Laws Webb. Our contemporary states that the company which will be formed to work this concession will have its headquarters in Paris, and that those members of the National Telephone Co.'s staff in receipt of over £700 per annum will be offered employment there.

Boiler-Furnace Patent Litigation.—In the Chancery Division of the High Courts on Thursday, Messrs. Babcock & Wilcox, Ltd., sued Messrs. E. Danks & Co., of Oldham, for alleged infringement of the patent No. 20,779 of 1898, which relates to a certain furnace, the invention of a Mr. Harrison, of Middlesbrough, used in connection with blast-furnace gas. The case was a curious one, for no actual infringement took place, action being taken on the strength of a letter sent to the Kettering Coal & Iron Co., in which Messrs. Danks offered to sell them a latest improved Harrison furnace. It appears that although Mr. Harrison is taking royalties from Messrs. Babcock & Wilcox, Ltd., in connection with patent No. 20,779 of 1898, he has also been designing furnaces for Messrs. Danks, a fact which, when it came out in evidence, caused some surprise to the representatives of Messrs. Babcock & Wilcox. Mr. Justice Warrington, without calling on counsel for Messrs. Danks to put their case, decided that there had been no infringement, and gave judgment for defendants with costs. A counterclaim for the revocation of the patent in question, on the ground of anticipation, was abandoned by Messrs. Danks.

MAINS TESTING AND FAULT LOCALISATION

At the May meeting of the Glasgow Section of the Institution of Electrical Engineers, a Paper on mains testing and fault localisation was read by Mr. W. A. Toppin (Assistant at the Greenock Burgh Electricity Works). He expressed the opinion that more interruptions of supply were occasioned by faults on the mains than by all other causes combined, and deprecated the practice of allowing earth leakages to develop to a pronounced stage before adopting remedial measures, as his experience is that 90 per cent. of mains faults originate in earth leakages, which can be located and removed before they reach the critical stage.

The Paper next indicated the arrangements recommended for a pair of testing and earthing panels to meet the Board of Trade requirements on a three-wire system. The middle 'bus-bar is connected to an earth-plate of ample dimensions through an indicating ammeter, a recording ammeter, and a circuit-breaker, which acts when the current flowing from the middle 'bus-bar to the earth-plate exceeds 25 amperes. Across the circuit-breaker is a 10-ohm resistance to limit the current when a dead earth occurs. When the circuit-breaker opens, a circuit is also made through an indicating lamp, and a relay on the recording ammeter which actuates a needle, and records the time during which the cut-out is open. This constitutes the arrangement of the earthing panel. On the panel for testing the outers, either the + or − 'bus-bars can be connected by means of a throw-over switch to the earth-plate through a central zero ammeter, a circuit-breaker, and a resistance, divided into three steps, and thus allowing the passage of maximum currents of 50, 100, and 150 amperes respectively. This panel can also be used to burn out a fault on either main by disconnecting the middle wire earth and earthing the other mains through the resistance regulating switch.

A record of the faults which have come under the author's notice during the last few years have shown that fully 80 per cent. of the earths occurred on the negative side. In almost every case of breakdown in a negative conductor the core was found saturated with moisture for four or five feet on each side of the fault, while the bitumen covering, which under normal conditions was unaffected by moisture, was converted into a spongy state. In cases of faults affecting both outer conductors, the positive core was found to be quite dry, while the surrounding bitumen was in its normal state, or only affected by the heat generated by the leakage current.

The author advocated the division of the network into sections with disconnecting links in convenient pillars, and the fusing of each distributor cable at its feeder pillar, so that, in the event of a short circuit, the faulty section is automatically isolated from the system. He is also of the opinion that all feeders should be provided with ammeters on each conductor, to aid the observation of momentary faults of too short a duration to melt the fuses.

In conclusion, the author described a method which he had found of service in locating earth leakages without interrupting the supply. When an earth leakage occurs, the earth in its vicinity is charged to a potential above normal earth potential. This potential will diminish with the distance from the fault. A voltmeter, calibrated to read down to very small pressures, is employed. One terminal is connected to a good earth connection, such as a steel rod pushed into the ground at a distance of two or three yards from the cable route. The voltmeter is attached to a light carrier, to which two steel brushes connected to the other terminal are attached, so as to make a continuous contact with the surface of the earth, and this is pushed over the ground above the cable route and the fall of potential between the earth connection and the ground in contact with the brushes is shown on the instrument. In addition to the voltmeter, the carrier is fitted with a small revolving drum which winds or unwinds the earth lead as required. To obtain more accurate measurements a centre zero low-reading voltmeter with multiplier is connected between the two brushes—insulated from one another—when the exact location of the fault may be effected by moving the carrier until the voltmeter reading becomes zero. In the case of a two-wire supply, it is necessary to earth the unaffected conductor to give the required potential difference surrounding the fault.

DISCUSSION.

Mr. D. M. McLEOD (*Resident Engineer, Clyde Valley Electrical Power Co.*) was of opinion that this system of localising faults would not prove successful if used with lead-covered mains, and that granolithic and wood paving would also tend to make the readings obtained so small as to be of negligible value. His own company's mains are divided into easily tested sections, and each section has allocated to it a card on which the records are inscribed from time to time. In this way a completely continuous record of the mains insulation is obtained, and it is easy to prevent incipient faults from developing. To illustrate his point, Mr. McLeod had brought to the meeting a section of three-core E.H.T. lead-covered cable, which had been very badly twisted and damaged to the extent of having had some of the lead removed owing to a subsidence on the cable route. This fault had been discovered in its incipient stage in time to prevent serious trouble. Mr. McLeod also mentioned that he found that testing the telephone and relay cables proved a useful guide, as the lead covering on this class of cable is so much thinner that any trouble which tended to affect the lead made itself more readily felt than was the case on the main cables.

Mr. W. W. LACKIE (*City Electrical Engineer, Glasgow*) found himself in agreement with the author as to the proportion of trouble developing on the mains as compared with other parts of the system. One of the difficulties which was most exasperating was that when a fault did occur it often burnt out the only evidence of what caused the trouble. In Glasgow they found their recording ammeters on each feeder of great value in warning them of possible trouble. He was not in favour of linking up the distributing networks between feeder pillars, as although it was claimed in theory that by accurate fusing one was able to isolate faulty sections and to maintain supply, he was of opinion that, in practice, the system only introduced further complications when faults did occur, and at the same time there was no saving of copper.

Mr. WILLIAM MCWHIRTER (*Messrs. William McWhirter & Son, Glasgow*) thought that the success of the method of fault localisation described was due in no small degree to the prevailing wetness at Greenock.

Mr. W. D. MORGAN (*late of Coatbridge & Airdrie Electricity Supply Co.*) was of opinion that the testing panel described was not altogether satisfactory, as a careless switchboard attendant might make a dead short through the earth connection. Raising the voltage of the outer cable which was not affected, to, say, 480 to 500 volts above earth, might land the supply concern into trouble if fire or accident occurred on consumer's premises. He agreed with Mr. McLeod in thinking that lead-covered cable, or cable in the vicinity of iron pipes or tramway rails, could be very faulty without the method described, enabling one to find the fault very quickly.

Mr. J. ROBERTSON (*Chief Electrical Engineer, Greenock*) also thought that the fault localiser described would probably fail with a lead-covered system; in Greenock practically all the cables were laid solid in wood troughing. For Mr. McWhirter's information he might say that a large portion of Greenock was under high water level, and the earth was therefore well saturated with salt. The result was that they had many small faults of, say, one or two amperes capacity, and the only practical method of dealing with them was that described. He did not agree with Mr. Lackie's statement regarding the economy of copper with a closed end distributing system.

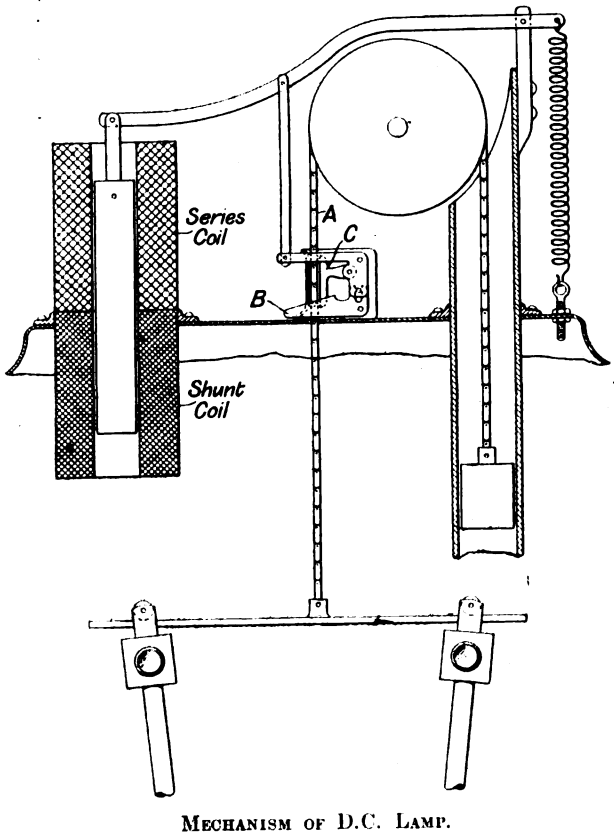
Mr. G. AUSTIN (*Messrs. W. C. Martin & Co., Glasgow*) asked if the author had ever tried the compass method of localisation. He, Mr. Austin, had found this method very useful in testing for faults on ship circuits.

Mr. J. CAMPBELL MCMILLAN (*Electric Control, Ltd.*) thought that similar apparatus must have been used when the system of the Chicago Supply Co. was revised some time ago. The whole city was divided into districts, and tests were taken throughout with a view to deciding what additional cable should be put in, the result being that a considerable number of auxiliary conductors were installed on the negative side of the system.

Mr. F. C. RAPHAEL (in a written communication) explained that while Mr. Toppin's method of fault finding would doubtless be extremely useful for V.B. cables, it would be liable to give misleading results on lead-covered cables, as the higher potential might occur, not by the fault itself, but at the nearest point where the lead of the cable was making a good or a fair earth. Return currents from running trams would also interfere with the method. He mentioned that a similar principle had been used in Berlin to notify automatically at the station, by means of indicators, the district in which the potential of the earth near the mains had risen. He also described the "shocked boy" method of finding bad faults in rubber cable in the factory. A few hundred cells of an earthed battery were connected to the cable, which was wound on to a drum, and guided by a boy standing on an earthed metal plate, and holding a wet cloth. When the fault came through the boy's hands he could invariably be relied on to notify the fact, the intensity of his signal depending upon the number of cells employed.

Mr. P. F ALLAN (*Clyde Valley Electrical Power Co.*) commented on the Board of Trade testing panel described. He drew attention to the fact that according to the new Home Office Regulations it was permissible to run for prolonged periods with one outer of a three-phase or three-wire D.C.

Digitized by Google



system earthed. He agreed with Mr. Morgan, however, that if this was done on a town network, and trouble resulted due to the faulty condition of some of the consumers' wiring, the Board of Trade officials might not look with favour on the method adopted. With regard to osmosis, Mr. Allan said that it was becoming increasingly common to make the outer core of a concentric positive. He was further of opinion that the method of localisation described would be very unsatisfactory in dry localities, especially where there is a sandy subsoil.

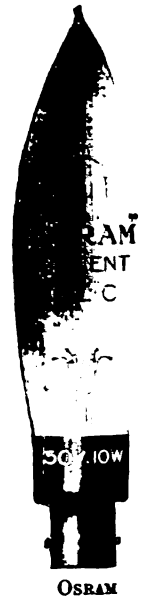
Mr. TOPPIN, in reply to Mr. McLeod and Mr. Raphael, said that he had not tried the method of localisation he described with lead-covered cable. He had, however, tried it with cable running through an iron pipe under the tramway rails, and although the tramway system was in operation at the time, he found it quite easy to differentiate between the voltage of the earth return of the tramways, which did not exceed 7 volts, and that due to the fault which approached 18 volts, and was steady. In reply to Mr. McWhirter and others, Mr. Toppin said that he had tried the method on a dry summer day with a surface of road setts, and had got a reading of 70 volts. He did not agree with Mr Morgan's criticism of the testing panel; the only accident that could happen would be if the middle wire circuit-breaker were left in whilst one of the outers was being earthed, but the breaker would come out and prevent damage.

NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Arc Lamps.

Two new flame arc lamps for alternating and direct current respectively have been placed on the British market by the Braulik Engineering Co. (8 Lambeth Hill, Queen Victoria Street, London, E.C.). The A.-C. lamp has a controlling mechanism on the Ferraris motor principle, with series and shunt wound electromagnets acting on a thin aluminium disc. The disc is geared through a train of wheels to a drum, over which are passed the chains supporting the carbons. These are balanced, and there is a positive feed. A feature of the mechanism is the way in which the parts are arranged so as to facilitate adjustment and cleaning. The shunt coil is of ample dimensions, and, it is claimed, does not get overheated. The carbons have a straight line motion, and do not swing.

MECHANISM OF D.C. LAMP.



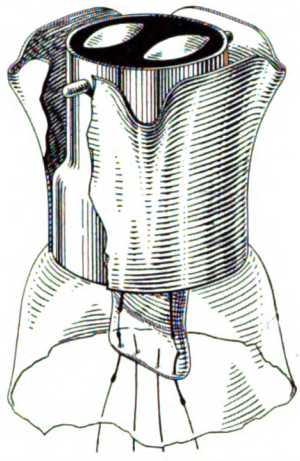
They pass through small metal plates in insulated slides let into the roof of the economiser. These slides are adjusted and fixed by screws. When the lamp is switched on, the shunt magnet induces eddy currents in the aluminium disc, and this rotates and lowers the carbons. Directly the carbons touch a current flows, and the series magnet generates eddy currents in the disc. The torque produced by the series magnet being the larger, the wheel reverses and draws the carbons up until the arc is the proper length, when the torques of the two magnets balance. As the carbons burn away, the shunt magnet becomes the stronger, and causes the disc to rotate in the feeding direction. A very sensitive and delicate adjustment of the arc is thus obtained. The blower comprises two vertical iron cores with their extremities on a level just above the carbon tips, and wound with four turns each in series with the arc. A split fire-clay economiser is supported in the brass bottom plate. A shunt cut-out is operated automatically when the carbons are fully consumed. This lamp is supplied in various sizes and for different burning hours, and burns "Excello" carbons.

The continuous-current lamp is of a novel design, with gravity feed and a clutch feeding mechanism without clockwork. As shown in the accompanying sketch, both carbons are hung from a common cross-arm sliding on a central guide rod. A chain of a special smooth link construction is attached to the cross-arm and passes over a pulley, a counter-weight moving in a tube being attached to the other end. The chain passes through an ingenious clutch, which is worked by a differential solenoid. The carbons fall together by gravity, and a device is fitted so that when the lamp is switched off, the shunt circuit is open. When the lamp is switched on, the series coil only is energised at first, and this draws the plunger up. The clutch is lifted and the arm *B* falls, bringing the shoe *C* into contact with the chain *A*. This causes the chain to be lifted, and the arc is struck. The shunt coil is now in circuit, and as the carbons burn down, the shunt coil pulls the plunger down and lowers the carbons. Ultimately, the arm *B* is let down upon the top plate of the lamp; this lifts the shoe *C* from the chain, which drops slightly. Owing to the delicate construction of the clutch and the small inertia of the moving parts, the chain is said to be dropped only about $\frac{1}{16}$ in. at each feed, so that the feed is as gradual as in a clockwork lamp. Air dash-pots are provided. Both carbons pass through holes in the roof of the economiser without any means of adjustment, as this is unnecessary in this case.

In view of the recent litigation with regard to arc lamp patents, it may be mentioned that the above lamps do not come into contact with any existing patents, the sliding collar and swinging carbon adjustment of the Bremer patent not being employed.

Incandescent Lamps.

The GENERAL ELECTRIC CO. (67 Queen Victoria Street) have recently modified the design of their Osram candle lamps, and are now able to supply the standard 10-c.p. candle-shaped lamp for 25, 33, 50, and 55 volts in bulbs 26 mm. in diameter. The new lamp is illustrated herewith; the shoulder measures 23 mm., and it is thus suitable for use in practically all designs of candle fitting. The shape and size renders it very attractive, and, being of one size, these are all interchangeable. No alteration has been made in the price.



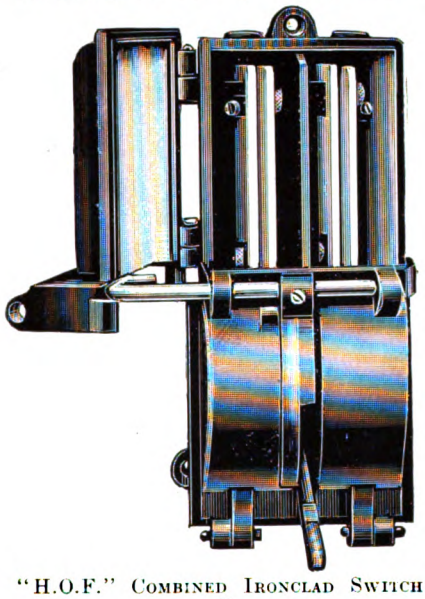
OSRAM CANDLE-LAMP.

Other new sizes of Osram lamps recently introduced include miniature lamps for use with dry batteries, for pocket-lamps, torches, hand and miners' lamps, with accumulators, &c., and a special line of lamps for motor-car head-lights, &c. The miniature lamps are listed in no less than twenty-seven styles, ranging from 0·5 to 1·8 c.p., and for voltages from 1·25 to 5·5. The new motor-car lamps have been designed after careful consideration of the requirements. The filaments are arranged to focus the light to the best advantage; all wording is stamped on the caps, and the bulbs are pipeless, so that no shadows are cast. They are made for 4, 6, 8, and 12 volts, and range from 8 to 25 c.p.

The form of rainproof lamp-cap illustrated opposite, with a sort of protecting umbrella, has been brought out by Messrs. F. WILKINS & BROTHER, LTD. (54 Whitechapel, Liverpool), with a view to allowing greater freedom in the arrangement of

Digitized by Google

lamps for outdoor illumination purposes. The hood renders it quite impossible for rain-water to enter the holder when the lamp is in an upright or upwardly inclined position, and even



WILKINS' PATENT RAINPROOF LAMP CAP.
Full Size.

when the lamp is hanging down the spouts drain the water off, so that it cannot reach the contacts.

Fittings, Switches, and Accessories.

A design of ironclad combined switch and fuse which has been put on the market during the past month by Messrs. H. O. FARRELL & Co. (Sewerby Street Electric Works, Moss Side, Manchester) is illustrated here. The most interesting feature is the substantial locking arrangement, whereby the

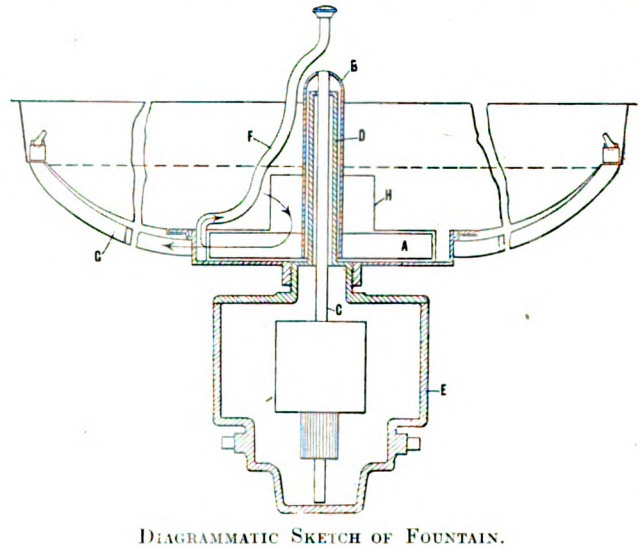
"H.O.F." COMBINED IRONCLAD SWITCH AND FUSE.

switch cannot be put on till the fuse-cover is closed and fastened; nor can the cover be opened unless the switch is off. No live metal is exposed when replacing fuses, and the whole fitting can be connected up in much less time than can separate fuses and switches.

Messrs. VERITYS, LTD. (Hardman Street, Deansgate, Manchester) are calling attention in a new list to some new and recent designs of switchgear and circuit-breakers. These include the latest form of the Crawley battery cut-in and cut-out, and a new inexpensive straight-line form of battery-regulating switch for small installations. A number of varieties of circuit-breakers are dealt with. One is a fixed handle breaker of cheap price, suitable for use in place of fuses on motor circuits and the like. There is also a cheap horizontal type for small circuits, with the advantage of a free handle; while the heavier standard edgewise breaker is constructed for all sizes, single, double, and triple pole for alternating current as well as for continuous current. These circuit-breakers can be arranged if desired in cast-iron boxes, and can be provided with magnetic blow-outs.

Heating and Cooking Apparatus.

A new electric toaster has been put on the market at a particularly low price by Messrs. F. A. WILKINSON & PARTNERS, LTD. (Harpenden, Herts). This comprises an earthenware frame in which are suspended bare wire coils by means of springs to take up the expansion of the wire when heated. The coils, which work at a bright-red heat, are protected by means of expanded metal guards, the whole being contained in a polished aluminium casing. The toaster is made for any standard voltage, and has a consumption of 700 watts. Two pieces of bread can be toasted at once, and the apparatus is instantly ready for use when switched on.



Miscellaneous.

A novel design of electrically operated fountain suitable for decorative purposes in conservatories, halls, and reception rooms, and, in the smaller sizes, for use on dining-tables or sideboards, is being introduced by the ELECTRIC FOUNTAIN CO., LTD. (188 Blythe Road, Hammersmith, London). A handsome example in bronze, with a basin 23 in. diameter, is shown in the accompanying figure, while the diagrammatic sketch below illustrates the design of the apparatus. A small centrifugal pump in the bottom of the basin is driven by a vertical motor mounted immediately underneath. The blades, *A*, of the pump are attached to a brass tube, *B*, closed at the top, where it is fixed to the spindle, *C*, of the motor. This spindle is supported in a special bearing at its foot, and the upper portion runs in a long brass tube, *D*, extending from the motor casing, *E*, to above the highest possible water level. It is thus impossible for water to reach the motor armature. The space between the spindle, *C*, and the tube, *D*, is filled with grease, and the spindle runs centrally in the tube without touching it.

BRONZE FOUNTAIN.

The water is drawn into the pump through a gauze filter, *H*, and expelled through three openings in the pump case. One opening leads to the tube *F*, supplying the central rose jet, and the other two tubes, *G*, pass under the basin up to the tube on the circumference of the basin to which are attached 18 or more jets. These latter are ball-jointed, and can be adjusted to any desired angle. The basin and tubes are of nickelled

DIAGRAMMATIC SKETCH OF FOUNTAIN.
$\frac{1}{6}$ Scale.

copper, or, in the case of the table fountains, electroplate. For conservatories, a special design with a pillar and basin of terra-cotta, marble or stone-ware is supplied. The fountains are

Digitized by Google

self-contained, portable, and require no water-pipe connections. As the same water is used over and over again, it may be perfumed or coloured. Ice may be placed in the basin, and the water may be illuminated at night.

The motor employed is of the Crypto Electrical Co.'s manufacture, and was especially designed for the purpose. In order to render it noiseless, the armature runs at the comparatively slow speed of 550 r.p.m., and has skewed slots. Motors for both A.C. and D.C. circuits are supplied, and the consumption is 60 watts for the larger fountains, and only 15 watts for the smallest table fountains. These latter have specially designed motors running at 780 r.p.m., and are supplied at present for D.C. circuits only. The table fountains are provided with two metal discs on the under-side of the base, and a special form of contact plate with contact pins pressed upwards by springs is placed under the table cloth. On account of the very low consumption, these fountains can be worked off any lighting circuit by means of an adapter or wall-plug. We inspected one at the works of the company on Monday, and can vouch for the practically silent working of the motor, which, of course, is a very important feature, especially in the case of the table fountain.

THE LATEST G.E.C. CONTROLLER

THE accompanying illustrations show the latest design of tramcar controller developed by and manufactured at the Witton Works of the General Electric Co., Ltd. In its design the aims have been kept in view equally of mechanical strength as well as accessibility and ease of dismantling and reassembly.

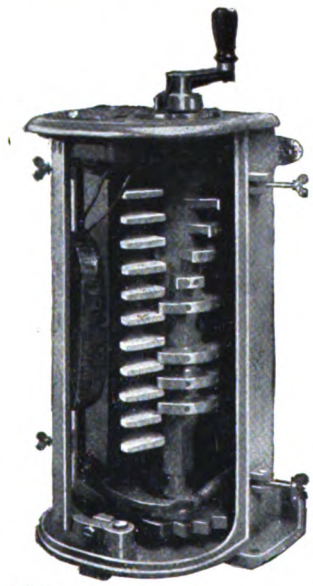


FIG. 1.—CONTROLLER IN POSITION WITH COVER REMOVED.

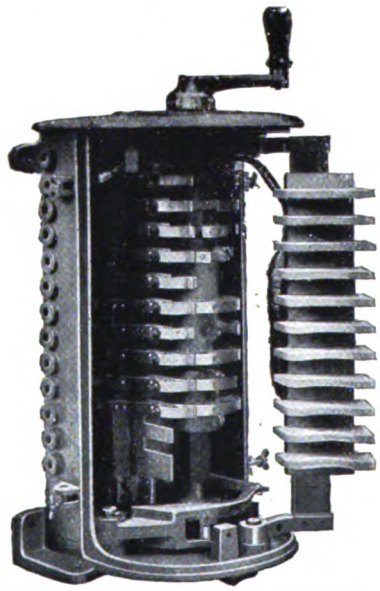

FIG. 2.—CONTROLLER WITH THE BLOW-OUT COIL AND SPARKING DIVISIONS SWUNG OUT.

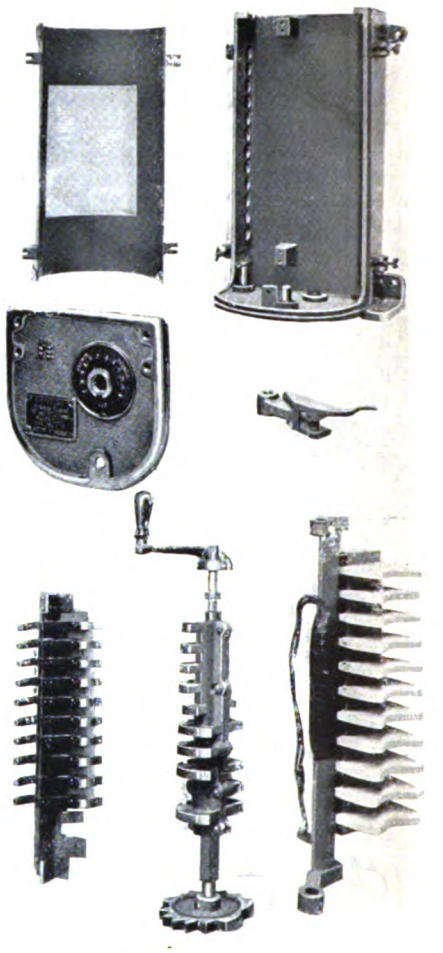

FIG. 3.—COMPONENT PARTS OF DISMANTLED CONTROLLER.

Fig. 1 shows the controller in the working position with the cover removed. Attention may be called to the large blow-out coil, the extra heavy Uralite sparking divisions, and the strong panel and cam-wheel. Fig. 2 shows the blow-out coil and sparking divisions swung clear from the controller, and leaving every part accessible. This illustration also shows the special ebonite clamps which are provided to hold the blow-out coil leads in position, which in many controllers are left unsupported and form a source of trouble. The controller can be wired up very easily, as the terminals are directly opposite the cable entry holes, and are provided with sweating sockets of the same external diameter as the cable. Fig. 3 shows the component parts of the dismantled controller.

The case is made of cast-iron, machined where necessary, and provided with a sheet-iron cover, held on with the usual fly-nut fastening. On the back of the carcass near top and bottom are two projections with V-shaped machined slots into which are fitted the ends of a square mild steel bar, micanised all over except at the extreme ends. The wrought-iron stamped finger-carriers are clamped to the micanised part. The spark shield between the finger bar and drum is also attached to the finger bar by small angle pieces clamped under the fixing screws at both ends. Each finger can be removed separately without taking the finger bar out of the controller.

The drum consists of four castings clamped to a micanised square mild steel shaft, with projections turned true in place on the shaft, to which the interchangeable copper contact segments are screwed. The two ends of the square shaft are turned round. To the lower end is keyed the substantial cam-wheel. The handle is cup-shaped to prevent rain-water from getting through the bearing of the shaft. Provision is also made to prevent the handle being taken away in any but the "off" position.

The pole-piece, which carries the blow-out coil, has fitted to its face and reaching over the whole length of the drum a heavy piece of fireproof insulating material. The sparking shields of Uralite are cemented into slots in this piece, no screws being employed, and therefore a breakdown to earth due to the splitting of one of the Uralite pieces is made practically impossible. The controller is suitable for motors up to 50 b.h.p. on 500-volt circuits, or for a maximum current of 75 amps. on lower voltages.

Electrical Exhibits at the Japan-British Exhibition.—In our article on the above in last week's ELECTRICAL ENGINEERING on page 449, the name of the firm who supplied the three-phase motor driving one of the exhibits of textile machinery was not given quite correctly. The correct title of the firm in question is Messrs. J. P. Hall & Co., Ltd. (Blackriding Iron Works, Werneth, Oldham).

Death of Mr. H. W. Cox.—On Saturday last, the death occurred of Mr. Harry W. Cox at his residence in Clapton. Mr. Cox commenced his research work with the Röntgen rays some 14 or 15 years ago, and contracted, in consequence of continual exposure to the rays, X-ray dermatitis. He made a large number of improvements in X-ray apparatus, and took out no fewer than 80 patents. Seven years ago he was obliged to retire from business, and he underwent three operations, losing successively the fingers of his left hand, his right hand, and his right arm. Ultimately the disease reached the throat, chest, and face, and a further operation was to have been performed last year, but was not attempted owing to his serious condition. Mr. Cox was most patient in his terrible sufferings. He leaves a widow and four sons. Last year the Government made a grant to Mr. Cox of £200 in recognition of his work, and Sir William Treloar was successful in raising a sum of £2,600 by public subscription. The funeral will take place to-day at Abney Park cemetery.

SERIOUS CHARGES CONCERNING THE WEST HAM ELECTRICITY UNDERTAKING

A CASE of considerable interest and importance to municipal authorities owning electricity undertakings is being heard by Mr. Justice Neville in the Chancery Division. The action, the hearing of which commenced on Tuesday, is brought by the Attorney-General, at the relation of certain large ratepayers in West Ham, principally the India Rubber, Gutta Percha and Telegraph Works Co., Ltd., of Silvertown (who have their own power house, and do not take their electricity supply from the Corporation).

Some time ago the West Ham Corporation applied to the Local Government Board for further borrowing powers for its electricity undertaking. It was then alleged by an organised opposition by certain sections of ratepayers that the Corporation were supplying power in some cases at a loss, and the Board postponed its inquiry for the production of details of these power contracts, which, however, the Corporation refused to furnish. After considerable delay, the deadlock was removed by the contracts being produced for the inspection of the Board without their being made public. In the meantime, however, the Corporation needed further capital to carry on its undertaking, and made overdrafts at the London County and Westminster Bank. It is now contended that the payment of the interest on these overdrafts is illegal, but the further serious charge is made that the Corporation, instead of investing the sinking fund for repayment of its previous loans, as it is bound to do, has been using the money set aside for this purpose as a set-off against the new capital borrowed from the bank, as already explained, without the sanction of either Parliament or the Local Government Board.

Sir Alfred Cripps, K.C., Mr. Macmorran, K.C., and Mr. Scholefield, appear for the Attorney-General, and Mr. Danckwerts, K.C., Mr. Morten, K.C., and Mr. Tomlin appear for the West Ham Corporation. The London County & Westminster Bank are also cited as defendants, and are represented by Mr. Buckmaster, K.C., and Mr. Methold.

Sir ALFRED CRIPPS, in opening the case, said the allegation was that the West Ham Corporation were illegally and improperly borrowing in respect of the electricity undertaking; the sums so borrowed had been used both for capital and revenue purposes without any authority whatsoever. The total at one time amounted to nearly £150,000. He contended that it had already been held in the Courts that overdrafts by municipal bodies upon their bankers were illegal except for mere temporary purposes. The position was aggravated by the fact that in order to get these overdrafts from the bank, the Corporation had given the security of its general borrowing powers, irrespective of the purpose to which the particular overdraft was to be applied. For instance, when the Corporation wished to borrow for the electricity undertaking, in respect of which no sanction had been received, they used the borrowing powers of the Tramways Department as security, and applied the money for electricity purposes. After mentioning incidentally that the Town Clerk, Dr. Hilleary, was also adviser to the bank, Sir Alfred contended that as the security given to the bank for the overdrafts was illegal, they could not recover any of the outstanding overdrafts against the Corporation, and further that the payments to the bank by the Corporation for interest must be refunded. The interest paid to the bank up to the present amounted to £14,000. None of the provisions for the security of the sinking fund, he continued, had ever been complied with at all. At the end of March, 1908, the sinking fund should have amounted to £90.000, but as far as he could understand not one penny of this had been invested in outside securities, and the amount had really been used as a set-off against overdrafts which had been obtained from the bank from time to time. Such methods were wholly wrong and improper, for it placed the security of a large amount of the ratepayers' money in the hands of a bank which might be jeopardised had they been unfortunate enough to select a bank less stable than the London County & Westminster Bank.

Sir Alfred Cripps then dealt with the revenue account of the electricity undertaking, and said that, from their investigation of the Corporation's books, there appeared to be a deficiency of £44,000 upon the electricity undertaking, which had never been made up, and by the system of overdrafts which had been made use of, the ratepayers were unable to ascertain that they were losing money on the electricity undertaking at all; in fact, the ratepayers did not know the real state of the electricity finances. The deficiency standing in the books had been secured by overdrafts, whereas the Corporation was under statutory obligation to pay their debts from year to year and so meet the deficiency.

Dealing in detail with the accounts of the Corporation since 1905, Sir Alfred Cripps alleged that a portion of the Consolidated Loans Fund, which ought to have been invested in outside trustee securities, had been placed in the hands of the bank as security. This amounted at one time to £82,147, and in the system of book-keeping adopted, the amount of interest which the sum should have earned had it been invested was taken into account, whereas it had not earned any interest at all.

Mr. DANCKWERTS, for the Corporation, said this was all a fairy tale of Sir Alfred Cripps' clients.

Sir ALFRED CRIPPS was still making his opening speech when we went to press.

HEAT ACCUMULATORS FOR EXHAUST STEAM PLANT

AN important case in connection with a patent covering improvements in heat accumulators for exhaust steam plant has just been decided. The patent in question is No. 22,025 of 1907, by Mr. D. B. Morison, managing director of Messrs. Richardsons, Westgarth & Co., Ltd., of Hartlepool, and relates to a method of utilising the exhaust steam from an intermittently working engine for supplying a low-pressure turbine. Excess of exhaust steam is passed automatically into a steam and water reservoir or heat accumulator, from which steam can be drawn continuously for working the low-pressure turbine when the supply of exhaust steam in insufficient. The water is withdrawn for use as boiler-feed. The claims of Mr. Morison's patent cover the use of an automatic valve to pass any excess of exhaust steam into the accumulator, and a special construction of the accumulator. After acceptance and publication of the complete specification in October, 1908, the grant of a patent was opposed by the Société d'Exploitation des Appareils Rateau, of Paris, on the ground that the invention was covered by a prior British patent, No. 3,608 of 1901, granted to Rateau. The opponents asked for the insertion in Morison's specification of a reference to this patent, which they considered to be a master patent for a heat accumulator receiving exhaust steam intermittently and delivering steam continuously to a low-pressure engine exhausting into a condenser. The Chief Examiner of the Patent Office decided to grant the patent, however, without any amendment, holding that the Rateau patent could not be considered as a master patent, and that the constructions of accumulator in the two specifications are substantially different. Further, he pointed out that the automatic valve is an essential feature of Mr. Morison's patent, and that no such device is suggested in the Rateau patent.

The Rateau Co. appealed against the decision of the Chief Examiner in so far as he did not require the insertion of a specific reference to the Rateau patent. The hearing of the appeal took place before Sir Rufus Isaacs, the Solicitor-General, on May 23rd, 1910. Mr. Morison was represented by Mr. Astbury, K.C. and Mr. Frost, and Mr. Colefax appeared for the opponents. In giving judgment, on June 29th, the Solicitor-General affirmed the Chief Examiner's decision, holding that Mr. Morison's method of automatically regulating the admission of steam to the accumulator was novel, and that no reference to the Rateau patent need be made.

NEW BOARD OF TRADE REQUIREMENTS FOR TRAMWAYS

THE revised Board of Trade memorandum regarding details of construction and equipment of Tramways and Light Railways laid on public roads, which is printed in the July circular of the Tramways and Light Railways Association, contains one or two small alterations from the memorandum previously in force. In the section on posts and brackets, it is now specified that poles supporting gas lamp brackets should be efficiently bonded to the rails. The section on cars contains the following new clause: "On lines having severe gradients and sharp curves, the use of double-deck cars may be objected to." The clause on sanding apparatus has also been extended in scope, and requires sanding appliances for each rail at both ends of the car in all cases, instead of only where considered necessary on account of the gradient. Some modifications have also been made in the requirements for detecting live trolley standards. The red lamp is to be "bridged with a suitable fuse," and it is required that the signal device should be tested at least once a week. Another addition is that a catch-rope should be attached to prevent detachable trolley-heads from falling.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 7th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

13,842/09. **Magazine Arc Lamps.** W. R. RIDINGS. In these lamps both the carbons are fed forward simultaneously by a device attached to a carrier, which is alternately raised and lowered by a single endless sprocket chain, so that it is caused to engage successively with each pair of carbons in the magazine. Three claims, eight figures.

15,961/09. **Heating Apparatus.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co., Schenectady*). Electric heating and cooking appliances in which the heating element consists of flat-tapered coils, with or without central supports, of bare wire. The specification describes the application of this construction to a toaster. Four claims, two figures.

14,010/09. **Searchlight Projectors.** SIEMENS BROTHERS & Co., F. HIRD, and G. S. GRIMSTON. These projectors have a pair of lamp barrels mounted side by side and arranged so that they can be operated independently or simultaneously. The barrels are locked together for simultaneous tipping, but provision is made for increasing the distance between the vertical axes of the barrels without interfering with the balance of the apparatus. Four claims, three figures.

17,564/09. **Rotary Converters.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co., Schenectady*). In these rotary converters the circumstances are such that the armature reaction due to the motor current predominates over that due to the continuous current taken from the commutator, so that the resultant is in such a direction that it can be utilised in an unwound commutating pole to improve commutation. Four claims, four figures.

17,711/09. **Counterweight Pendants.** S. K. THOMPSON. The flexible leads leave the ceiling-rose separately, and pass under and over separate pulleys alongside each other. A special lamp-holder is also employed with separate points of entry for the conductors, so that they are kept apart throughout. Two claims, nine figures.

22,458/09. **Metal Filament Lamps.** O. KRAUSE (Electrical Engineer to the Deutsche Gasglühlicht A.-G.). The star-shaped groups of wires forming the top and bottom supports of the various sections of the filament are mounted upon a sleeve or a pair of rings supported elastically by springs from the central spindle. Six claims, four figures.

26,444/09. **Trolley Ears.** S. W. MITCHELL and H. McP. DUDGEON. These ears have extensions at either end made of softer metal than the main central portion of the ear, and tapered away almost to a point at the end, so that a certain degree of flexibility is secured with the object of lessening the liability of the wire to tear away.

26,570/09. **Tumbler Switches with Automatic Release.** C. W. DENNY. The contact arm of the switch is held in the "on" position by a catch, but the handle or knob, when released by the hand, is returned by a spring to the off position, leaving the arm free to fly off if disengaged from the catch. The release of the catch is effected in the ordinary way by a push-button at the side of the switch base, but in case of overload it can also be released by a plunger coming up through the base of the switch and actuated by the armature of a round, flat pot-magnet compactly arranged in a sub-base upon which the switch is mounted. Six claims, ten figures.

28,452/09. **Wireless Telegraphy.** E. VON LEPEL. An arrangement for producing rapid electrical oscillations in which two oscillatory circuits closely coupled are connected in parallel with a discharge gap, the capacity of one condenser being a simple multiple of that of the other, and the two circuits being coupled up so that their phases are opposed. Seven claims, four figures.

29,481/09. **Wireless Equipment for Aeroplanes.** R. A. FESSENDEN. The "antenna" consists of two capacity areas formed of metallic foil attached to the supporting or elevating planes themselves and offering no extra resistance to flight. Five claims, two figures.

350/10. **Metal Filament Lamps.** O. KRAUSE. An alternative method of arranging the springs supporting the sleeve in lamps of the class covered by Specification No. 22,458/09 abstracted above with the object of ensuring equal amplitudes of vibration of the top and bottom supports of the filament. Two claims, one figure.

Opposition to Grant of Patents

24,590/08. **Electric Smelting.** W. PORCHERS. This patent, describing a process of treating iron ores in the electric furnace, has been granted in spite of opposition. The process was described in ELECTRICAL ENGINEERING, February 10th, 1910, p. 100.

8,875/09. **Storage Battery Plates.** G. OKILL. Opposition has been entered to the grant of this patent. The specification was abstracted in ELECTRICAL ENGINEERING, May 19th, 1910, p. 330, and describes a process of manufacturing plates of the rolled grid type.

12,966/09. **Furnace Reaction.** E. C. MARKS (*T. L. Wilson*). In consequence of opposition, this patent, described in ELECTRICAL ENGINEERING, May 26th, 1910, p. 346, has been surrendered.

14,318/09. **Cranes.** STOTHERT & PITT, and W. PITT. Opposition has been entered to the grant of this patent, which covers various mechanical details of electric cranes and transporters.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: JOHNSON & PHILLIPS, LTD., and BROCKIÉ [Magazine lamps] 15,287/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: HIGHFIELD [Installation of electrical conductors] 21,021/09; SIEMENS & HALSKE A.-G. [Rectifier] 5,917/10.

Dynamos, Motors, and Transformers: WALKER [Dynamos] 11,956/09; MAGGIORA and SINCLAIR [Motors] 17,863/09; FARREL [Power transmission] 722/10.

Electric Ignition: VAN RADEN, 29,026/09.

Heating and Cooking: CHILDS and HILL [Electric ovens] 14,548/09; ROYCE [Electric heaters] 21,564/09.

Switchgear, Fuses and Fittings: LAMKIN and NUNWICK [Lamp-holders] 14,763/09; VERITY'S, LTD. and PIPKIN [Quick break switch] 15,441/09; WEST [Quick break switch] 16,649/09; LE STEPHANO [Regulator for lamps] 19,465/09.

Telephony and Telegraphy: SHORE [Street fire alarm] 13,973/09; LAKE ("*Polyfrequenz*" *Elektricitats-Gesellschaft*) [Producing oscillations] 16,558/09; MUIRHEAD and MUIRHEAD & Co., LTD. [Telegraphy] 23,429/09; MANDERS [Production of sustained oscillations] 24,134/09.

Traction: WATKINS [Conductor-rail insulator] 21,526/09.

Miscellaneous: HOLDEN [Electric clocks] 14,873/09; BULTEAN [Combined waiter's call and dinner-table centre-piece] 14,896/09; CHETWYND, KELVIN & JAMES WHITE and CLARK [Portable magnetic compass] 16,607/09; BROWN [Burglar alarm] 26,405/08; BRICE [Dental applicator for electric massage vibrator] 27,705/09; SIEMENS & HALSKE A.-G. [Subaqueous sound producers] 4,967/10; HIBBERD [Prepayment meter] 30,093/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, Motors, &c.: SIEMENS-SCHUCKERTWERKE-GESELLSCHAFT [Motor speed control] 14,345/10; A. G. BROWN, BOVERI & CIE [A.-C. commutator machines] 1,768/10 and 14,391/10.

Telegraphy: WIDEGREN and WIDEGRIN, 13,991/10.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

16,057 of July 20th, 1896. **Electrolytic Apparatus.** C. KELLNER. Electrodes for high current densities are formed of a sheet of insulating material, with smaller sheets of woven platinum wire on each side. The two wire sheets are connected together through the centre of the insulating sheet.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, &c.: J. G. LORRAIN [Insulators] 7,238/04.

Electric Ignition: A. ECKSTEIN and H. J. COATES, 6,878/04.

Electrometallurgy, &c.: L. MOND [Electro-deposition of zinc] 5,764/01.

Heating and Cooking: H. J. DOWSING [Electric heat baths] 7,071/02.

Incandescent Lamps: W. L. VOELKER [Titanium carbide filaments] 6,149/99.

Instruments, &c.: W. COWDEROY [Maximum demand indicators] 6,242/01; A. G. BLOXAM [Meters] 6,951/03.

Switchgear, &c.: E. A. CAROLAN (*General Electric Co., Schenectady*) [Circuit breakers] 6,470/03; I. H. PARSONS [Multiple switches] 6,540/03; BRITISH THOMSON-HOUSTON Co. and E. B. WEDMORE [Motor starters] 6,635/03; ZWEIGBERCK [Controller] 6,719/03; J. H. DALE [Cluster fittings] 6,873/04; ELECTRIC & ORDNANCE ACCESSORIES Co., R. E. HALL, and J. R. GARDNER [Controller contacts] 5,782/05; E. GARSIDE [Rheostats] 6,383/05.

Telephony, &c.: SIEMENS BROTHERS & Co., LTD. [Telephone exchange system] 6,741/03.

Traction: R. A. HADFIELD [Tramway rails] 5,805/01; G. WESTINGHOUSE [Couplings for electric railway cars] 9,560/01; A. W. SULLIVAN and W. RENSHAW [Signalling air trains] 5,863/05; P. J. PRINGLE [Live-trolley indicators] 6,077/05.

Miscellaneous: J. C. VICKERY [Illuminated timepieces] 6,053/05; R. GRISSON [Aluminium cell rectifiers] 6,307/05.

Digitized by Google

LOCAL NOTES

BOURNEMOUTH: *The Tramway System.*—The Council recently decided to ask Mr. A. L. C. Fell, the Chief Officer of the L.C.C. Tramways system, to report upon the conduit system. Mr. Fell has now written that he is unable to make such a report, but that he is willing to give any information relative to the conduit system in London which the Bournemouth Council might desire. Mr. Fell's action is due to a decision of the London County Council, owing to the increasing number of requests for assistance from their various chief officers, but it is thought that Mr. Fell may be willing to give some valuable information unofficially, and he is to be asked to do this.

BRADFORD: *The "Norwich" System of Charging.*—The Electricity Committee have adopted, as an alternative charge for electricity supply, a fixed charge of 15 per cent. per annum upon the rateable value of the premises supplied, plus ½d. per unit for all energy consumed. This will include meter rents.

CHINA: *Nanking: Electric Supply.*—A British consular report states that an electric light company, with native capital, was formed in Nanking early in 1909; machinery has been secured from the United Kingdom, and is now being erected under the supervision of a British engineer. It is hoped to commence operations during the current year.

DARTMOUTH: *Street Lighting.*—The Urban Electric Supply Co. have suggested to the Council that they should increase the candle-power of the public lamps, and extend the period of the present contract. The company have been asked to instal some of the improved lights proposed, and after an inspection by the Council the matter will be further considered.

DROITWICH: *Electric Lighting.*—The Council have decided to oppose an application by a private company for an electric lighting provisional order for the town. The Council own the gas works, and two speakers frankly expressed their opposition to electric lighting on the ground that it would be detrimental to the gas undertaking.

FORMOSA: *Electric Light.*—A Consular report says that electric light was first seen in South Formosa in December, 1909, when a small power station was opened at Chikushimon, which supplies light to several neighbouring towns.

GLASGOW: *Tramways Accounts.*—The net balance on the tramways for the past year, after providing £110,688 for depreciation and £82,918 for renewals, is £53,028, against £66,275 in the previous year. In consequence of the decision of a Parliamentary Committee recently that no portion of the tramways profit can legally be applied to relief of rates, the whole of the available balance this year is transferred to the Common Good. The number of passengers carried was 222,730,571, against 221,744,569 in the previous year, and the receipts per car-mile have decreased from 10·26d. to 10·22d.

HOVE: *Electric Lighting Accounts.*—The accounts of the Electric Lighting Department to March 31st last show a debit balance of £404.

ILKESTON: *Proposed Tramway Purchase.*—The Council have been approached by financiers on the question of purchasing the municipal tramway system.

INDIA: *Electric Supply.*—According to the *Times of India*, a scheme of electric supply for Simla has been decided upon, and it is anticipated that the undertaking will be in working order by the end of next year. Distribution will be carried out by means of overhead wires at 120 volts three-phase.

ITALY: *Electric Traction.*—A British consular report states that the Italian State Railways Department have decided to extend the electrification of the Savona-San Giuseppe Railway line to Ceva, making a total length of 28 miles. The Consiglio Provinciale of Genoa has granted a 30 years' concession for the construction and working of an electric tramway from Savona to Vado. A company is about to be formed with an initial capital of about £32,000, and it is hoped that by the end of 1911 the line will be completed and ready for use.

LISKEARD: *Electric Lighting.*—The District Council have agreed to Messrs. Christie Bros. & Co. applying for an Electric Lighting Provisional Order for the rural district of Liskeard.

LIVERPOOL: *"Express" Tramcars.*—A suggestion having been made to the Tramways Committee that "Express" cars should be run on the tramways, the matter was referred to a Sub-Committee which has unanimously decided that such a scheme would be impracticable.

MAIDSTONE: *Electricity Accounts.*—The loss upon the electricity undertaking for the past year is £101, against a net profit of £1,073 in the previous year. Whilst the revenue from private consumers has increased slightly, that from public lamps and tramways has decreased.

MALDENS AND COOMBE: *Electric Supply.*—Messrs. Handcock & Dykes have been asked to prepare a report as to the advisability of applying for electric lighting powers.

MALVERN: *Maximum Demand System Abandoned.*—On the recommendation of the Electrical Engineer, it has been decided to cancel the maximum demand system, which, since the introduction of the higher candle-power metal filament lamps, has resulted in a greater percentage of the units being charged upon the higher rate. The Engineer's recommendation was for a flat rate of 6d. per unit less 5 per cent. for cash in 28 days, and increased discounts for larger consumers. The Council, however, have decided to limit the discount to 5 per cent., and not to increase it for larger consumers. This will practically mean 5 per cent. reduction to all consumers.

MANCHESTER: *Tramway Accounts.*—The tramway accounts for the past year show a net profit of £133,321. Reserve, renewals, and depreciation account is credited with £70,020, and the District Rate with £75,000. The total number of passengers carried was 159,049,096, against 155,011,884 in the previous year. The revenue per car-mile increased from 10·728d. to 10·869d.

The Mutual Telephone Co.—It may possibly be remembered that about twelve years ago negotiations were being carried on between the Manchester Corporation and the new Mutual Telephone Syndicate, by which the latter were to construct and maintain a telephone system in Manchester. The syndicate spent a considerable sum of money on the promise of support by the Corporation, but subsequently it was decided to institute a municipal service. This latter decision was never put into force, and since then constant application has been made by those who represented the Syndicate for the refunding of the expenses incurred. Some 30 firms, who were members of the Syndicate, have now presented a further memorial to the Corporation, which is supported by about 200 merchants and manufacturers of Manchester. It is alleged that the expenditure, the return of which is now claimed, was incurred upon the strength of Corporation resolutions, and that, as the negotiations fell through, the Corporation itself is liable.

MANCHURIA: *Electric Supply.*—A British Consular report from Dairen states that the present output from the electricity works there is 1,500 kw. So rapidly is the demand continuing that a further 2,000 kw. of machinery is in course of erection. The plant at Mukden is also to be further extended. At Dairen there is now a tramway system having a length of 14 miles, and an extension of 3½ miles is contemplated.

SALFORD: *Tramway Accounts.*—There was a gross profit of £90,958 on the past year's working of the tramways undertaking. After meeting payments to local authorities for running powers, interest, and sinking fund charges and repairs, the sum of £17,000 is applied to relief of rates, and £2,172 added to depreciation fund. The number of passengers carried was 45,940,775, a slight decrease compared with the previous year, although the gross receipts are slightly higher. With a view to obtaining a greater life with the rails, a trial has been made of the Sandberg type.

SHEFFIELD: *Tramway Accounts.*—After meeting capital charges, there is a net profit of £39,252 upon the tramway accounts for last year. Renewals Fund is credited with £21,600, "special purposes" with £2,000, and the General District Rate with £12,192. The net profit shows an increase of £3,546 over the previous year. The number of passengers carried was 78,620,798, compared with 76,356,031 in the previous year.

Electricity Accounts.—The accounts of the Electricity Department for the past year show a deficit of £2,035. The revenue from lighting decreased from £53,117 to £46,264, and this is attributed mainly to the great increase in the use of metal filament lamps. On the other hand, the revenue from power increased from £18,891 to £23,484. Mr. S. E. Fedden, the City Electrical Engineer, takes a hopeful view of the future. Whilst anticipating that the decrease in the sales for light will probably continue for some time, he is drawn to the conclusion that the Department is beginning to benefit by the advent of the new lamp in view of the fact that the new connections for the past year were 299 against 217 in the previous year. The sales for power show an increase of 1,500,000 units, and several electric smelting furnaces are expected to be connected up during the present year. The total costs per unit are now down to 0·57d., and, seeing that this position has been attained without the benefit of a large tramway and street lighting load, it is all the more meritorious.

SOUTHEND: *Light Railways.*—An agreement has been come to between the Light Railways Committee and the Colchester Light Railways Co. for the latter to have running powers over the Corporation's light railway between Prittlewell and Victoria corner, whilst the Corporation have similar powers over the Company's line between Prittlewell and Rochford.

SOUTHPORT: *Electricity Accounts.*—In spite of a decrease of £3,100 in revenue last year, the accounts of the electricity Department show a net profit of £1,475

STEVENAGE: *Electric Lighting.*—The Board of Trade have inquired as to what steps are being taken to put the Council's Electric Lighting Order into force. The Electric Supply Corporation have the matter in hand, and a meeting between them and Messrs. Crompton & Co. will be held in a few days. In these circumstances the Board of Trade is to be asked for an extension of time.

Digitized by Google

TORQUAY: *The Dolter System.*—The Council in Committee have decided not to give their consent to the Torquay Tramways Co. to substitute the overhead system for the Dolter surface contact system. In the event of negotiations falling through, the question of the system to be used will be referred to arbitration.

WEST HARTLEPOOL: *Purchase of Tramways.*—It is regarded as certain that the question of purchasing the Hartlepools tramways by the West Hartlepool Corporation will have to go to arbitration.

WINCHESTER: *Purchase of Supply Co.*—Arbitration proceedings in relation to the purchase of the Winchester Electric Lighting & Power Co. by the Corporation will take place in the early autumn. It is said to be the intention of the Corporation when they have acquired the undertaking to extend the limits of supply to some of the surrounding villages.

WOLVERHAMPTON: *Electricity Accounts.*—There was a gross profit of £20,060 on the past year's working of the electricity undertaking, compared with £16,892 in the previous year. After meeting interest and sinking fund charges, there is a net profit of £5,298, against £3,401. In his report Mr. C. E. C. Shawfield points out that the decrease in consumption for lighting purposes, which was very marked during the first nine months of the year, was not only arrested during the last three months, but the returns for that quarter show a marked increase over the corresponding period of the previous year. The average price for fuel was about 9d. per ton less than during the previous twelve months. The additional motor load connected during the year amounts to 900 h.p. The number of units sold was 8,289,720, against 6,555,125, and the maximum demand was 4,180 kw., against 3,660 kw.

WORCESTER: *Electric Fittings.*—The Electricity Committee recommend that the Electricity Department be allowed to act as agents for manufacturers for the sale of heating and cooking apparatus, and motors on a commission basis, but the Council is not to be liable for the price of the goods sold. Some opposition has been offered to this by the local wiring contractors, and a deputation is to wait upon the Electricity Committee before the matter is brought before the Council.

YORK: *Tramway Receipts.*—Since the opening of the electric tramways on January 20th this year, the receipts per car mile have amounted to 10·16d. On one or two special days the receipts have amounted to as much as 18·44d. per car mile. The Tramways Committee have instructed the City Surveyor and Tramways Manager to report upon any necessary extensions of the tramways.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ALDERSHOT.—Application is to be made for a loan of £2,300 for electrical purposes.

BARNET.—Tenders are invited for dynamos, motors, battery, and wiring work for the Guardians. Particulars from the Clerk, 12 High Street, Barnet, and tenders by July 26th.

HOVE.—Mains are to be extended at an estimated cost of £245.

IRELAND.—Messrs. Wilkins & Burdon, Electrical Engineers, of Dublin, have placed details of an electric lighting scheme before the Ballymoney Council.

LEITH.—The Dock Commissioners have in hand the construction of an electric power station at an estimated cost of £20,000.

LITTLEBOROUGH.—The District Council some months ago concluded negotiations with the Rochdale Corporation for a supply of electricity in bulk, the Council doing its own distribution. The cost of the scheme is put at £3,500, and a Local Government Board inquiry has been held concerning this. Mr. W. C. C. Hawtayne is Consulting Engineer to the Council.

LONDON: *Poplar.*—The Finance Committee of the L.C.C. have sanctioned a loan of £8,910 for the electricity undertaking.

PENMAENMAWR.—A loan of £550 has been sanctioned for lighting the promenade by electricity.

SEVENOAKS.—Messrs. Mordey & Dawbarn have presented a report to the Council with regard to an electric lighting scheme. The undertaking is expected to be self-supporting in the third year, and the estimates show a progressive profit up to £1,300 in the tenth year.

WALSALL.—Extensions to the Electricity Works are recommended at an estimated cost of £23,225.

YORK.—An inquiry was held last week concerning a loan of £2,475 for services, motors, and meters. Mr. R. H. Hooper, the Local Government Board Inspector, suggested that it would be well for the Corporation to avoid borrowing money for meters, and to provide the amount out of revenue. The recommendation of the Inspector on this point is to be laid before the Electric Lighting Committee.

Miscellaneous

AUSTRALIA.—The Deputy Postmaster-General at Melbourne invites tenders by August 30th for electrical sundries, insulators, wire, &c. Copies of the specifications may be seen at the Board of Trade, 73 Basinghall Street, London.

WALTHAMSTOW.—The Council require six double-deck roof covered tramcars with magneto brake equipments. Particulars from the General Manager, and tenders by July 22nd.

WIGAN.—The Guardians of the Wigan Union require electric bells and telephones at the Billinge Workhouse Infirmary. Particulars from the Master.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.W.—Cinematograph theatre, rear of 439 Battersea Park Road, S.W., for H. T. Underwood.

E.—Factory, Plaistow Wharf, Victoria Docks, for A. Lyle & Sons, Ltd.

Cinematograph theatre, St. Stephen's Road, Poplar, E., for Andrews & Peascod.

N.W.—Addition, hospital of St. John and St. Elizabeth, Lennard Place, St. Marylebone. E. Goldie, architect, 31 Upper Phillimore Place, W.

PROVINCES.

BASILDON.—Model farm (to be lighted by electricity), improvements to mansion, &c., for Captain Morrison, M.P.

BRISTOL.—Electric theatre. Architect, W. H. Watkins, 15 Clare Street, Bristol.

BURNLEY.—Reconstruction of Empire Music Hall.

BURSLEM.—Municipal buildings (£24,918). Surveyor, A. Burton, Stoke-on-Trent U.D.C.

CHELMSFORD.—The Education Committee invite alternative tenders for the lighting of the Trinity Road School by electricity and gas. Particulars from the Architect, Mr. W. H. Pertwee, The Institute, London Road, Chelmsford, and tenders by August 31st.

CROYDON.—Enlargement of Borough Hospital. Builder, T. W. Moss, Rayleigh Mission Hall, 24 Mitcham Road.

DEVONPORT.—School (£12,070). Thornley, Rook & Barrow, architects, 19 Anbyn Road, Devonport.

GLOUCESTER.—School, Deacon Street (£4,855). Byard & Sons, builders, Stroud Road, Gloucester.

KING'S HEATH.—Baths (£12,000), Institute Road. A. W. Cross, surveyor, King's Norton Urban District Council.

LINCOLN.—High School for Girls (£5,000). Builders, Wright & Son, Lincoln.

MARGATE.—Concert pavilion at Fort Undercliffe Promenade. E. A. Borg, surveyor, Margate Town Council.

NORTHAMPTON.—Theatre, for Milton, Bode & Crompton. Congregational Church (£4,281). Trustees, Abington Avenue Congregational Church.

NORWICH.—Offices, for Coleman & Co., Ltd., Westwick Street (£4,339). Architects, Morgan & Buckingham, Upper King Street, Norwich.

PLYMOUTH.—Conversion of Prince's Hall, Princess Square, into cinematograph theatre, for R. Watts.

ROCHDALE.—Extensions Technical School (£3,114). E. J. Holden, Secretary, Education Committee, Rochdale Town Council.

SHEFFIELD.—Market Place. City Architect, Sheffield City Council.

Baptist Chapel and School, Firbeck and Tadcaster Roads, for W. H. Barnes.

Theatre, Fitzalam Square, for the Cinematograph Theatres, Ltd.

Public Hall and Club, Solly Street, for P. J. Benson.

WAKEFIELD.—School, Lawefield Lane (750 pl.). Percy Glover, Secretary, Education Committee, Wakefield Town Council.

WALTON-ON-NAZE.—School (£3,974). Bell & Sons, builders, Saffron Walden.

WISHAW (Lanarkshire).—Hospital (£12,000), for the Town Council.

YORK.—Theatre, Fossgate. Architect, W. T. Whincop, York. Builders, R. Dent & Sons, York.

Admiralty Electrical Scholarship.—We understand that the Admiralty scholarship for a specially able and deserving electrical fitter apprentice in the Royal Dockyard has this year been awarded to Mr. W. H. Chatten, of Sheerness Dockyard. The scholarship is tenable for one or two years, at the discretion of the Admiralty, at the Royal Naval College, Greenwich, the holder being entitled to £40 per annum and the minimum pay of a hired electrical fitter.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

BOLTON.—The Council have accepted the tender of the Brockie-Pell Arc Lamp Co. for the supply of single-phase transformers during the next twelve months in sizes up to 15 k.v.a.

The Corporation has placed an order with Ed. Bennis & Co., Ltd., for two sprinkler stokers and self-cleaning compressed air furnaces for a new Lancashire boiler which is being erected at the Electricity Works.

LONDON: *London County Council.*—The Fire Brigade Committee report upon the use of electrically driven vehicles. Although such vehicles have for some time past been in successful operation in the principal cities of Europe, they have not yet been adopted in London. The first cost is somewhat higher than that of petrol vehicles, but the wear and tear is less, and it is expected that if new batteries are provided from time to time, the chassis and motors should last much longer than those of petrol-driven vehicles. The Committee, therefore, suggest that a tender by the "Cedes" Electric Traction, Ltd., for three electrically driven motor escape vans, including two spare wheels, should be accepted at £2,957 10s. The Austrian Daimler Motor Co., of Vienna, is to be allowed to supply the chassis fitted with wheel motors, and the Tudor Accumulator Co. will supply the batteries.

London County Council.—The following tenders have been received for the wiring of the Woolwich, Kingsland, and Lewisham fire stations. The lowest tender has been accepted in each case:—(1) *Woolwich fire station*: G. Weston & Sons, Ltd., £185; E. Newbald & Co., £186; Pinching & Walton, £192; John Barker & Co., Ltd., £203 13s.; Tredegar & Co., £270. (2) *Kingsland fire station*: W. J. Fryer & Co., £164 18s.; F. Troy & Co., £178; Alex. Hawkins & Sons, £195; John Bryden & Sons, £200; G. E. Taylor & Co., £221. (3) *Lewisham fire station*: Tilley Brothers, £160 19s.; W. Leonard & Co., £165; Pinching & Walton, £204; Whitehead Brothers, £228; G. E. Taylor & Co., £234.

MANCHESTER.—The tender of the Lorain Steel Co. has been accepted for the supply of special track-work at £6,000.

TURKEY.—The Turkish Ministry of Works have received eight tenders for the supply of electricity in the European portion of Constantinople. The firms tendering include: British Westinghouse Co.; the Union Ottoman, formed by the German Bank (Deutsche Bank) and the Berlin Tramway Co.; La Compagnie Française d'Eclairage Electrique; La Syndicate Suisse d'Electricité; Schneider & Co. (Creuzot); Ganz & Co. (Budapest), &c.

The Mirrlees Watson Co., Ltd., have recently received the following orders for steam condensing plant: From the British Thomson-Houston Co., low-level jet condensing plants, 20,000 and 15,000 lb. steam duty, for the Wath Main Colliery and Great North of Ireland Paper Mills Co. respectively; also elevated jet condensing plants, with respective steam duties of 28,500 lb. and 22,000 lb. for the Scottish Central Electric Power Co., and Lancashire & Yorkshire Railway Co., Newton Heath.—From Messrs. Willans & Robinson for Londonderry Corporation, elevated jet condensing plant, 15,300 lb. steam duty.—From Messrs. Greenwood & Batley, Ltd., for Glengarnock Iron & Steel Co., Ardeer Works, elevated jet condensing plant, 14,000 lb. steam duty.—From Messrs. Henry Tate & Sons, London, horizontal dry air pump, twin cylinder 32 in. diameter by 30 in. stroke.—From the Westburn Sugar Refinery, Ltd., Greenock, three-throw electric-driven air-pump, 26 in. diameter by 15 in. stroke; also steam-driven air-pumps for the Great Southern of Spain Railway Co., Ltd., Aquilas, per Messrs. Livesey, Son & Henderson, and for the Anglo-Chilian Nitrate & Railway Co., Ltd., London.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £56 5s. to £56 15s. per ton (last week, £57 5s. to £57 15s.).

AGENTS WANTED.—Agents are wanted for American electrical apparatus. (See an advertisement on another page.)

LIQUIDATIONS, BANKRUPTCIES, WINDINGS UP, &c.—In the Manchester County Court, on Monday, an application for the compulsory winding up of the North-Western Electricity & Power Gas Co. was heard. The company was formed in 1903, and received Parliamentary powers for the erection of a number of generating stations in Cheshire and surrounding districts. The nominal capital is £1,500,000. When the petition was called, it was announced that an agreement had been come to between the parties, it being thought that there was yet a chance of the company getting to work.

SIMPLEX BRANCH OFFICE.—Messrs. Simplex Conduits, Ltd., have opened a branch office under the charge of Mr. W. Kay, late assistant at the Manchester branch, at 12 Gascoigne Street, Boar Lane, Leeds. The new arrangement has been made with a view to accelerating delivery to the company's Yorkshire customers.

FOR SALE.—Freehold property in Wiltshire, suitable for electrical manufacturing company. (See an advertisement on another page.)

BRITISH VACUUM CLEANER PATENTS.—The British Vacuum Cleaner Co. have been successful in upholding the validity of their Booth patent, No. 17,433 of 1901, against the London and South Western Railway Co., who have been using a plant supplied by the Consolidated Pneumatic Tool Co. The case was recently heard before Mr. Justice Neville, in the Chancery Division.

"NESDRUM" WATER-TUBE BOILERS AND THE ADMIRALTY.—Messrs. Richardsons, Westgarth & Co., Ltd., of Middlesbrough, have recently received an intimation from the Secretary of the Admiralty informing them that their name has been placed on the Admiralty list of approved water-tube boiler-makers. Before coming to this decision, Messrs. Richardsons, Westgarth & Co.'s "Nesdrum" vertical-tube boilers were most carefully examined by Admiralty inspectors.

SIEMENS' ANNUAL SPORTS.—The fifth annual sports of the Siemens Institute, Stafford, take place on Saturday, August 20th. In addition to a full list of members' events, there are also included in the programme a number of open items. All athletes, especially those from other firms, would be very welcome, and can obtain further information from the General Secretary, Mr. F. E. Read, Siemens Institute, Stafford.

SMITH, MAJOR & STEVENS, LTD.—This firm of lift engineers (formerly known as Messrs. Archibald Smith & Stevens) inform us that they are building new works at Northampton, as for some time they have found their Battersea premises inadequate for their growing needs. It is hoped that the new works will be ready for occupation in the autumn. A portion of the staff and a considerable number of workmen will be retained in London.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—United River Plate Telephone Co., final dividend of 5 per cent. on the ordinary shares, making 8 per cent. for the year. Dublin United Tramways Co., half-yearly dividend to June 30th at the rate of 6 per cent. per annum. Rio Janeiro Tramway, Light & Power Co., quarterly dividend of 1¼ per cent.

Fife Tramway, Light & Power Co., interim dividend on the preference shares at the rate of 6 per cent. per annum for the June half-year. Para Tramways Co., dividend of 8 per cent. per annum for the half-year to May 31st.

Telegraph Construction & Maintenance Co., 12s. per share for the past half-year. City of London Electric Lighting Co., interim dividend of 6s. per share less tax.

City and South London Railway Co., 1¼ per cent. on the consolidated stock for June half-year.

APPOINTMENTS AND PERSONAL NOTES

Mr. H. J. Hawkins, who for three years has been Deputy Borough Electrical Engineer at Salford, has been appointed Borough Electrical Engineer there in succession to Mr. V. A. H. M'Cowan, at a salary of £500 per annum, rising by annual increments of £50 to £700. There was some opposition to the appointment of Mr. Hawkins, it being argued that there were two other candidates for the appointment who were better fitted for the post. Another amendment to the effect that Mr. Hawkins be appointed pro tem. at a salary of £400 per annum was withdrawn.

Mr. W. Frisby has been appointed Borough Electrical Engineer at Colchester at a salary of £250 per annum, rising to £300. Mr. Frisby has been in charge of the works since the resignation of Mr. Sillar a few months ago.

Mr. J. W. Saaler, of Bruce Peebles & Co., Ltd., was married on the 12th inst., at St. Margaret's Church, Westminster, to Miss Frances R. Knott, of Southsea, a reception being afterwards held at the Westminster Palace Hotel. Mr. and Mrs. Saaler sail on Saturday by the R.M.S. *Saxon* for South Africa, where Mr. Saaler is taking up an important position for his firm in Johannesburg. Mr. Saaler has been in charge of Messrs. Bruce Peebles' Manchester office for some time past, and the vacancy caused by his leaving is now filled by Mr. H. B. Tilley, who has been with the company for a number of years.

Foreman-Jointer wanted, Great Western Railway Co. (See an advertisement on another page.)

The salary of Mr. R. E. Meade, Chief Electrician to the Stafford Corporation, has been increased from £175 to £200 per annum.

Extension of Electric Traction on the London, Brighton, and South Coast Railway.—The London, Brighton, and South Coast Railway Co. have ordered from the Allgemeine Elektricitäts-Ges. of Berlin, twenty-eight further single-phase motor-carriage equipments, each consisting of four 150 h.-p. commutator motors with control gear. These equipments are for the trains for the south suburban lines. As in the case of the South London line, the line pressure is from 6,300 to 6,800 volts, and the frequency 25 cycles.

NEW COMPANIES

INTERNATIONAL "Z" ELECTRIC LAMP ASSOCIATION.—Orient House, New Broad Street, London. Capital £40,000 in £5 shares (40,000 preference). Manufacturers of incandescent lamps and other electrical apparatus, fittings, and plant. To adopt agreements with (1) Compagnie Internationale des Lamps Electriques Zircone Wolfram Société Anonyme; (2) the "Z" Electric Lamp Manufacturing Co., Ltd.; and (3) Kilburn, Brown & Co. The subscribers include Mr. W. L. Pakenham, of the "Z" Electric Lamp Manufacturing Co., who is also one of the first directors.

HELSBY WIRELESS TELEGRAPH CO., 25 Victoria Street, London, S.W. Capital £50,000. Manufacturers of telegraphic, telephone, and electrical instruments, &c.; to acquire certain patents and inventions relating to wireless telegraphy and telephony, and to adopt an agreement with the Telegraph & Telephone Instruments, Ltd. First directors are Lieut.-Col. J. Bernard, 46 Ashley Gardens, London, and Capt. C. M. Gonne, 9 Fernsham Mansions, Chelsea, S.W.

WITTON, JAMES, 71 Queen Victoria Street, London. Capital £6,000 (2,000 preference shares). Manufacturers of and dealers in electrical driving equipments for printing, textile, and paper-making machinery, &c., and to adopt agreements with the General Electric Co., Ltd., and H. V. James. The first subscribers are H. Hirst, A. H. Railing, and A. I. S. Baron, all of the General Electric Co., Ltd. The first directors are H. V. James, A. H. Railing, and A. I. S. Baron.

COMPANIES' MEETINGS AND REPORTS

ELECTRIC & GENERAL INVESTMENT CO.—At the annual meeting on Thursday Mr. J. B. Braithwaite, the Chairman, said that the balance-sheet exhibited a distinct improvement since last year. They had been able steadily to build up the contingent fund to counterbalance the depreciation on the British Electric Traction stocks which they held. In addition, there were several indications in various directions of better times to come.

ELECTRIC CONSTRUCTION CO.—The accounts for the year to May 31st show a sum of £10,811 available for distribution, including £3,687 brought forward, and after meeting debenture interest and crediting £5,000 to depreciation account. The directors recommend the dividend on the 7 per cent. cumulative preference shares, carrying forward a balance of £6,416. Regret is expressed that the results do not entirely fulfil the hopes expressed in the last report, but few orders for large installations have been placed, and the works have not been fully employed throughout the year. Meanwhile, the closest attention is being paid to expenses, and further reductions have recently been effected.

ELECTRIC TRACTION CO. OF HONG KONG.—At the annual general meeting last week the capital of this company was reduced to £81,250 by reducing the value of the £1 shares to 5s. each. This course was urged upon the shareholders as the only one by which the company could pay dividends upon their capital within a reasonable time. It was also decided to change the name of the company to the Hong Kong Tramway Co., Ltd. A further resolution was passed increasing the directors' borrowing powers by £10,000.

EDMUNDSONS' ELECTRICITY CORPORATION.—The report for the year to March 31st shows a net profit of £10,000 after meeting interest charges. To this must be added £14,800 brought forward. It is proposed to carry the total of £25,600 forward. A scheme of capital reorganisation is in hand with a view to extinguishing the arrears of dividend on the preference shares, which date back to October, 1906.

PERTH ELECTRIC TRAMWAYS.—At the annual meeting last week, reference was made to certain offers from the Town Council to purchase the undertaking. The Board have received an offer which they do not consider satisfactory, and they have refused it. There was no reason, said Mr. A. H. Stoneham, the Chairman of the Company, why they should sell unless they got a good price. The view of the Board was that if the undertaking were purchased, it should be bought by the State, and not by the Town Council. Owing to the increase in traffic, more plant and more cars were necessary, but the order for these has been delayed in view of the proposed purchase. Nevertheless, a new generating set has been ordered, and will be at work in about six months' time.

NORTH STAFFORDSHIRE TRAMWAYS CO.—At the annual meeting last week Mr. W. G. Bond stated that the company's liability to the Potteries Electric Traction Co. has been reduced to £32,329. The accounts for the past year allow of a 6 per cent. dividend on the preference shares, and 5 per cent. on the ordinary shares. A balance of £1,255 is carried forward.

MADRAS ELECTRIC SUPPLY CORPORATION.—The report for 1909 states that the construction contract is now completed, although the plant has not yet been officially taken over. Supply to the tramways was commenced in January. The company have been granted licenses to supply electricity to the Madras Port Trust and to Port St. George. In order to meet the cost of extending the mains, an issue of £100,000 6 per cent. first mortgage debentures will shortly be made.

GENERAL ELECTRIC CO.—The net trading profits for the year to March 31st were £95,461. Depreciation and debenture interest reduces this to £68,404, and, after meeting the 5 per cent. preference shares, there is a balance of £55,904. A dividend of 5 per cent. is declared on the ordinary shares and £22,000 is placed to reserve. A balance of £8,918 is carried forward. The factories at Witton, Salford, Birmingham, and London have been well employed during the year. The switchgear, arc lamp, and small motor departments have been removed from Salford to Wittor. The Peel Works at Salford are now entirely devoted to the manufacture of telephone and telegraph apparatus, a subsidiary company having been formed for this purpose.

KALGOORLIE ELECTRIC TRAMWAYS.—The revenue for last year shows a decrease of £2,100, but, owing to economy in expenses, the net profits have increased by £1,120. Mr. Norman presided at the annual meeting last week, and attributed the declining receipts to the fact that the people of Kalgoorlie are becoming more economical, and, instead of spending their money on race meetings, are using it for purchasing plots of land and building houses.

CHILI ELECTRIC TRAMWAY & LIGHT CO.—At the annual meeting last week it was stated that the tramways last year had carried 7,000,000 more passengers than in the previous year, and that the receipts had increased by about £54,000. The receipts from the light and power department also showed an increase of £34,000. After paying 5 per cent. on the preference stock, the sum of £32,000 has been placed to reserve.

Trade Openings in South Africa.—An information bureau in connection with the Commercial Intelligence Branch of the Board of Trade, is being established at Cape Town, by H.M. Trade Commissioner for South Africa. The object of the bureau is that anyone in South Africa applying, either personally or by letter, may receive the fullest information concerning goods manufactured in Great Britain and Ireland, and the Board of Trade, therefore, suggest that British manufacturers would find it useful to forward the following data, viz.: Name and address of firm; class of goods manufactured; code address and codes used; terms of payment and discounts; and name and address of South African agents, if any, together with catalogues complete (in duplicate); price lists, photographs, &c. Samples are not desired. Communications on the subject should be addressed direct to His Majesty's Trade Commissioner, P.O. Box 1,346, Cape Town.

Telegraph Traffic.—On the 4th inst. the line between Bagdad and Fao was interrupted for a short while.—On the same day the cable between Gibraltar and Tangier was restored to working order; while the cable between Zanzibar and Mombassa broke down.—On this date also the cable between Fort de France, Martinique, and Paramaribo, Dutch Guiana, was repaired by the cable steamer belonging to the Compagnie Française des Cables Télégraphiques; while the Direct Spanish Telegraph Company had trouble with the Falmouth-Bilbao cable, on which a great deal of money has already been spent.—Further, on this same day, communication between Rome and Constantinople was restored.—After an interval of three days the Zanzibar-Mombassa cable was again in working order; and on the 10th the route *via* Hanekin was at rest on Persian territory.—July 8th saw the reopening of the radio-telegraphic station at Heligoland, which was recently closed.—According to the *Tageblatt*, the new cable agreement between France and Germany provides for the laying of a cable between Brest and Emden.

The Institution of Mechanical Engineers' Summer Meeting.—The summer meeting of the Institution of Mechanical Engineers will be held jointly with the American Society of Mechanical Engineers in Birmingham from July 25th–28th, and in London on July 29th and 30th. The papers to be read in Birmingham are mainly on railway practice and working. There is, however, a paper on "High Speed Tools and Machines to Fit them," by H. I. Brackenbury. In London on July 29th the meeting will be held at Storey's Gate, St. James's Park, and the following papers have been submitted: "Electrification of Suburban Railways," by F. W. Carter; "Cost of Electrically-Propelled Suburban Trains," by H. M. Hobart; "Economies of Railway Electrification," by W. B. Potter; "Electrification of Trunk Lines," by L. R. Pomeroy; and "Electrification of Railways," by G. Westinghouse.

SUMMARY

The Leeds Corporation Bill, which authorises the adoption of the trackless trolley system, has now passed both Houses of Parliament.—Rhondda Tramways Bill was passed by a House of Lords Committee last week. (Page 472.)

The chief features of the Balsillie system of wireless telegraphy and telephony are the rotating discharger, the magnetic receiver, and a transmitting key obviating the necessity for using a change-over switch for receiving and sending. The rotating discharger gives a pure musical note, and is claimed to work successfully with high powers, while the magnetic receiver is said to be particularly reliable and constant. (Page 473.)

A Bill for rendering wireless telegraph installations compulsory on ships carrying more than 50 persons was read a first time in the House of Commons on Wednesday last. (Page 474.)

Some notes are given on the electric equipment of the new Dover–Ostend turbine steamers. (Page 474.)

At a meeting last week, the formation of an Association of Consulting Engineers was decided upon. (Page 475.)

The experimental work that has been done on the application of electricity to improving the conditions of agriculture is reviewed in a short article. (Page 475.)

A long letter from the Chairman of the Smoke Abatement League refers to our remarks on the deputation which recently waited on Mr. John Burns. (Page 476.)

Mr. W. P. Durtnall has been unsuccessful in his opposition to the grant of a patent to Messrs. C. A. Parsons, G. G. Stoney, and A. H. Law for a system of electrical marine propulsion. Mr. Durtnall claimed to have a master patent for a polyphase electrical speed reduction system for this purpose, but the Comptroller does not consider this to be the case. (Page 476.)

The following books are reviewed in this issue:—"Electricity," by H. M. Hobart; "Direct- and Alternating-current Testing," by F. Bedell and C. A. Pierce; "Principes de la Télégraphie sans Fil," by C. Tissot; "Wireless Telephones," by J. Erskine Murray; "The Indicator Handbook," by C. N. Pickworth; Vol. VI. of the Deinhardt Schlomann Series of Technical Dictionaries; "Exposition Franco-Britannique de Londres"; "Soldering, Brazing, and Jointing of Metals," by T. Bolas; "Auto-Transformer Design," by A. H. Avery. (Page 479.)

In an original communication to the Journal of the Institution of Electrical Engineers, Mr. W. Pollard Digby puts forward a method of testing feed-water, &c., by measuring its electrical resistance. (Page 467.)

A new design of motor-generator for supplying searchlights, cinematograph projectors, and other large arc lamps has been placed on the market. The current is taken from brushes displaced 90° from the ordinary brushes, which are short-circuited. The machine is

Digitized by Google

connected so that the arc current is the sum of the generator and motor currents, and the reactions between armature and field are so adjusted that a practically constant current is delivered under all conditions of the arc. (Page 479.)

THE action by the Attorney-General against the West Ham Corporation in respect of the financial management of their electricity undertaking, concluded on Tuesday, when judgment was reserved. At the close of his speech for the London County & Westminster Bank, Mr. Buckmaster, K.C., without admitting liability, agreed, on the understanding that proceedings against the Bank were withdrawn, to repay £7,000 received as interest on the alleged illegal loans. In view of this arrangement, Sir Alfred Cripps, on behalf of the Attorney-General, asked for certain declarations and an injunction against the Corporation. (Page 481.)

AMONG the specifications published by the Patent Office on Thursday last was one by Miles Walker for a method of obtaining pressure variation on the D.C. side of rotary converters by rocking the brushes.—A design of electric oven with a glass window in the inner door for enabling the contents to be inspected is patented by J. G. Childs and T. S. Hill.—A method of control for guns and turrets in which the motors are arranged in series and supplied by a constant-current generator, is covered by H. C. Leake.—Opposition has been entered to the grant of a patent to the Felten & Guilleaume Lahmeyer Werke A.-G. for a method of lengthening the life of metal filament lamps.—J. and E. Conradi have surrendered their patent for a wall-plug in consequence of opposition.—A patent by Siemens Bros. & Co. for a method of control for motor-actuated railway points expires on Sunday after a full life of 14 years. (Page 482.)

SOME particulars are given of the multiple-unit single-phase trains now in use on the New York, New Haven & Hartford Railway. (Page 482.)

MR. A. H. DYKES has called the attention of the Beckenham Council to the very poor return from their "free wiring" system.—The Incorporated Municipal Electrical Association have communicated with the various municipalities regarding electric wiring powers, and at Dundee the promotion of a Bill has been approved.—A scheme of electric tramways has been placed before the Edinburgh Council.—Mr. James Swinburne is to advise the Leicester Corporation with regard to their electricity undertakings.—Marylebone electricity accounts show a net profit of £8,482 for last year, against a loss of £930 in the previous year. Mr. Seabrook's report deals with the question of wiring.—At Poplar there was a net profit of £4,426 upon the electricity undertaking last year, and at Stepney £1,515.—The Sheffield electricity accounts for last year show a loss of over £2,000. (Page 483.)

MAINS extensions are contemplated at Dover, Walsall, Wimbledon, and Battersea, and by the Belfast Harbour Board. Loans are to be taken up at Beckenham (£6,000); Dublin Board of Guardians (£3,000); and Eccles (£3,324). Extensions of plant are proposed at Wolverhampton and Hackney. (Page 484.)

AT the Victoria Falls Power Company's meeting last week, it was stated that the use of electric power on the Rand mines had resulted in savings in works cost ranging from 6d. to 1s. per ton crushed.—At the first annual meeting of the National Telewriter Co., the opening of a West End exchange in London was mentioned, and it was also stated that difficulties in obtaining deliveries of the instruments have been overcome.—The Central London Railway Co. propose to raise £500,000 new capital.—The accounts of Messrs. Crompton & Co., Ltd., for the year to March 31st, show a loss of £23,369 after meeting depreciation, debenture interest, and repairs. (Page 487.)

PARLIAMENTARY INTELLIGENCE

THE RHONDDA TRAMWAYS IMPROVEMENTS BILL.—This Bill, which seeks powers to construct further tramways and to make street improvements in connection with them, was under consideration by a House of Lords Committee last week, and was eventually ordered to be reported for a third reading. There were only a few opponents, including the Taff Vale Railway Co., some collieries in Rhondda, and the Swansea Bay Railway Co. Mr. Robert Hammond appeared as engineer to the scheme, which presents no engineering difficulties, the extensions being mainly with a view to linking up some outlying districts, and reducing certain overcrowding which now takes place owing to the lack of building operations due to absence of communication.

TRACKLESS TROLLEY SYSTEM.—The Leeds Corporation Bill was before the Unopposed Committee of the House of Commons on Thursday, and was ordered to be returned for third reading. The main proposal of the Bill is to adopt the trackless trolley system of electric traction. In view of the experimental nature of this proposition, it has been decided, as in the case of the Bradford Bill, only to authorise one line, and, to obviate the necessity of coming to Parliament again, the Board of Trade are given powers to sanction further lines should the working of the experimental line meet with their approval. A period of 15 years for repayment of loans is allowed for both vehicles and equipments. The Bill has already passed the House of Lords.

METROPOLITAN DISTRICT RAILWAY BILL.—This Bill was passed by a House of Commons Committee last week. The main proposals are to double the portion of the company's line between the Studland Road Junction and Turnham Green, and the raising of £187,500 additional guaranteed stock. The Bill has already passed the House of Lords.

PROGRESS OF ELECTRICAL BILLS.—The Baker Street & Waterloo Railway Bill was read a third time and passed in the House of Commons on Friday.

The Wimbledon and Sutton Railway Bill was read a third time, and the London United Tramways Bill a second time, in the House of Commons on Wednesday last week.

Telegraph Traffic.—The Direct Spanish Telegraph Co. has repaired the Falmouth-Bilbao cable, reported broken in our last issue. The repair was effected on the 11th inst. On the day following, communication between Rome and Constantinople was down for a short while, and the via Hanekine route was restored. The Bagdad-Bassorah line failed on the 13th inst., but was put into working order again on the 14th.—The Siamese administration announce that the Sultanates of Kelantan, Kedah, and Perlis are now, for telegraphic purposes, incorporated in the Federated Malay States.

Continental Telephony.—In an official communication from the Post Office concerning the submarine cable, fitted with loading coils, recently laid across the English Channel (see ELECTRICAL ENGINEERING, March 17th, 1910, p. 179), it is stated that the new cable will be brought into regular use as soon as the corresponding French land lines are completed, but the tests so far made have given very satisfactory results. It is also stated that the French Government propose to lay a similar cable across the Channel. In the meantime it is proposed to use the new English cable for experiments in conversation between London and Amsterdam, and possibly Berlin and other cities in Germany.

Middleton Tramways Dispute.—At the Manchester Assizes last week, before Mr. Justice Hamilton, Messrs. G. Freeman & Sons, contractors at Hollinwood, Manchester, sued the Middleton Electric Traction Co., Ltd., for £1,699 for extra work done in carrying out a contract for the tramway company, which amounted to £38,781. It was claimed that the company's Resident Engineer gave orders for extra work to be done amounting to £6,843, all of which had been paid with the exception of the £1,699 claimed. After hearing evidence, judgment was entered for the plaintiffs. The main point for the defence was that Mr. Stephen Sellon is Chief Engineer to the company, and that the orders for extra work should have been given by him. On the other hand, a Resident Engineer was appointed, to whom, it was alleged, the plaintiffs were referred as the Engineer under the contract.

X-Ray Dermatitis.—Yet another worker with X-ray apparatus has fallen a victim to X-ray dermatitis, in the person of Mr. F. S. Pepperdene, of Wimpole Street, London, who has done much work in this direction for the City Orthopædic Hospital, London, and the Eversfield Hospital, St. Leonards-on-Sea. An endeavour is being made to raise the sum of £2,000, as in the case of the late Mr. H. W. Cox. The Rev. E. H. Leale, Vicar of St. Stephen's Church, Bexhill-on-Sea, is treasurer of the fund.

In answer to a question in the House of Commons on Monday, Mr. Asquith said that the question of granting the widow of the late Mr. H. W. Cox a pension from the Civil List would be considered if the usual particulars were furnished him.

THE BALSILLIE SYSTEM OF WIRELESS TELEGRAPHY AND TELEPHONY

WE were afforded recently an opportunity of inspecting the London wireless station of the British Radio Telegraph & Telephone Co., which is situated in London Wall Buildings, Finsbury Circus. The system developed by this company is based on the patents of Mr. J. G. Balsillie, and includes many novel features. The station itself is situated in the basement of the building, and is connected to an aerial supported about 135 ft. above the ground by three towers on the top of the building, the two outer of which are about 140 ft. apart. An equipment, taking a maximum of 2 kw. and with a range of about 250 miles over land, or 500 miles over sea, is installed; but, in accordance with the Post Office rules, the power employed is normally only ¼ kw.

The connections of both the transmitting and receiving circuits are shown in Fig. 1. A step-up transformer, *T*, supplies the

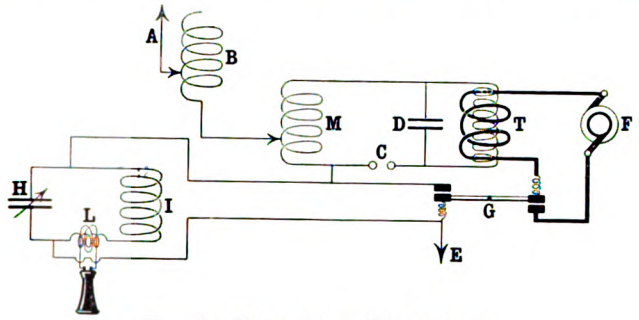

FIG. 1.—DIAGRAM OF CONNECTIONS.

oscillating circuit with alternating current at 15,000 volts, and at a frequency of from 60 to 120 cycles per second. The oscillating circuit comprises a condenser, *D*, an inductance, *M*, and

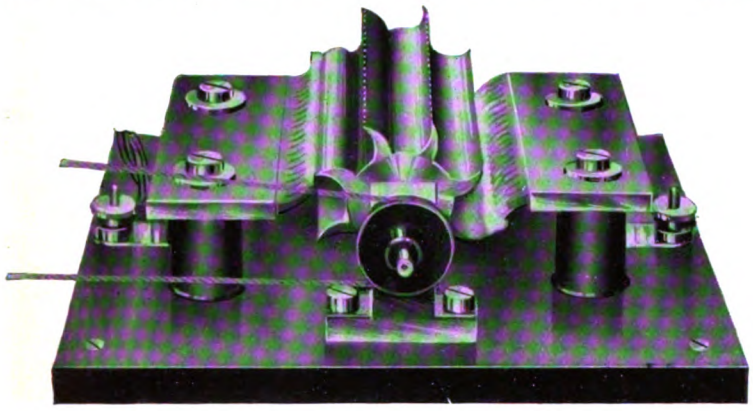

FIG. 2.—ROTARY DISCHARGER.

a special form of rotary discharger, *C*. Twelve Mosciki glass jars, with a total capacity of 0·01 mfd., are used for the condenser, and the inductance is the usual solenoid of bare copper tubing. The rotary discharger, illustrated in Fig. 2, consists of an aluminium cylinder, 5 in. long, with eight curved teeth, rotating between two fixed brass electrodes at a speed of 30 or more revs. per sec. The discharge from the condenser is thus interrupted some 240 or more times per second. By adjusting the constants of the circuit, the frequency of the oscillations is regulated so as to give a normal wave-length of 600 metres. The frequency of the discharges can be varied from 200 to 1,500 per second, and a clear musical note is obtained in the receiving telephone. It will be noted that this, the "group" frequency, is independent of the frequency of the alternating current supplied to the circuit. The effect of the curved teeth of the discharger is to produce a strong air blast across the two gaps. This cools the sparking tips, thus reducing the damping and preventing the formation of an arc. A spark length of $\frac{1}{32}$ in. is employed. The transmitting key (*G* in Fig. 1) is designed so as to obviate the necessity for using a change-over switch for receiving and transmitting. When the key is depressed to energise the transformer, the receiving circuit is short-circuited and the aerial connected direct to earth, but when the key is raised, the aerial is earthed through the receiving apparatus. It is thus possible for the operator to be interrupted while he is transmitting.

The receiving circuit, as shown in Fig. 1, consists of variable condensers, *H*, and inductances, *I*, a magnetic detector, *L*, and a device, not shown, for varying the coupling between the primary and secondary circuits. For preventing the detector from being affected by oscillations other than those which it is desired to receive, an auxiliary highly-damped oscillating circuit is provided. This is tuned to the disturbing oscillations and absorbs them. Fig. 1 shows one arrangement of the receiving apparatus, but by simple switching a number of different arrangements can be made according to the wave-length it is desired to receive. The detector, illustrated in Fig. 3, comprises a rotating armature of six cores of soft iron wire, each core being wound separately with a winding of insulated copper wire. These primary windings are connected up to the bars of a commutator on the armature shaft. A secondary coil wound over the whole armature is connected to two slip-rings, from which the induced currents are conveyed to the receiving telephone by means of suitable spring brushes. By means of similar brushes bearing on the commutator, the received oscillations are passed through two of the primary windings in series. The armature of the detector is rotated by clockwork at a very slow speed between two permanent horse-shoe magnets with their opposite poles opposed, and the magnetic flux through each of the iron cores is therefore reversed at every half revolution. The connections are so arranged that the oscillations are passed through the primary windings just at the period when the iron cores are in a neutral position between the two magnetising fluxes, and therefore in an unstable magnetic condition. The slightest current in the windings produces sudden wiping out of any residual magnetism in the cores, and this induces currents in the secondary circuit containing the telephone. It is claimed that this detector, though not quite so sensitive as the crystal and other delicate detectors now in use, is equally as sensitive as the electrolytic detector and more constant and reliable in use than any other.

For wireless telephony, a special form of rotary disc discharger has been developed. This consists of an aluminium disc about 10 in. diameter, with a large number of curved teeth on its periphery similar to those of the discharger described above. This is rotated at a speed of 12,000 r.p.m., and a group frequency giving a note of so high a pitch that it is inaudible is obtained. The speech vibrations are superposed on the waves generated by this discharger by means of a suitable microphone, and the variations in the received oscillations reproduce the speech in the receiving telephone. Mr. Balsillie informs us

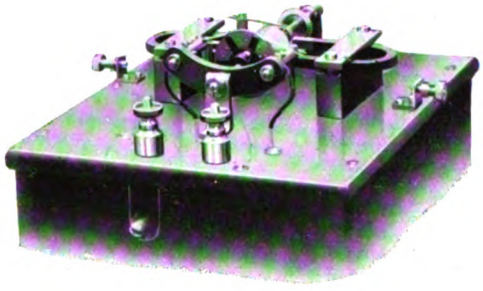

FIG. 3.—MAGNETIC DETECTOR.

that he has succeeded in transmitting music over a distance of 30 miles with this apparatus.

Prosecution under the Factory Act.—An important case came before the Houghton-le-Spring magistrates on Thursday of last week in connection with the fatality, already referred to in ELECTRICAL ENGINEERING, at the Philadelphia power station of the Newcastle Electric Supply Co. On April 15th, W. Liddle, a joiner in the employ of Messs. G. Wardroper & Sons, contractors, of Penshaw, was engaged in fitting a wooden framework round some connections which were alive at the time. He accidentally touched one with a sharp tool, and was killed instantly. The action was brought against the Supply Co. by the Director of Public Prosecutions, who summoned them for neglect to comply with the Factory and Workshops Act in that they allowed an incompetent man to undertake the work. In defence it was urged that Liddle was a competent joiner, 31 years old, who had already worked three weeks in the station. He had been fully warned of the danger of touching the connections, which were all painted yellow, with sharp tools, but he must have done so, as they were well insulated. The bench found that the man was not competent for the work he had to do, and therefore fined the company £10.

WIRELESS TELEGRAPHY AT SEA

A BILL providing for making compulsory installation of wireless telegraph equipments on vessels carrying a total number of passengers of over 50 was introduced into the House of Commons on Wednesday of last week by Sir Edward Sassoon. It is proposed to make it unlawful, under a penalty of £1,000, for a ship with more than that number of persons on board to leave port without an equipment capable of transmitting or receiving messages over a minimum range of 100 miles. Coasting steamers plying between British and Irish ports not more than 100 miles apart would be exempt. The company installing the apparatus would be required to contract to exchange messages with shore or ship stations using other systems of wireless telegraphy.

The introducer of the Bill called attention to the services which wireless communication had rendered in the preservation of life and property at sea, including the recent case of the steamship *Trieste*, and compared its compulsory adoption to the obligations in the matter of brakes and other matters imposed in the interest of public safety upon railways. The average cost of such an equipment would not exceed £200, and some compensation would doubtless be obtained in the reduction of insurance premiums. The expense of a separate operator might in small ships be avoided by giving some training to the engineer or junior engineer. In New Zealand there was power in the authorities to enforce such an obligation upon vessels: that was also the case in France, and a like proposal was before the Italian Parliament.

Mr. Gibson Bowles, in opposing the introduction of the Bill, pointed out that a great majority of large ships were already provided with wireless apparatus, but to tramp steamers the expenditure of £200 would be a serious item. Again, two operators would be required for continuous service, as it was out of the question to take the engine-room staff from their work for the purpose. He contended that shipping was already too much hampered by Board of Trade regulations, and further pointed out that it was no use installing wireless telegraphy on board ships unless they had a sufficient number of stations on land to take the messages.

The insufficiency of shore stations is certainly a fact, but contains no argument against the Bill. Increasing the demand for them cannot but tend to spur the Government Department involved to increased action in the matter. Whether ultimately the business of the marine wireless communication would remain in the hands of the Post Office we do not know, but we are sure that as easy and satisfactory a method as any of providing the many additional shore stations which would be necessary round our coast would be the installation in most, if not all, of our existing coast-guard stations of wireless telegraph apparatus for universal marine communication, thus rendering the fine body of men who tenant them of increased usefulness, instead of finding excuses for their disbandment. The initial outlay for the equipment is certainly a consideration for small ship owners, but it must be borne in mind that the increased demand for such apparatus will tend to lower its cost.

However, like many others of real utility to the nation which do not form pawns on the party chess-board, this Bill has not been afforded the facilities for it to possibly become law this session, nor has it ever been referred to a select committee. When the Bill is reintroduced we hope that the value of wireless communication, not only for calling attention to distress, but also as a means of localising position in fog, will be recognised, for the success of directive systems in this field is very marked, and we believe that already a simple "wireless compass" is on the market, which can be of great utility in the determination of a ship's position.

The Electrical Committee.—At a meeting of the Committee for the Protection of Electrical Interests held on July 6th, it was decided that the President, the Vice-President, the Hon. Treasurer, and the Hon. Secretary should form a Committee of Management entrusted with power to call meetings when necessary, and generally to prepare the business for the Committee.

ELECTRICAL EQUIPMENT OF THE NEW DOVER-OSTEND BOATS

AN account of the equipment of the two new turbine steamships *Jan Breydel* and *Pieter de Conninck*, which have recently been put into service on the Dover-Ostend route by the Belgian Government appears in *Engineering*. The two boats are of interest as being a great advance in size, comfort, and speed on the paddle-boats, which, with the earlier turbine boat *Princess Elisabeth*, they supersede, and the *Pieter de Conninck*, which started service at the end of June, has attained on her trials speeds up to 24·8 knots. The electrical generating plant consists of two 80-kw. Siemens Schuckert machines and one 20-kw. A.E.G. machine, all driven by steam turbines. The last-mentioned is for lighting when in harbour, but can be run in parallel with the others if required.

The lighting installation comprises over 300 incandescent lamps and two large searchlights. All the wiring in the stokeholds, engine spaces, and wherever it is liable to injury, is in Bergmann steel tubes, and a form of brass conduit tube is used in the saloons and cabins. Two electric motors of 34 h.p. each drive the Howden forced draught fans, and considerable use is made of electric power for ventilation about the ship, including the electric fans, supplying heated air on the "thermotank" system to the first-class saloons. An electric revolving-crane in the rear of the promenade deck serves the luggage hold; it can lift one ton, and is driven by an enclosed 8-h.p. motor for hoisting, and by a similar 2½-h.p. motor for slewing. Both operations are governed by one lever operating a controller of the tramway type. Further applications of electricity include the tell-tale signalling device in connection with the hydraulically worked water-tight doors, the side and masthead lights, and various instruments, such as tacheometers, torsiometers, &c. As has been the case for some time with all the Ostend boats, a Marconi wireless telegraph equipment is carried; electric signalling in various parts of the ship and a Lelas loud speaking telephone connects the wheelhouse with the engineer's platform. The electric equipment was supplied by the builders of the boats, the Société Anonyme John Cockerill of Seraing.

Obituary.—Members of the Electro-Harmonic Society will hear with regret of the death of Mr. A. E. Izard, who has for many years acted in the dual capacity of accompanist and musical director of the Electro-Harmonic Society's concerts. Mr. Izard had been suffering since last summer from a nervous breakdown, and had been staying at Kingsgate, near Broadstairs, for several months. In the early spring of this year, unfortunately, he had another seizure, which may be attributed to his resuming his musical duties before complete recovery and against the wish of his medical advisers. Mr. Izard became a student in the Royal Academy of Music in 1878, was appointed a sub-professor in 1883, and a full professor in 1885, and he held the latter position until his death.

Forced Ventilation for Railway Motors.—According to the *Street Railway Journal*, an interesting development of the past year is the method used for securing increased motor capacity on some of the cars of the Pennsylvania Railway Company for use in the new tunnels through Manhattan Island. Each car is equipped with two interpole motors, normally rated at 215 h.p., but which, by means of forced ventilation, are enabled to do work which would otherwise require motors rated at about 250 h.p. each. The blower outfit consists of a 1½-h.p., 2,250-r.p.m. motor, to the shaft of which is attached, at each end, a blower fan, 9 in. in diameter and 3 in. wide. Each of these fans is capable of forcing between 400 cu. ft. and 500 cu. ft. of air per min. through the motor to which it is connected. The truck on which these motors are mounted is so arranged that the blower outfit can be mounted below the bolster; 180 cars are being equipped in this way.

St. Petersburg International Electric Railway Exhibition.—The opening of the exhibition of the applications of electricity to railways which was organised to be held in St. Petersburg at the end of this year has been postponed until April 15th, 1911. The exhibits will be divided into three sections: (1) Uses of electricity on steam railways; (2) electric traction on main lines, local lines, and tramways; (3) development of water-power for electric traction purposes. Applications for space will be received up to February 15th, 1911, by the President of the Organising Committee, Mr. N. A. Sitenko, 24 Sadovia, St. Petersburg, who will also supply any information desired. The exhibition will remain open for three months, and, in view of the fact that the railway authorities of Russia are considering the conversion of several main lines to electric traction, and have already held conferences on the subject, exhibitors have good chances of doing business.

ASSOCIATION OF CONSULTING ENGINEERS

ON Wednesday of last week, a meeting, presided over by Sir William Preece, K.C.B., F.R.S., was held at Caxton Hall to consider the desirability of forming an Association of Consulting Engineers. A number of consulting engineers were present, and letters of regret from several engineers, in sympathy with the scheme, were read.

Mr. MIDGLEY TAYLOR, who presided at the opening of the meeting pending the arrival of Sir William Preece, said that the object of calling the meeting was to form an Association of Consulting Engineers. A Provisional Committee had already held a number of meetings, and the present meeting had been called to confirm, or otherwise, the action taken by the Committee. The Institution of Civil Engineers had helped the consulting engineer by forming rules for professional conduct, but the Committee considered that the Council of the Institution could not, in the very nature of things, give all the protection that was desirable for the consulting engineer. He felt that the public wanted protecting. At the present time, if municipal authorities erected works, even of large magnitude, they were not compelled to employ a qualified man to advise them, and there was nothing to prevent an absolutely unqualified man going to the particular authority, touting for the work and being employed.

Mr. JAMES SWINBURNE proposed that the Association be formed at once. There had been an idea that there was some antagonism between the proposed Association of Consulting Engineers and the Institution of Civil Engineers and other institutions. The only thing that a body like the Civil Engineers could do was to frame rules of etiquette which were very good things in themselves, but which really limited the powers of the genuine consulting engineer rather than helped him. It was, therefore, necessary that consulting engineers should work in sympathy with the Institution of Civil Engineers and other institutions, and that they should, in addition, form an association themselves, not for the purpose of technical papers but purely to guard the interests of consulting engineers as such, and of the public in so far as the latter were bound up with the interests of the consulting engineer.

The motion having been seconded by Mr. E. L. Mansergh, a general discussion took place. Mr. E. H. Stevenson wished that such an Association had been started twenty or thirty years ago, and although it might not now affect the older members like himself, it would be of very great assistance to the younger consulting engineers. Mr. Robert Hammond dwelt upon the importance of such an Association from the public point of view. Although a private company was quite at liberty to have work carried out in any way that might seem desirable, in the case of municipal work it became highly desirable that public money should be spent only under the guidance of properly qualified engineers. Mr. A. H. Preece thought that a committee might be sufficient without any formal Association. On the other hand Mr. Swinburne, Mr. Midgley Taylor, Mr. Lowcock, Mr. Hammond, and others, were in favour of an Association with a Council. Mr. W. M. Mordey saw no objection to the formation of an Association from the point of view of adding to the already long list of societies, because its functions would be very different from those of the ordinary society. There was also some discussion as to whether the term "consulting engineer" was altogether the best to be adopted in the name of the Association. Mr. Druitt Halpin thought it was undesirable, but other speakers thought it was difficult to substitute any other term. Mr. A. P. I. Cotterell asked whether the Institution of Civil Engineers were in favour of the scheme, as otherwise the Association might come in conflict with the Institution sooner or later, which would be highly undesirable. In reply to this question Mr. A. H. Dykes said that he had received a letter of a most sympathetic nature from the Secretary of the Institution of Civil Engineers. The formation of the Association was also supported briefly by Mr. Campbell Swinton, Mr. B. M. Jenkin, and Mr. H. W. Handcock.

Sir WILLIAM PREECE, who had arrived during the discussion and had taken the chair, said he was entirely in sympathy with the movement. He assured them of the sympathy of the Institution of Civil Engineers, and he was sure that the Committee of the Association would be received heartily by the Council in the discussion of any points that might arise. He then put the resolution, that the Association be formed, to the meeting, and declared it to be carried unanimously.

The following Committee was then elected, with power to add to their number: As representing *Civil Engineering:* Messrs. Latham, S. R. Lowcock, E. L. Mansergh, H. Rofe, and Midgley Taylor. *Electrical and Mechanical Engineering:* Messrs. Robert Hammond, B. M. Jenkin, W. M. Mordey, W. H. Patchell, Sir Wm. Preece, J. F. C. Snell, J. Swinburne. *Gas Engineering:* Messrs. C. Hunt, E. H. Stevenson, and Henry Woodall.

Mr. B. M. JENKIN explained the lines on which a code of rules had been drawn up by the Provisional Committee, with the object of defining what a consulting engineer was.

Amongst those who accepted the invitation to the meeting or who wrote that, whilst unable to be present, they were in sympathy with the movement, were: Messrs. J. S. Alford (Messrs. Chatterton & Alford), Walter Beer, W. I. E. Binnie (Messrs. Sir Alexander Binnie, Son & Deacon), Charles Bright, F. Broadbent (Messrs. Wilkinson & Broadbent), H. R. J. Burstall, H. R. Carr, A. P. I. Cotterell, A. T. Coode (Messrs. Coode, Son & Matthews), W. R. Cooper, Martin Deacon, A. L. Dearlove (Messrs. Clark, Forde & Taylor), R. A. Dawbarn, W. T. Douglass, A. H. Dykes, S. Moore-Ede, Tom Ekin, Percy Griffith, Robert Hammond, Robert Hammond, jun., H. W. Handcock, K. P. Hawksley (Messrs. T. & C. Hawksley), G. W. S. Hawes, H. M. Hobart, H. H. Humphreys, C. Hunt, F. H. Jones, B. M. Jenkin and J. M. Kennedy (Messrs. Kennedy & Jenkin), Baldwin Latham, E. M. Lacey, S. R. Lowcock, E. L. Mansergh and W. L. Mansergh, John May, J. C. Mellis, C. H. Merz (Messrs. Merz & McLellan), E. W. Monkhouse, William M. Mordey, W. H. Patchell, A. F. Phillips, Sir William Preece, A. H. Preece, Llewellyn Preece, Henry Rofe, Henry Rofe, jun., A. M. Sillar, A. T. Snell, J. F. C. Snell, E. J. Silcock, C. P. Sparks, E. H. Stevenson, James Swinburne, A. A. C. Swinton, Midgley Taylor (Messrs. Taylor, Son & Santo Crimp), W. C. Unwin, Robert Weekes, Henry Woodall (Messrs. Corbet Woodall & Son), A. Valon, G. A. Yourdi.

The honorary secretary of the Association is Mr. A. H. Dykes, of 1 Victoria Street, Westminster, S.W.

ELECTRICITY IN AGRICULTURE

WHILE a considerable advance has been made in recent years, particularly in Germany, in the application of electrical power for driving agricultural machinery, there have been very few workers in the direction of pursuing the investigations of the late Prof. Lemström on the actual stimulation of plant growth by means of electricity. The only large scale trials have been carried out by Mr. J. E. Newman, who, with the assistance of Sir Oliver Lodge and his son, Mr. Lionel Lodge, and the co-operation of Mr. Raymond Bomford, of Salford Priors, near Evesham, have obtained some most interesting results with various crops on Mr. Bomford's l .d. Particulars of these experiments have been published from time to time, and we have now before us the last available information in the form of an article in the *Journal of the Board of Agriculture* by Mr. J. H. Priestley, of Bristol University, who has been enabled to keep in close touch with the experiments throughout.

Evidently the chief value of the electrical treatment lies in its acceleration of the growth of the crops, although in some cases a considerable increase in the yield was noted. For instance, experiments with tomatoes, wheat, and strawberries at Evesham are recorded for 1908. In the case of the tomatoes three areas were under cultivation, two "electrified" areas with 483 and 929 plants respectively, and one "control" area with 148 plants. The two electrified areas each yielded on an average one ripe tomato for every three plants before September 24th, while the control area produced only one for every ten plants. The total yield for the season in lbs. per plant was 2·9 and 3·5 for the two electrified areas, and 2·4 for the control area. The latter was under identical conditions to the first electrified area, but the second electrified area had a better aspect, and was occasionally irrigated by the overflow from a pond. With wheat, 7·68 "electrified" acres were under cultivation, and 10·2 acres of "control" area; they produced 32·5 and 26·15 bushels per acre respectively—an increase of 24·3 per cent. for the electrified area. On the other hand, the total yield of strawberries was 9 per cent. less per acre from the electrified than from the control area, but two early pickings (June 20th and 22nd) gave 1,318 lbs. from an electrified area of 56 per cent. the size of a control area, which gave 1,876 lbs., so that there was a gain of over 25 per cent. in the early crop. The acceleration of growth thus indicated is, of course, of extremely great value to the market gardener, and off-sets any slight decrease in the total production; but Mr. Priestley points out that the decrease in the total output was probably due to an exceptional dryness of the season, which apparently resulted in the electrical treatment not working to such advantage; in the previous year the first complete picking from the two areas was 56 lbs. from the electrified and 33 lbs. only from the non-electrified, in spite of the latter being nearly double the size, and the final result was an increase of 25 per cent. per acre.

The method of "electrifying" the area is as follows:—An induction coil is employed, taking from 2 to 5 amperes at 110 volts D.-C. on the primary side, and transforming up to 100,000 volts, and a mercury vapour valve is employed as rectifier. The positive pole is connected to thick telegraph wires carried on insulators raised some 16 ft. above the ground by means of larch poles. The wire is arranged in rows 102 yards apart, and the poles in a row are 71 yards apart. The rows of wires are cross-connected by thinner galvanised iron wire 12 yards apart, and these act as discharge wires. Twenty acres are under treatment in this way, and only about 20 poles are needed to carry the wires. The tomatoes were grown in the open, and were treated, as regards the position of the wires, in precisely the same manner as the other crops.

Under glass, a single wire runs the whole length of the greenhouse, and to prevent danger of shocks the arrangements are contrived so that the wire is let down to the ground and discharged as the door is opened. In spite of the fact that a

Digitized by Google

large proportion of the discharge must be diverted by the hot-water pipes and (in the case of cucumbers) by the wires placed near the roof to support them, yet the results obtained show considerable gain due to the electrical treatment. Experiments at Bitton, near Bristol, in five cucumber houses, three of which were "electrified," showed in 1908 an average of 2,443 cucumbers per non-electrified house to 2,731 per house in the electrified houses, and the average numbers picked per house in the two sets of houses before April 29th were 278 and 449 respectively. The cucumber houses were all of the same size and aspect, and formed one continuous block.

There is still considerable doubt as to the reason for the beneficial action of the charged wires upon plant growth, and some further physiological experiments are needed to elucidate it. Mr. Priestley, in his article, reviews the question generally, but is unfortunately unable to reach any definite conclusion.

CORRESPONDENCE

To the Editor of ELECTRICAL ENGINEERING.

DEAR SIR,—May I offer a few remarks upon your somewhat unsympathetic leader of July 7th on the Memorial organised by the Smoke Abatement League which we had the honour to present to Mr. John Burns on June 29th. As your readers are men of technical knowledge and serious interest in the subject, I make no apology for troubling you with a somewhat statistical letter. I wish to lay before you such figures as are at my disposal upon the question of the proportion of domestic and factory smoke, which together constitute the great evil under which we labour. We shall all realise that the question is an extremely difficult one. It has been approached, however, in two ways.

In Manchester a number of analyses of air have been made by Professor Knecht, of the School of Technology, and by Mr. R. H. Clayton, B.Sc., President this year of the local branch of the Society of Chemical Industry. They have treated boiler soot, domestic soot, and the average air of Manchester at the centre of the city, as revealed by the deposits left on the cotton wool which purifies the air which enters the Midland Hotel.

It is, of course, known that domestic smoke is very much more deleterious than factory smoke, inasmuch as it contains a larger quantity of unburnt hydrocarbons, in the form of troublesome tarry oils and acids. It also contains much more ammonia. All this, as your readers will know, results from the imperfect combustion of the domestic grate.

We will take hydrocarbons first. These chemists found that for every 100 parts of pure carbon present, domestic smoke contained of hydrocarbons 58 parts, boiler smoke contained 3 parts, and the average Manchester air contained 27·3 parts on week days. I obtain these figures by averaging the results of a number of their experiments. A short algebraical equation gives the proportion.

Let x per cent. of the smoke in Manchester air be domestic; then $100-x$ will be factory smoke, and the equation arises:

$$58x+3\ (100-x)=(27{\cdot}3)\ 100.$$
$$58x=2430.$$
$$x=44 \text{ (about)}.$$

Treating in the same manner the figures for tarry oils only, we obtain 59 per cent. for the domestic portion, and taking ammonia only, we obtain 40·5 per cent. domestic, all on week-days. These figures, which do not claim to prove anything with perfect accuracy, leave one with the conviction that something less than half of the smoke in Manchester is due to domestic grates. Figures for Sundays were also obtained, from which it will appear that on that day, when the factories are closed, 74 per cent. of the smoke is domestic. This is what one would expect, and suits the other figures very well.

Adopting another method of investigation, the chemists of the City Corporation of Glasgow have this last winter been measuring the rate of velocity at which smoke issues from factory and from domestic chimneys, and have measured the relative size of them; and their conclusion, which has been published in expert articles in the *Glasgow Herald*, is that one factory chimney is the equivalent of 39 domestic chimneys. If we apply this to the figure which Mr. Burns obtained from official sources for his speech to us, we find that there are 1,000,000 houses in London and 35,000 factories. By far the majority of these houses are small ones, with only one fire constantly burning; if we allow, however, three smoking chimneys for every two houses, we obtain 1,500,000 domestic chimneys; and, if we multiply the 35,000 factories by 39, we obtain 1,365,000 as the equivalent figure, thus making the factory smoke and the domestic smoke in London approximately equal, with a slight advantage in favour of the factories. As factories in London do not predominate to the extent that they do in the Manchester district, these figures on the whole confirm one another. So I believe a fairly safe conclusion is that, over the large towns of England, factory smoke and domestic smoke are each about equally responsible for the evil. If we could get rid of either half England would be a different country. We could do with a little smoke without harm; it is the grand total which troubles us.

Now science has provided, as you point out, and is continuing to provide more and more successfully, means of dealing with manufacturing smoke; it is therefore legitimate to press for the use of those means on those who, in addition to their own domestic fireside, make a living by polluting the air. I hope very much that Coalite, or other smokeless fuel, will before long give us a satisfactory remedy for domestic smoke also, and I cordially support the extension of gas and electricity for domestic uses, though in approaching Mr. Burns it was proper and necessary to dwell on the legislative side only.

You appear to be sensitive upon the well-earned attacks which have been made upon the electrical power works at Chelsea and elsewhere. We should certainly be able to support your industry with greater confidence if electrical works would learn to consume their smoke as other works can.

I remain, yours truly,

JOHN W. GRAHAM

(*Chairman of the Smoke Abatement League.*)

Dalton Hall, Victoria Park, Manchester.
July 13th, 1910.

[We think that if Mr. Graham had applied his exact methods of analysis to the products of the chimneys at Lots Road, he would have found that the amount of unconsumed carbon discharged was at the time when complaints were made very much less than in the case of the average factory. It is also only fair to say that most of the trouble was due to causes which have now been modified.—Ed. E. E.]

ELECTRICAL MARINE PROPULSION

THE Comptroller-General of Patents has just issued his decision with regard to the opposition made by Mr. W. P. Durtnall to the grant of a patent to Messrs. C. A. Parsons, G. G. Stoney, and A. H. Law for an electrical system of marine propulsion. The specification in question is No. 6,177 of 1909, and an abstract appeared in ELECTRICAL ENGINEERING of April 14th, 1910, shortly after its acceptance. Mr. Durtnall opposed the patent on the ground that the invention was claimed in his patent No. 17,248 of 1905. The system consists in avoiding the use of high pressures by inter-winding the generators and motors of the equipment so that portions of the motor windings are connected with corresponding portions of the generator windings. Thus, only small differences of potential have to be dealt with in these short windings, and the insulation is easy to maintain in spite of the presence of salt and moisture in the air. For a 2,000-volt winding, for example, the pressure is generated and used in, say, twenty steps of 100 volts each. Various means of effecting this and of obtaining the required speed ratios are described in the specification.

At the hearing before the Comptroller, Mr. Durtnall conducted his case personally, while Mr. Adams appeared for the applicants. Mr. Durtnall limited his objections to certain claims of the specification covering the use of the above system of winding with high-speed engine shafts and low-speed propeller shafts, and asked for a specific reference to his patent, which he considered to be a master patent for the combination of a polyphase generator with a motor having a greater number of poles, so as to obtain an electrical speed reduction from the generator shaft to the propeller shaft. The Comptroller holds, however, that this arrangement was not new at the time of the opponent's patent, and cites patent No. 21,030/00, granted to the British Thomson-Houston Co., in which a different number of poles were used on generator and motor. He concludes that the system described in Mr. Parsons' patent is not claimed in Mr. Durtnall's previous patent, and that no reference to the latter patent nor any disclaimer need be inserted. An amendment of little importance has been made at the suggestion of the applicants, however.

Lectures on Law Relating to Engineering.—The Council of the Junior Institution of Engineers, in conjunction with the Council of the Society of Engineers, have arranged for a course of six fortnightly lectures on "The Law Relating to Engineering," to be delivered by Mr. L. W. J. Costello, the first to be given on the 10th October next.

REVIEWS OF BOOKS

Electricity. By H. M. Hobart. 207 pp. 8¼ ins. by 5¼ ins. 115 illustrations. (London: Constable & Co.) 6s.

MR. HOBART has from time to time provided several excellent works of a more or less specialised nature for the use of engineers, who have already a knowledge of the general principles upon which electrical phenomena are based, and it is with some interest that we take up a book in which his clear, logical methods and his originality are applied in providing a first introduction, or, to use his own expression, a foretaste, of the subject. His work shows that he has realised more completely than any other modern writer that the best introduction to a subject is not necessarily one which follows the course of the historical development of the science. Not only that, but he has to a more than usual extent the courage of his own convictions. The title "Electricity" is somewhat vague, and it must be understood, before we criticise any lack of completeness, that it is to "heavy" electrical engineering that the book is an introduction, not the study of the electrical aspect of physical science to what the Germans call the *Schwachstromtechnik* of the "milliampere man."

True to these principles, Mr. Hobart casts frog's legs and pith balls, beloved by the older writers, to the winds, and on page 2, instead of finding a woodcut of a gold leaf electroscope, we meet with the conventional sign resembling the commutator and brushes of a generator. The idea of conduction of currents is at once introduced, and not many pages on the reader is able to fix his ideas on something concrete in the relative conductivity and price of copper and aluminium. General considerations of energy follow, and Mr. Hobart puts in a strong plea for the use in connection with energy in all its forms of one unit, the kilowatt-hour, or, as he prefers to call it, the kelvin. A thousandth of a kelvin he wishes to call a siemens. The idea is excellent in principle, and if Mr. Hobart were the only technical writer, would work splendidly, but we are not sure that the introduction of new names of units does not sometimes tend to aggravate the confusion which it is intended to cure. At any rate, we are afraid that it will be long before we shall hear of mechanical engineers speaking of kinetic energy in "kelvins per ton." Following his sequence, the author shows how his kelvins are made of watts and hours, and the watts of volts and amperes. Having further elaborated, with illustrations always of the most practical character, the conception of the current carrying conductor, the author considers the magnetic state of affairs round it, and thus leads on to an equally logical development of the idea of the magnetic field. Moving an independent conductor in it, he generates first continuous and then alternating currents, and in connection with the latter, we are pleased to note the adoption of the term "crest value" for the maximum instantaneous current or voltage. The two succeeding chapters are headed "Inductance" and "The Magnetic Circuit," and are admirable in their clearness and straightforward treatment. The final chapter on insulating materials is of different character to the rest of the book, and is in itself a masterly little treatise on the subject, setting forth principles revealed by recent researches in a way which will be useful to many of riper experience than those to whom the book is primarily addressed.

Direct and Alternating Current Testing. By F. Bedell and C. A. Pierce. 265 pp. 9½ ins. by 6¼ ins. 115 illustrations. (London: A. Constable & Co.) 8s.

THE authors have made no attempt in this work to provide either a compendium of testing methods for the use of commercial test-room assistants or a full laboratory course for students. Although it is primarily to the latter class that the book is addressed, their object has been more to direct the reader's attention to the principles that underlie the various tests described, and to the significance of the results than to give such detailed instructions as to reduce the amount of mental effort required to little more than filling in a table and working a slide rule, as is the tendency in some laboratory manuals. The tests treated of are such as can be carried out in any ordinary college laboratory, and have been chosen with a view to illustrating principles well to the student rather than as being suited to commercial routine work. In fact, the aim has been more to enable the student to understand any form of test which he will afterwards come across in his work than to equip him with a detailed knowledge of the best methods to employ in every case.

Commencing with a general study of series, shunt, and compound generators and motors and their characteristic curves, a discussion is given of methods of measuring losses and efficiencies of continuous current machines. Alternators are then dealt with, and particular prominence is given to methods of predetermining the performance of a given machine without actually running it on load. The succeeding chapter on single-phase currents is not so much devoted to testing proper as to explanation with experimental illustration of the properties of alternating current circuits, and the same may be said to some extent of the sections on transformer and polyphase currents. Much of the matter here included usefully fills a gap between purely theoretical and purely engineering literature.

Les Oscillations Électriques: Principes de la Telegraphie sans Fil. By C. Tissot. 470 pp. 7¼ ins. by 4¾ ins. 152 illustrations. (Paris: Doin & Fils.) 5 francs.

THIS volume forms part of the *Encyclopédie Scientifique* series edited by Dr. Toulouse, and is the first of a pair on the principles of wireless telegraphy by Lieutenant Tissot, whose work in France on this subject is well known. It is devoted to the general subject of the properties and production of electric waves. The first few chapters lay the foundations of the theory of the subject, after an introduction treating generally of vibratory and periodic motion. A mathematical treatment of the properties of low-frequency alternating currents leads to a discussion of methods of producing high-frequency oscillations by means of condenser circuits, and arc as well as spark methods are gone into. Succeeding chapters deal principally from a mathematical point of view with high-frequency measurements, the propagation of impulses along wires, electric waves, radiation, and resonance. Much of this has a very practical bearing on wireless telegraphy, but the object of this volume has been rather to provide completeness in the theoretical treatment than to deal with practical applications. A useful bibliography, including works in English, French, and German, is given at the end.

Wireless Telephones. By J. Erskine Murray. 68 pp. 7¼ in. by 5 in. 17 illustrations. (London: Crosby, Lockwood & Son.) 1s. 6d.

THE book is evidently not intended for the engineer or the scientifically trained reader, but it will be of value to the general reader who is scientifically inclined and who desires to know what is being done in wireless telephony without wishing for more than a superficial knowledge of the phenomena involved. The opening pages include a lucid explanation of the propagation of sound waves, but wireless transmission is dealt with as though it were merely a matter of sending out current impulses in rapid succession along the surface of the earth; why, the uninitiated reader will ask, is it necessary to have a big thing sticking up in the air for sending current impulses along the surface of the earth?

The Indicator Handbook. Part II. By C. N. Pickworth. Fourth edition. 134 pp. 7¼ in. by 4¾ in. (Manchester: Emmott & Co.) 3s.

THE second part of Mr. Pickworth's "Indicator Handbook," of which the fourth edition has recently been published, deals

Digitized by Google

with treatment of indicator diagrams and the revealing of the information they contain, while the first part deals with the construction and use of the indicator itself. The elementary thermodynamics of the subject are studied, as well as the detection of defects in value setting, &c. Considerable space is given to gas-engine diagrams, and those from compressors, pumps, &c. The new edition before us contains some additional notes on recently introduced methods of diagram measurement, and a useful table of piston constants has been added.

The Deinhardt-Schlomann Series of Technical Dictionaries in Six Languages. Vol. VI.: Railway Rolling Stock. 796 pp. 7 ins. by 4 ins.; illustrated. (London: Constable & Co.) 10s. 6d.

THE fifth volume of this series of technical dictionaries is arranged in the same way as the previous volumes on other branches of engineering, that is to say, the ideas are arranged according to subject matter with the German, English, and French expressions on one side of the page, and the Russian, Italian, and Spanish on the other, while suitable illustrations are given in the central space. The latter part of the book consists of alphabetical indices with the Russian words separately, owing to the difference in alphabet. The majority of the volume deals with steam railway stock, and the illustrations, as elsewhere, naturally represent Continental practice entirely. The English equivalents are not always quite happy—to an English reader they would no doubt be useful in explaining the meaning of foreign terms, but a reader of one of the other five nationalities represented should not rely on the expressions given as those used in England by railway men, in spite of the fact that several prominent British railway men have allowed their names to be printed in the introduction as revisers and contributors. There is also a fairly long section on electric railway stock, which to some extent make up the deficiencies of which we complained in connection with the earlier volume on general railway matters, but is still far from complete as regards real technical terms, although many obvious expressions are laboriously translated.

Exposition Franco-Britannique de Londres, 1908. Section Française, Groupe IV. (Mécanique Générale). Rapport de M. Ch. Michel. 421 pp. 10¾ ins. by 7¼ ins. 142 illustrations. (Paris: Comite Français des Expositions a L'Etranger.)

A FITTING record of the Engineering Sections of the Franco-British Exhibition of 1908 for French readers has been provided in this work, which forms the official French report of this part of the Exhibition. All the regulations and other official documents which were addressed to exhibitors are given in full, besides a good deal of general information as to the organisation and arrangement of the exhibition. To the general reader, however, the most interesting part is the detailed description of the exhibits, which, as regards the French section, is as complete as the display itself was incomplete during most of the season. This is made all the more acceptable by the numerous and excellent illustrations provided, which include details of apparatus exhibited, as well as representations of complete stands, and views of the building. Full lists of the awards are given, and the utility of the volume is enhanced by the copious index.

Auto-Transformer Design. By A. H. Avery. 60 pp. 8½ ins. by 5½ ins. 25 illustrations. (London: E. & F. N. Spon.) 3s. 6d.

THOUGH entitled "Auto-Transformer Design," this books deals only with the particular pattern of auto-transformer which was developed a few years ago for low-voltage metal filament lamps. Indeed, the author does not appear to be aware of the fact that auto-transformers have a far wider and more important application in connection with the starting and controlling of the various types of A.-C. motors, and the wording of the introductory chapter is very misleading in this respect. Much of the general information in the book with regard to metal filament lamps and the cost of lighting is quite incorrect; nor is the author's exposition of the theory of the transformer and of the formulæ involved in its design free from mistakes. The latter portion of the book contains a certain amount of practical information on the construction of small auto-transformers.

Soldering, Brazing, and Joining of Metals. By T. Bolas. 60 pp. 7¼ in. by 4¾ in. 16 illustrations. (London: Dawbarn and Ward.) 6d.

THIS is a useful little manual giving a quantity of practical information regarding soldering, brazing, &c. The first section deals with soft soldering, and includes hints on a number of different methods, suitable for various circumstances. The next section is devoted to pipe joints and similar work, and this is followed by chapters on brazing or hard soldering and "burning" together without solder, including lead burning and oxy-acetylene autogenous welding. Only brief mention is made of electric welding.

ELECTRICAL TESTING OF WATER

AN original communication to the Journal of the Institution of Electrical Engineers by Mr. W. Pollard-Digby describes an improved apparatus for making resistance tests of water. He points out the very great effect which the presence of minute quantities of impurity has on the specific resistance of water, and suggests that resistance tests would often be found more convenient than chemical analysis. For feed-water testing the conductivity is a good indication of the degree of hardness when due to calcium carbonate, and such tests can be used for checking the operation of evaporators for make-up purposes at sea, or for the supply of distilled water for hydraulic gun mountings, and further to provide a check on the operation of surface condensers in all places. Given a boiler free from priming, a single conductivity measurement of the water passing from the condenser to the hot well will indicate the tightness of the condenser tubes. The grade of the water within boilers is subject to wide variation. The author has found the specific conductivity of water in boilers to vary from 11·1 reciprocal megohms to more than 90,000 reciprocal megohms. It therefore becomes necessary for each test for boiler priming to plot a special curve giving the conductivity of various portions of the water actually in the boiler mixed with standard distilled water. Where hard waters containing an excessive quantity of calcium and magnesium carbonates are softened by the Clark process, the conductivity tube and conductance meter can be used as a substitute for the standard soap test in defining how far the process of softening has been carried. Details of a large number of tests are given, and in a final *résumé* the author claims that the determination of the electrical conductivity of liquids offers to the engineer:—The knowledge as to when the analyst should be called in to report upon the nature and probable effect of a change in the constitution of a boiler feed water indicated by the conductivity tube and conductance meter; the knowledge as to whether condensers are leaking, and the amount of the leakage, so that the date for overhaul (immediate or remote) can be promptly settled; an exact determination of the amount of priming arising in any type of boiler under any defined conditions of load, water-level, or nature of water in the boiler; the control of oil eliminating plants, preventing the inadvertent addition of injurious constituents to the boiler feed; the control of water-softening plants.

Development of Telephone Systems.—The *Deutsche Verkehrs-Zeitung* gives the following comparative figures illustrating the development of the telephone service in the five leading countries:—Number of stations connected on January 1st, 1909: America, 2,200,000; Germany, 212,200; England, 115,000; France, 63,200; Sweden, 63,500. The corresponding figures in January, 1909, were: America, 6,620,000; Germany, 860,000; England, 590,000; France, 197,000; Sweden, 167,000. The number of calls in the year 1908 were over 11 billion in America, 1·5 billion in Germany, and 1·8 billion in England. The number of stations per 100 of the population were: America, 8·2; Germany, 1·4; England, 1·3; France, 0·5; Sweden, 3·1.

British Association.—The eightieth annual meeting of the British Association for the Advancement of Science will, as already announced in our columns, be held at Sheffield from August 31st to September 7th, under the Presidency of Prof. T. G. Bonney, F.R.S. Among the sectional Presidents are: Section A (Mathematical and Physical Science), Dr. E. W. Hobson, F.R.S., and Section G (Engineering), Prof. W. E. Dalby. The reception room at the Cutlers' Hall will be opened on Monday, August 29th, at 2 p.m. The inaugural meeting will be held on Wednesday evening, August 31st, and the concluding meeting will be held on Wednesday afternoon, September 7th. In the Engineering Section, Prof. W. E. Dalby, the President, will deliver an address, and the following Papers will be read: "The Testing of Lathe Tool Steels" and "A New Method of Testing the Cutting Quality of Files," by Prof. W. Ripper; "Experiments on Aeroplanes," by Mr. W. A. Scoble; "Accelerometers," by Mr. H. E. Wimperis; "The Optical Determination of Stress," by Prof. E. G. Coker; "The Laws of Electro-Mechanics," by Prof. S. P. Thompson, F.R.S.; "The Electrification of the Brighton Railway," by Mr. Philip Dawson; "Heat Insulation," by Mr. F. Bacon. A Report of the Gaseous Explosions Committee will be read, and joint discussions will be held with Section B on "The Chemistry of Combustion," and with Section A on "Aerial Flight." Tickets for the meeting may be obtained until August 24th at the Office of the Association, Burlington House, Piccadilly, London.

MOTOR-GENERATOR FOR PROJECTORS

AN interesting motor-generator set for supplying searchlights and other large arc lamps has been introduced by Messrs. Mather & Platt, Ltd. (Park Works, Manchester), and is illustrated in Fig. 1. There is nothing unusual about the motor, but the generator is of a special design to prevent the load current exceeding a certain predetermined limit. The connections are shown in Fig. 2. It will be seen that the motor M is in series with the arc, and that the generator G is connected across the arc, so that the total arc current is the sum of the motor and generator currents. The generator is shown diagrammatically in Fig. 3. The field system is similar to that of an ordinary two-pole generator, but the section of the

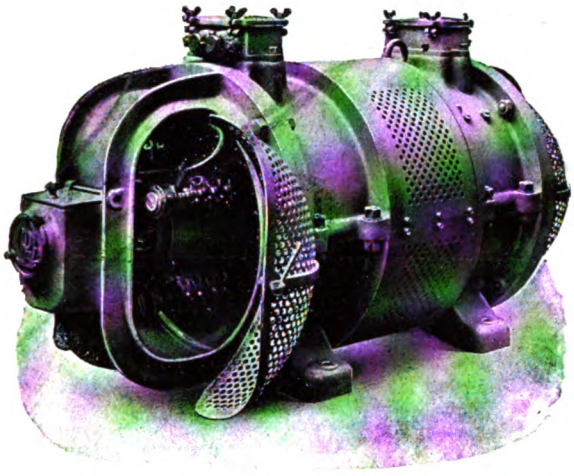

FIG. 1.—MATHER & PLATT SEARCHLIGHT MOTOR-GENERATOR.

yoke and pole cores is much reduced, while that of the pole shoes is increased. An increased air-gap is provided at D and D_1. The armature has an ordinary two-pole drum winding, but what would be the main brushes in an ordinary machine are short-circuited. These are the brushes B, B_1, which are in connection with the conductors in the neutral zones at C and C_1. Auxiliary brushes are placed on the commutator at A and A_1, and these collect current from the conductors in the gaps at D and D_1, and are connected across the arc.

When the projector is working normally, the pressure across the carbons is about 60 volts. The voltage across the motor is then 220 − 60 = 160 volts. The generator field coils, E, E_1, are connected across the 220-volt mains, and tend to set up a flux

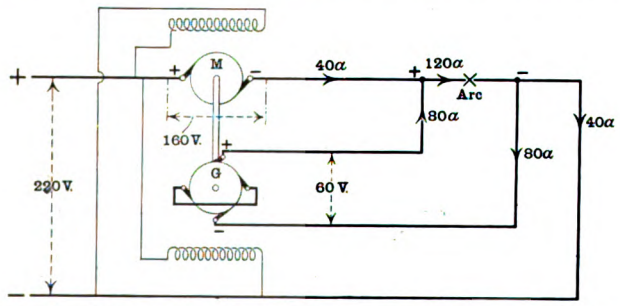

FIG. 2.—DIAGRAM OF CONNECTIONS FOR SEARCHLIGHT MOTOR-GENERATOR.

in the ordinary way. The effect of this is to cause a current to circulate in the armature between the brushes B, B_1, which produces a cross flux at right angles to the primary flux. This cross flux, which in this machine is the main working flux, induces a voltage in the armature which is a maximum between the points D and D_1, and the current due to it is collected by the brushes at A and A_1. The load current, therefore produces a magneto motive-force exactly opposing the magneto-motive force of the field windings. These two opposing magneto-motive forces are proportioned in such a manner that the resultant flux produces a current between the brushes B, B_1 sufficient to set up the main working flux.

In the case of a 120-amp. motor generator, the field winding E, E_1 has a magnetising force of 2,500 ampere-turns. The armature has a winding such that, with 80 amperes flowing through it, it produces a demagnetising effect equivalent to 1,800 ampere turns. The balance of 700 ampere turns is employed in producing a current of 40 amperes between the brushes, B, B_1. This sets up a flux which induces a pressure of 60 volts at the brushes A, A_1, and sends 80 amperes through the arc lamp carbons. For a generator output of 80 amperes, 60 volts, the motor requires an input of 40 amperes, therefore the total current in the arc lamp circuit is 80+40=120 amperes.

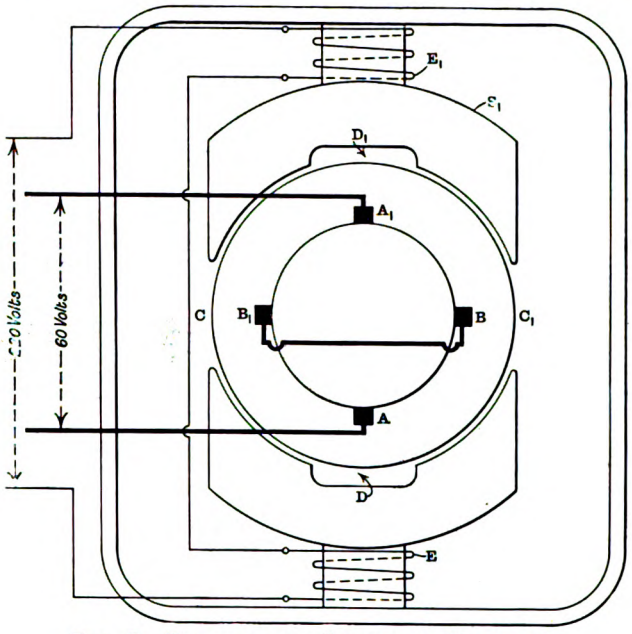

FIG. 3.—DIAGRAMMATIC SKETCH OF GENERATOR.

When the carbons are brought into contact, the resistance across the main brushes drops to zero (in actual practice to about 0·05 ohms, corresponding to 6 volts and 120 amperes). The 60 volts which were generated tend to produce a large current, but do not, for the following reason. Suppose the current increases to 111 amperes. Now, whereas the field ampere-turns remain constant, the armature reaction increases from 1,800 to 2,500 ampere-turns. The magneto-motive forces,

B. Generator Circuit.
C. Short-circuited Armature Circuit.
D. Projector Circuit (A+B).

therefore, exactly neutralise one another, leaving no flux for producing current to generate the cross-working flux. It will be seen, therefore, that the armature current cannot increase to 111 amperes, but must always be between the limits of 80 and 111 amperes, so long as the machine is under normal con-

Digitized by Google

ditions of working. Actually, with the carbons short-circuited, the current in the generator rises to 100 amperes, but at the same time the motor current falls to about 30. Therefore, the current in the arc-lamp circuit remains constant at 120 amperes. The current between the brushes B, B_1 will have fallen to about 15 amperes. The current variations under conditions of varying length of arc are clearly shown in the curves of Fig. 4.

When the arc circuit is broken, the field is then unopposed by any demagnetising effect in the armature, and tends to set up a large flux. This would produce a very large current through the brushes B, B_1, were it not limited by the saturation of the pole cores and yoke. It is not necessary that the carbons should be apart when the projector circuit is closed with a view to striking the arc. This precaution has hitherto been necessary owing to the fact that a big rush of current took place when the carbons were brought into contact, and the time during which these remained in contact, had, therefore, to be as small as possible. This end was effected by the striking mechanism of the lamp dawing the carbons apart the moment current passed through them. With this motor-generator such precautions are entirely unnecessary, and, in fact, the opposite method of working is preferable, namely, to keep the carbons closed while the generator is being run up to speed. If it is already running, and the main switch controlling the arc open, it is preferable to bring the carbons into contact before closing the main switch. The arc may then be struck by slowly moving the carbons apart. This method of working enables the carbons to reach their normal working temperature much more quickly than if they were allowed to strike by automatic striking gear. Automatic striking gear is thus unnecessary unless it is desired to switch on the projector from a distance, and the striking of the arc without the use of the automatic gear prevents the flickering which takes place when the cold carbons are brought together in the first instance.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

MOTOR STARTERS, RESISTANCES, &c.—A folder from the British Thomson-Houston Co., Rugby, calls attention to the firm's latest pattern of motor starter, with carefully graded resistances, made up of units, wound with non-rusting wire on fireproof tube encased in cement. Particulars are also given of complete tramcar resistances built up of grids of special design.

ELECTRICITY SUPPLY.—The Marylebone Electricity Department have sent us a copy of a leaflet which they are circulating among consumers calling attention to a statement of Prof. J. A. Fleming in the course of a recent lecture to the effect that with gas at 2s. 10d. per 1,000 cu. ft., and electricity at 1d. per unit, the costs of cooking by gas and by electricity come out about the same. Another circular invites consumers not to hesitate in calling in the aid of the department in cases of irregularity of working of fans, heating appliances, &c.

MOTOR STARTERS AND REGULATORS.—A very complete list of motor starting and controlling apparatus has just been issued by Messrs. Verity's, Ltd. (Hardman Street, Deansgate, Manchester). The patterns dealt with include a new double-arm starter constructed so that the contact arm falls away from the operating arm in the event of overload during starting. Attention may also be drawn to the complete range of shunt regulators for front or back of the switchboard. These have resistances of the enamel type, which can easily be renewed. Three-phase starters are also listed.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ELECTRIC TYRE PUMPS AND GAS ENGINES.—A leaflet from the Eclipse Electric Co. (77 St. John's Road, Bootle, Liverpool) describes the "Whipple" electric tyre pump, which consists of a small motor geared to a reciprocating air compressor. Another leaflet from the same firm gives prices of some small gas and oil-engine generating sets.

ARC LAMPS.—We have received from Mr. G. Braulik (8 Lambeth Hill, Queen Victoria Street, London) a leaflet giving prices of the two new flame arc lamps for A.C. and D.C. circuits respectively, which were described in ELECTRICAL ENGINEERING, July 14th, p. 462. Another leaflet gives particulars of the semi-enclosed 30-hour lamp, burning pure carbons. This works with 80 volts across the arc, and thus can be run singly on 100-110-volt circuits.

INSULATORS.—Another illustrated leaflet from Mr. G. Braulik gives prices and particulars of a number of patterns of white porcelain insulators and china wiring accessories.

FITTINGS.—A further leaflet from this firm describes a variety of cast-iron watertight electric-light fittings, including cluster fittings for street lighting, ship's fittings, hand lamps, and some special designs for high candle-power lamps for yards, railway sidings, &c.

PORTABLE AIR COMPRESSORS.—A leaflet from the A. E. G. Electric Co., Ltd., contains an illustration of a compact two-cylinder motor-driven air-cooled compressor, specially adapted for the blowing out of dynamos, motors, and various machinery installed in situations where loose matter may be drawn into the machine, such as in rope factories, flour mills, spinning mills and weaving sheds, cement factories, &c.

ELECTRO-MEDICAL APPARATUS.—Three new illustrated pamphlets have been issued by Messrs. Siemens Bros. & Co. (Caxton House, Westminster, London, S.W.). The first is a booklet produced for the forthcoming British Medical Association Annual Exhibition in London, and contains brief interesting descriptions of X-ray and other electro-medical apparatus, including recording clinical thermometers, light baths, high-frequency apparatus, and ozone generating plant. The second pamphlet is a supplement dealing with X-ray tubes of various patterns, including heavy current tubes for instantaneous radiography, with extra-thick anticathodes and water-cooling and special tubes for radiotherapy or the treatment of skin diseases with X-rays. Regenerators, regulators, and valve tubes are also listed. The third pamphlet gives for the first time a description and prices of the various radium salts, and of the tubes and other devices employed in its uses for medical purposes. The radium is that supplied by the Banque du Radium, Paris, for which Messrs. Siemens Bros. & Co. are the sole agents in this country. The last section of the pamphlet describes the radio-active earths and is based on the latest researches.

ARC LAMPS.—The Union Electric Co., Ltd. (Park Street, Southwark, London, S.E.) have issued a new list relating to the well-known "Excello" flame arc lamps, including special patterns fitted with self-contained automatic cut-outs and compensating resistances, so that if one lamp in a circuit fails the others will continue burning. Some new reflectors and covers are illustrated. Another leaflet gives particulars and prices of the "Kino" cinematograph lamp for currents up to 30 amps. This is a hand-regulated lamp with constant position of the arc, and particularly simple regulation from the back of the lamp.

THREE-PHASE MOTOR STARTERS.—A list dealing with the various patterns of the "Fortiter" three-phase motor starters has been issued by the Union Electric Co., Ltd. (Park Street, Southwark, London, S.E.). Among the new designs illustrated is a compact star-mesh switch for starting motors with short-circuited rotors. These are supplied in two sizes for motors up to 10 and 20 h.p. respectively. Resistance starters for slip-ring motors, with and without oil cooling, and others with water-cooled, oil-immersed resistances are listed, as well as small open-type starters and liquid starters. Auto-compensator starters for motors with short-circuited rotors are also listed.

SMOKE ABATEMENT.—Several leaflets are to hand from Smoke Consumption, Ltd. (120 Fenchurch Street, London, E.C.), who own the Cowper-Coles' patents for smokeless combustion. One leaflet describes the "Caloriser," which consists of a lining of special tiles in the boiler flue immediately behind the fire bridge. These tiles do not abstract the draught, but become incandescent and prevent the plates from reducing the temperature of the gases until complete combustion of all the carbons and hydro-carbons. Another device to reduce the production of smoke is the "Auto-Air Regulator," which automatically admits the varying quantity of air required during the periods between stoking.

BALL BEARINGS.—A catalogue from the Skefko Ball Bearing Co., Ltd. (Carlton House, Lower Regent Street, London, S.W.), gives particulars and standard sizes of the "Skefko" self-aligning ball bearings, the invention of a Swedish engineer, Mr. Sven Wingquist. The construction and application of these bearings are clearly described and illustrated by a number of drawings and photographs. They are claimed to allow of deflection of the shaft without injury and to withstand axial as well as radial loads.

CONTINUOUS-CURRENT MOTORS.—A pamphlet from Messrs. T. W. Broadbent, Ltd. (Victoria Electrical Works, Huddersfield), describes this firm's latest series of encased motors of the protected and ventilated type, in sizes from 2 to 160 b.h.p.

Industries and Commerce of Leeds.—The first issue of a new annual publication, to be known as the "Commercial Year-Book of the Leeds Chamber of Commerce," has been published by Bemrose & Sons, Ltd. It consists of a brief review of the industries and commerce of the city of Leeds, information as to the regulations of Foreign and Colonial Governments in relation to British merchants doing business in their territories, and other information of a commercial nature. Brief particulars are given in subsections of nearly one hundred branches of engineering. In a section on electric power it is stated that the aggregate capacity of the motors connected to the city mains amounts to over 12,000 h.p., while the units sold for power and heating alone during the year ending March 31st, 1909, were over six million, exclusive of the energy for the tramways. Brief reference is also made to the supply of electricity outside the city boundaries by the Yorkshire Electric Power Co., who include a number of municipalities, large works, collieries, textile mills, and a calcium carbide factory, among their consumers. The greater part of the publication consists of a comprehensive trade index of the firms in Leeds and the surrounding district.

SERIOUS CHARGES CONCERNING THE WEST HAM ELECTRICITY UNDERTAKING

THE action by the Attorney-General, at the relation of certain large ratepayers in West Ham, principally the India Rubber, Gutta Percha & Telegraph Works Co., Ltd., of Silvertown, against the West Ham Corporation, was concluded before Mr. Justice Neville in the Chancery Division on Tuesday. The general charge against the Corporation is that monies have been borrowed in the form of overdrafts from the London County & Westminster Bank in respect of the electricity undertaking for which the sanction of the Local Government Board had not been obtained, and that consequently the interest paid to the Bank, amounting to £14,000, is illegal, and must be repaid. A further charge is made that deficits upon the electricity undertaking have been carried forward from year to year, instead of being met out of the current rate, as provided for by the Acts of Parliament relating to Municipal Government, and also that proper provision has not been made for sinking fund in repayment of previous loans. The action started on Tuesday last week, and has been continued daily since. In our last issue we dealt with Sir Alfred Cripps' opening speech on behalf of the Attorney-General.

On Wednesday, July 13th, Sir Alfred Cripps continued his opening statement and read certain correspondence, which he said demonstrated that the Bank, who are cited as defendants to the action, were fully aware that the Local Government Board had not sanctioned the loans in respect of which they were allowing overdrafts.

On the question of the Consolidated Loans Fund, referred to earlier in the opening statement, Mr. Justice Neville said the real question was whether the loan was authorised. The Corporation had power to borrow from their Consolidated Loans Fund for temporary purposes, and the policy of allowing the quarterly payments to this fund to be set off against the overdraft by the Bank would be legitimate.

Sir Alfred Cripps pointed out that there was an uninvested amount standing to the credit of the Consolidated Loans Fund which ought to have been invested in outside trustee stock. It was in this connection that Mr. Patterson, the West Ham Treasurer, was also cited as defendant, because he was trustee for the ratepayers' money in respect of the repayments, and therefore could not plead the orders of the Corporation in regard to the manner of dealing with the sinking fund. The Attorney-General might have to consider later on whether he should endeavour to make individual persons liable in respect of the interest paid on these illegal loans.

Mr. L. Keen, a chartered accountant, was then called, and spoke to having investigated the books of the Corporation up to the year ending March 31st, 1908, at which period the electricity capital account was overdrawn to the extent of £53,488, and the revenue account to the extent of £43,863. As the plaintiffs' pleadings referred only to the three years to March 31st, 1908, he had been refused access to any of the books since then. He said that the sum of £79,667 standing in the books as "cash in bankers' hands" was really a portion of the Consolidated Loans Fund, which was being set off against the overdrafts.

On Friday, Mr. Danckwerts opened the case for the Corporation, and maintained that the policy pursued was a perfectly legal one. There was no permanent borrowing from the Bank, but merely an arrangement for the Bank to provide the Corporation with funds temporarily. The position in which the Corporation had been placed financially was largely due to the action of the Local Government Board in delaying sanction to loans which had been applied for, and the West Ham Corporation were not alone in spending money by means of overdrafts before actual sanctions were received. This was constantly being done by other Corporations throughout the country. There was no suggestion that the accounts of the Corporation were not in perfect order.

Mr. Patterson, the Borough Treasurer at West Ham, was then called, and said that the Corporation had been compelled to borrow money by means of overdrafts to meet their ordinary debts. At the present time, however, the Corporation's account with the Bank showed a credit of £58,803. The Local Government Board was largely the cause of the present position. In January, 1906, a loan of £218,000 was applied for in respect of the new station at Canning Town, but this was not granted until April, 1908. The loan asked for in 1906 included certain expenditure in respect of the transfer from the old Abbey Mills power station, amounting to £11,058, but the Local Government Board refused to grant this, holding that the amount was really in respect of superseded works which ought to have been met out of the revenue from the Abbey Mills station. This amount had eventually to be made up out of the district rate.

Throughout the case an enormous number of figures have been given on both sides, having nothing to do with the electricity accounts, in direct conflict with each other, and more than once the Judge himself has complained of his inability to follow them. Consequently Mr. Patterson was asked to keep to general principles, as all the details will have to be gone into by an inquiry should the case go against the Corporation. During the case for the defence considerable use was made of the figures relating to the position of the West Ham finances since March 31st, 1908, access to which has been denied to the plaintiffs. Consequently further confusion was caused, and ultimately Mr. Justice Neville said that he would adjourn the case if necessary for the plaintiffs to have access to these later figures.

On Monday Mr. Buckmaster addressed the Court on behalf of the London County & Westminster Bank. His argument was that the Bank only had one account with the Corporation, and lent money on the representation that the Corporation had borrowing powers to the amount required, irrespective of the use to which the Corporation applied the money afterwards. There was no denial that the Corporation had actually, at the time the overdrafts were made good, unexhausted borrowing powers to the extent of £200,000. The suggestion that the Bank were aware of the particular uses to which the Corporation intended to put the money was an impossible one, because the additional entries in the pass-book, which certainly did indicate the directions in which the money had been applied, were made by the Corporation officials themselves after the money was in their hands. The correspondence between the Bank and the Corporation demonstrated that the loans were for temporary puposes pending the floating of a permanent loan when the condition of the money market improved. It was quite true that these temporary loans extended over a long period, but nevertheless they were six-monthly loans renewed from time to time. Further, at the date the action was brought, there was no overdraft from the Bank, but the Corporation's account with the Bank was actually in credit to the extent of £4,800.

In his reply on behalf of the Attorney-General, Sir Alfred Cripps repeated most of the arguments which he made in his opening speech, and asserted that the letters between the Corporation and the Bank clearly indicated that it was the intention of the Corporation to use the monies for their various undertakings, in respect of which they had no borrowing powers. It was a wholly unjustified thing to deal with current expenses by overdrafts, except under very exceptional circumstances, which could not be held to apply in this case, as the use of borrowed money at West Ham had been part of a regular system. In his opinion the Bank really wanted this business, and he quoted the case of another Corporation, who refused to place their account with a Bank who were not ready to grant overdrafts. So long as Banks were allowed to do this without being liable, so long would these irregular methods go on, and it was necessary to stop them. Apparently the only defence the Bank had was that they were granting temporary loans, and not permanent loans. But it was quite clear that the loan was not within the limits of the Corporation borrowing powers in relation to the undertakings for which the money was used, neither was it required for matters requiring immediate settlement.

At this point in Mr. Cripps' speech a short adjournment took place in order to see whether it was not possible for an agreement to be come to with the Bank. The following arrangement was eventually come to on the understanding that proceedings against the Bank were stayed. The Bank is to repay to the Corporation the sum of £7,000 in respect of sums received by them for interest on overdrafts, and also to pay certain costs.

Mr. Morten, K.C., on behalf of the Corporation, asked for an adjournment in order to reconsider their position in consequence of this agreement. He did not know whether the Corporation were in a position to accept repayment of the money, because the arrangement was based upon an assumed illegality.

Mr. Justice Neville thought this point was met by altering the agreement to repay, in such a way that the Bank would be willing to repay the £7,000 on demand.

Sir Alfred Cripps said he did not now think that an inquiry would be necessary, but he asked for declarations from the Court that the payments made in the nature of interest on illegal overdrafts were wrong, and a further declaration stating that the manner in which the Corporation had dealt with their Consolidated Loans Fund was illegal. He further asked for an injunction to restrain the Corporation from paying back the unpaid amounts of the overdrafts, but this point was quickly met by the announcement on behalf of the Corporation, as has already been stated previously, that at the present time no monies are owing to the Bank by the Corporation.

Judgment was reserved.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 14th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

11,956/09. **Rotary Converters.** MILES WALKER (British Westinghouse Co.). In order to admit of rocking the brushes over a wide arc without sparking, so as to vary the pressure on the D.C. side, the main poles are divided into two portions by cutting away the pole-face for a short portion of the arc. At this part, where the gap is large, a uniform weak field is obtained, proportional to the load, owing to the effect of the series winding, and this ensures good commutation. The brushes are rocked so that the E.M.F. generated by this flux assists or opposes the main E.M.F. Four claims, six figures.

14,548/09. **Electric Oven.** J. G. CHILDS and T. S. HILL. The oven proper consists of a box of sheet metal with a door provided with a glass window so that the contents of the oven can be inspected without opening it. The box is supported on slabs of heat-insulating material, placed edgewise in an outer casing of wood. This outer casing has a door of special construction to ensure an air-tight joint. Six claims, two figures.

21,021/09. **Wiring System.** J. S. HIGHFIELD (Metropolitan Electric Supply Co.). In wiring systems where the conductors are carried one in each edge of a flat flexible strip of insulating material, difficulty has been experienced in making an angle in the plane of the strip. According to this invention, the strip is bent in its own plane so that the outside wire is curved through the required angle. The inner wire is bent similarly, but projects up from the plane of the strip, and to protect it a hemisphere of metal with slots to fit the strip is screwed over the bend. Two claims, three figures.

21,526/09. **Third-rail Insulator.** A. WATKINS. The circular porcelain body has a central vertical passage for receiving a portion of a wooden liner, which rests on the top of the insulator and forms a cushion for the rail. The rail is fixed to the insulator by clamps bolted to it and formed with hooks engaging with the rail on each side. A metal ring surrounding the conical base of the insulator is gripped to the sleeper by hooked clamps bolted to it. Three claims, four figures.

24,134/09. **Oscillation Generator.** H. MANDERS. This is an oscillation generator for producing sustained oscillations for wireless telegraphy and other purposes. The plane of the discharge is vertical, and the upper electrode is suspended by springs. Its movement is electromagnetically controlled so that automatic regulation of the critical length of the arc is obtained with simultaneous preservation of the parallelism of the discharging surfaces. Eight claims, two figures.

28,732/09. **Brake Blocks.** J. A. PANTON (Liverpool Overhead Railway). This patent covers a construction of brake block of the type in which the wearing shoe is provided with a reinforcing back of tough metal and a key lug for attaching the shoe in its place in the brake head. The lug is anchored upon the back across its full length, and is made thicker than is usual. Cast metal is run round the back and around the base of the lug. The cast block may be worn right down to the backing without the lug coming off. Seven claims, eight figures.

30,093/09. **Prepayment Meter.** C. H. HIBBERD. This comprises any suitable train of gearing driving a disc and controlled by a coin-freed mechanism. An arm rotated about the same axis as the disc by the motor meter moves axially under the influence of a spring and engages the disc. Assuming the meter to be running and no further coin inserted, the arm finally engages the disc and first moves the switch so as to throw in a resistance and dim the lights. After a predetermined time, the switch is caused to cut off the current completely. Five claims, six figures.

12,709/10. **Gun and Turret Control.** H. C. LEAKE. In a system of control for motors employed for rotating turrets and training and elevating guns, some or all of the motors for one or more turrets are connected in series, and are supplied from one constant-current generator. The motors are series-wound or separately excited, and each is controlled by means of a movable brush rocker, by which the torque can be varied from zero to a maximum in either direction. The motors not required at any time are short-circuited. Control can be effected by means of resistances in the fields when the motors are separately excited. Two claims, one figure.

Opposition to Grant of Patents

10,791/09. **Battery Electrolyte.** G. SCHAULI. Opposition has been entered to the grant of this patent. The specification was abstracted in ELECTRICAL ENGINEERING, June 2nd, 1910, p. 364.

17,960/09. **Metal Filament Lamps.** FELTEN & GUILLEAUME LAHMEYER-WERKE A.-G. The grant of this patent is opposed. The specification (abstracted in ELECTRICAL ENGINEERING, May 26th, 1910, p. 346) describes the prevention of disintegration of the filaments by the introduction of phorphorus nitride into the bulb.

18,228/09. **Wall-plug.** J. F. and E. S. CONRADI (British Central Electrical Co.). In consequence of opposition, this patent has been surrendered. The specification was abstracted in ELECTRICAL ENGINEERING, April 28th, 1910, p. 290.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: LESSING [Carbons] 15,647/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: FIELD and FERRANTI, LTD. [Generation and distribution systems] 12,685/09.

Dynamos, Motors, and Transformers: POHL and PHŒNIX DYNAMO MANUFACTURING CO. [Commutator machines] 15,319/09; LEITNER [Train-lighting system] 15,325/09; CROMPTON & CO., MACFARLANE and BURGE [Motor-generators and motor control] 15,494/09; DELON [Production of H.-T. direct current] 847/10; SIEMENS SCHUCKERTWERKE GES. [Polyphase commutator machines] 1,611/10.

Electric Ignition: ROBINSON and KYNOCH, LTD. [Electric blasting fuses] 28,532/09.

Electrometallurgy and Electrochemistry: GRUNWALD [Induction furnace] 14,937/09; LACROIX [Electrolysis] 845/10.

Switchgear, Fuses, and Fittings: BERRY [A.-C. distribution apparatus] 7,121/09; HOWGRAVE-GRAHAM [Switches] 14,833/09; HANSFORD and WRIGHT [Automatic switches] 15,086/09; CLARKE [Lamp-shades] 20,342/09; KINGSBURY (*Weston Electric Co., U.S.A.*) [Automatic sequence switch] 20,840/09; WATERHOUSE [Wiring fittings] 24,770/09; D'OLIER [Lamp-shades] 4,425/10; DOCKING [Pendant fitting] 5,735/10.

Telephony and Telegraphy: POTTS [Telegraphy] 15,167/09 and 8,610/10.

Traction: ADAMS [Trucks] 18,654/09; MUNRO and RAILLESS ELECTRIC TRACTION CO. [Collectors] 22,087/09; FREDERICKS, RUSSEL, WEDDING and CONNELLY [Trolley] 23,504/09; SIEMENS & HALSKE A.-G. [Signalling] 10,087/10.

Miscellaneous: HAILWOOD [Miners' safety lamps] 14,914/09; ELECTROMOTOR EQUIPMENT CO., and MEACOCK [Combined friction clutch and brake] 16,113/09; ROYCE, LTD., and HULLEY [Capstans, cranes, &c.] 22,454/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: W. C. HERAEUS GES. [Mercury-vapour lamps] 1,782/10; PODSZUS [Vapour apparatus] 14,857/10.

Dynamos, &c.: A.-G. BROWN, BOVERI ET CIE. [Driving of machines] 13,502/10; ALLGEMEINE ELEKTRICITÄTS GES. [Machines] 14,024/10 and 14,862-3/10.

Miscellaneous: SIEMENS & HALSKE A.-G. [X-ray apparatus] 13,765/10; MARMION [Alarm-contacts under carpets] 14,742/10; ENGEL [Contact device] 15,150/10.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

16,445 of July 24th, 1896. **Railway Points.** SIEMENS BROS. & CO., LTD. (*Siemens & Halske A.-G.*). This patent covers a method of control for motor-actuated railway points. Two electromagnets are employed, and the control of the actuating motor is separate from the control of the point rails and their connections. The use of a reversing mechanism for the motor, not connected with the points, is also covered.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: E. A. CAROLAN (*General Electric Co., U.S.A.*) [Clutch mechanism] 7,459/03, and [Mechanism for magnetite lamp] 7,662/04.

Distribution Systems, &c.: C. JUNG, A. BRECHER and A. KITTEL [Insulating material] 5,755/00.

Dynamos, &c.: J. JOHNSON (*Elektricitäts A.-G.*) [Flywheel storage system for electric winding] 7,716/03.

Incandescent Lamps: L. SUNDERLAND and G. PILLINGER [Lamp cap] 6,456/05.

Instruments, &c.: H. P. DAVIS and F. CONRAD [Moving coil instrument] 21,810/99.

Storage Batteries: T. PESCATORE and TUDOR ACCUMULATOR CO. [Manufacture of plates] 6,723/01.

Switchgear, &c.: L. BRADLEY and S. ALLEN [Variable resistance] 7,561/03; LAND and SEEKABELWERKE A.-G. [Protective devices] 3,510/05.

Traction: J. ALDWORTH [Bracket for trolley head] 7,625/03; H. PEIPER [Petrol-electric systems] 7,526-7/04.

Miscellaneous: J. W. STOVER [Date and time stamp] 5,731/00; LAMSON PNEUMATIC TUBE CO. and R. JENNEY [Electrically operated despatch apparatus] 6,150/00; I. B. BIRNBAUM and F. BELL [Street fire-alarm] 6,866/05.

Digitized by Google

MULTIPLE UNIT SINGLE PHASE TRAINS ON THE NEW YORK, NEW HAVEN AND HARTFORD RAILWAY

THE *Electric Railway Journal* (New York) contains some particulars of the new single-phase multiple-unit cars which have recently been put into service on the New York, New Haven & Hartford Railway. All these cars are constructed without wood; the floors are of cement, and the metal walls are finished to imitate mahogany. Each motor-car weighs about 77 tons, and is designed to haul two trailers each weighing about 44 tons.

The cars are constructed to work either on the 11,000-volt single-phase circuit or on 600 volts direct current, and the electrical equipment of each consists of four Westinghouse 150-h.p. single-phase series motors, which are geared to spring-supported "quills," arranged in a similar way to those of the well-known New York, New Haven & Hartford gearless locomotives. This arrangement was illustrated in ELECTRICAL ENGINEERING, Vol. V., page 10 (January 7th, 1909). The quill encloses the axle, instead of forming the armature shaft (as is the case with the locomotives), and is carried from each wheel by means of four pins in spring pockets in the wheel, surrounded by eccentrically wound helical springs.

Each motor, which has six poles, has a nominal rating of 150 h.p. on the one-hour rating, with forced ventilation, and may be operated continuously at approximately 75 per cent. of its one-hour current rating. The field winding is of the compensated-series type, and the armature is provided with preventive leads. Use is made of partially closed slots in the armature core and an especially rigid commutator construction. The leads have been brought out on the axle side instead of the bolster side of the frame, so that they may be secured without interference from truck parts or brake rigging. The weight of the motor, complete with gears, gear case, axle bearings, and quill, is approximately 7,450 lb., and of the motor only, approximately 5,600 lb. The quill complete weighs about 1,400 lb. The motors are connected four in series, or two in series and two in parallel when working on the direct-current section. On alternating current they are permanently connected two in series and two in parallel. A complete motorman's equipment is placed in both ends of every car, trailers as well as motor-cars, so that the train can be operated with "trailer" cars in front if so desired. A step-down air-blast transformer is placed under the floor at the middle of each motor-car. The air for cooling the transformers and motors and for operating the brakes, whistles, pantograph, and third-rail shoes is supplied by a motor-driven compressor, which is capable of delivering 35 cubic ft. of free air per minute. The overhead current collector is of the pneumatically operated pantograph type, similar in construction to those used on the New Haven locomotives. The upward pressure ranges from 15 to 20 lb., and with the steel contact wire, which is now used on this line, this high pressure does not produce the excessive wear that occurred when a copper contact wire was used. When running, the forward pantograph is usually down, and the rear one up. In this way, in case of any accident to the collector which might drag it off the car, the forward one is still intact, whereas were the forward collector to be torn off it would probably take the rear one with it. In passing from the alternating-current section to the direct-current third-rail system, or *vice versa*, the necessary change of connections is accomplished by an automatic air-operated change-over switch.

During a test run a motor-car with two trailer cars, having a total weight of 371,400 lb., accelerating up to 25 m.p.h., had an average acceleration of 0·5 mile per hour per second.

LOCAL NOTES

BECKENHAM: *"Free Wiring."*—At the last meeting of the Council, Mr. A. H. Dykes called attention to the "free wiring" undertaking of the Council. He said that he was not concerned at the moment as to whether free wiring was paying or not, but wished to call attention to the figures in connection with it. There were 27 consumers, and the average cost per lamp was 23s. 4d., whilst the average receipt for sale of current had gone down to 3s. 9d., whereas some time ago it was 7s. 9½d. per lamp. A good many of the consumers were not paying anything like their proper proportion, and he urged that no "free wiring" should be undertaken unless the consumer paid not only the cost of the wiring, but also a proper proportion of the standing charges. One particular consumer with 10 lamps cost the Council 30s. per light, and the return they got was 15s. 10d. per light. Two other consumers each with 20 lamps produced a return of 4s. 10d. per lamp and 2s. 1d. per lamp respectively. He urged the adoption of some system by which a definite return for each lamp wired was obtained.

BIRMINGHAM: *Halesowen Light Railway.*—The Light Railway Commissioners have decided to grant a new order authorising the Birmingham Corporation to construct the portion of the Halesowen light railways which has, by reason of certain extensions of boundaries, come within the Birmingham Corporation jurisdiction.

CARLISLE: *Electricity Profits.*—After a lengthy discussion the Corporation have decided to allocate £1,000 of the electricity profits to relief of rates; £1,000 to reserve fund; and to carry forward the balance of over £1,000.

CORK: *Overhead Wires.*—At the last quarterly meeting of the Rural District Council, a resolution calling upon the Cork Electric Lighting Co. to remove the overhead wires which they have erected for supplying electricity in the rural district was passed. It was pointed out that the erection of overhead wires is illegal, as under the Company's Provisional Order they are bound to lay underground mains. This resolution, however, does not seem to be decisive, as the matter has been referred to the County Council.

DUNDEE: *Wiring Contractors and the Council.*—The Incorporated Municipal Electrical Association have communicated with the Council, in common with all other municipalities, relative to the proposal made at the Glasgow Convention of the Association in June, that a Bill should be promoted in Parliament giving wiring powers to all municipalities. The Electricity Committee have agreed to support the proposal, and in this connection a discussion took place, in which some objections were taken to the proposition. Mr. H. Richardson, the City Electrical Engineer, expressed his strong opinion that such powers ought to be in the hands of all municipalities, if only for the moral effect. Personally, he was quite in favour of the contractors doing the work, and did not wish to set up a department for this purpose, but hitherto contractors had adopted the policy of picking and choosing, and if municipal electricity departments left the canvassing to the contractors they would not move ahead at all. A little while ago at Dundee the Electricity Department slackened off in its canvassing, and their business went down immediately. He had found that over 90 per cent. of the extra business obtained in Dundee, even although the contractors supplied it, was canvassed for by the Department's men, and the specifications were actually prepared by the Department.

EDINBURGH: *Proposed Electric Tramways.*—A proposal has been placed before the Town Council by a London company for the construction of a network of electric tramways in Edinburgh.

JAPAN: *Electric Tramways.*—The British Acting Consul at Tamsui reports that applications have been addressed to the Formosan Government by three rival groups of company promoters for a concession for the construction of electric tramways in Taihoku, where there is a population of 84,000. The names of the applicants are on file at 73 Basinghall Street, London.

KIRKCALDY: *Electric Lighting and Tramways Accounts.*—There was a net profit of £700 on the Electricity Department last year, and £44 on the tramways.

LEICESTER: *Management of Electricity Undertaking.*—The Electric Lighting Committee have retained Mr. James Swinburne to advise them in connection with the proposal to amalgamate under one control the electric lighting station and the tramways power station.

[illegible]: *London County Council: Invention by an Official.*—Mr. A. Champion, an assistant in the Electrical and Highways Branch of the Chief Engineer's Department, has been granted permission to patent an invention in connection with the construction of electric junction boxes for the prevention of gas and water accumulation therein, on the condition that the Council be allowed to use the patent without payment.

New Tramway Proposals.—The Highways Committee recommend application being made to Parliament next session for new tramways in various parts of London, aggregating twenty-two miles of single track, at an estimated cost of £462,470. With the exception of one line, from Marble Arch to Cricklewood, which will be a combination of overhead and conduit, the remaining eight lines are on the conduit system. The figure given of estimated cost is exclusive of cars, car sheds, sub-stations, &c.

Bermondsey: Electricity Accounts.—Reporting upon the small net profit of £43 on the electricity undertaking last year, the Finance Committee state that the result is partly due to the very low price at which energy is now being sold, and they

Digitized by Google

think the Council should be very careful as to how the undertaking is managed in the future.

Hackney: Heating and Cooking.—To stimulate the demand for heating and cooking, the charge for energy for all domestic purposes, except lighting, is to be fixed at 1d. per unit. A modified "telephone" system of charging is also to be introduced.

Hampstead: Street Lighting.—The Lighting Committee have been authorised to convert a further 802 gas lamps to incandescent electric lamps.

Marylebone: Wiring Work. The electricity accounts for the past year show a net profit of £8,482, against a loss in the previous year of £930. The number of units sold was 10,776,459, an increase of 1,775,598. This is partly due to the public lighting extension scheme, but chiefly to some very important additions to the consumers' roll, assisted by the more active policy which has been initiated in obtaining new business. The average revenue per unit was 3·8d., compared with 4·13d. in the previous year, and the cost per unit sold amounted to ·961d., compared with 1·19d. in the previous year. The revenue from the Sales Department was £6,666, whilst the expenditure was £7,851. These figures, however, do not represent a complete year. It is pointed out that the Department has the benefit of fifteen outdoor representatives for the same net expenditure as the original staff of five. The report points out that it is no part of the policy of the Sales Department to take from private contractors work which would have been carried out by them. On the contrary, many instances have occurred where, while the preliminary work and expense of advising, estimating, and planning for new installations or extensions has been done freely by their staff, the order has been given to a private contractor. In other cases they have been withdrawn as soon as it has been found that a contractor was already dealing effectively with the work in hand. The sum of £6,168 of the balance has been used in connection with the public street lighting scheme.

Poplar: Electricity Accounts.—The accounts of the Electricity Department for the past year show a net profit of £4,426, compared with £3,381 in the previous year. The report of the Borough Electrical Engineer points out that negotiations are being carried on for a supply in bulk from the Stepney Council, which will save capital expenditure in anticipation of increasing demands.

Stepney: Electricity Accounts.—The accounts of the Electricity Department for the year to March 31st show a gross profit of £20,816, and after meeting capital charges there is a net profit of £1,515. The net revenue was £52,266, compared with £46,934 in the previous year. The average income per unit is the lowest in London, namely, 1·458d. Mr. W. C. P. Tapper, the Borough Electrical Engineer, calculates that had they received per unit an amount equal to the average price received by all other Metropolitan Supply Authorities and Companies—according to the latest available figures, 2·49d.—the net profit at Stepney would have been £35,954.

MACCLESFIELD: *Electricity Supply.*—The Council have received two letters giving notice of proposed applications to the Board of Trade for Electric Lighting Provisional Orders for the district.

PENZANCE: *Electric Supply.*—The Penzance District & Electric Supply Co. have informed the Council that a bulk supply of electricity will be available from the Cornwall Electric Power Co. before the end of the year. In this connection the Power Company have applied to the Board of Trade for consent to erect certain overhead electric mains from their power station which they are erecting at Hayle.

PRESTON: *Tramways to Chorley.*—The Anglo-Continental Industries, Ltd., have put forward a proposal for constructing a tramway between Chorley, Horwich, and Preston. The lines proposed aggregate twenty-three miles of track, and will touch a population of 100,000. The estimated cost will be about £300,000. Some years ago a Company received Parliamentary powers to construct lines between these towns, but the powers lapsed.

RUSSIA: *Tramways.*—The Belgian Company which controls the electric lighting and tramways in Sebastopol has recently obtained a concession for the construction of an electric tramway at Symphcropol, the chief town of the Crimea.

SHEFFIELD: *Electricity Accounts.*—At the last meeting of the Council, the electric lighting accounts were discussed, several members taking objection to the charges made for electrical energy. Alderman Bennett, who introduced the accounts, said that but for the set back caused by the use of metal filament lamps, there would have been a profit of £4,880, instead of a deficiency of over £2,000. Other speakers pointed to the fact that the condition of the undertaking had been severely handicapped by the high price of £168,754 which had been paid for the original Company in Sheffield. The Chairman of the Committee promised an opportunity for a full discussion with reference to the charges at an early date.

SOUTH SHIELDS: *Electricity Accounts.*—After meeting capital charges, the electricity accounts for the past year show a deficit of £209, compared with a surplus of £1,209 in the previous year.

TASMANIA: *Launceston Tramways.*—The Council have taken up a loan with the Commercial Bank of Tasmania for £50,000 at 4 per cent., repayable in thirty years.

TAUNTON: *Electricity Accounts.*—The accounts of the Electricity Department for the past year show a gross profit of £3,941, and a deficit, after meeting capital charges, of over £400.

WALSALL: *Supply in Bulk.*—The Electricity Committee have considered the offer of a power company to supply the Corporation with electricity in bulk, but recommend that it should not be entertained.

WEST HARTLEPOOL: *Purchase of Tramways.*—The Hartlepool Tramways Co. are asking £22,000 for their undertaking, but as this is far beyond the figure which the Corporation are willing to offer, arbitration proceedings must be taken.

WHITLEY: *Tramways.*—The Whitley and Monkseaton Council have appointed a Committee to meet representatives of the Blyth Council with a view to the construction of electric tramways between the two towns.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

BECKENHAM.—Loans of £5,000 for mains and services, and £1,000 for meters, are to be applied for.

BELFAST.—The Harbour Commissioners require 3¼ miles of 7/18 H.T. cable for 3,000 volts C.C., and ½ mile of 7/18 rubber-insulated cable. Particulars from the Harbour Engineer, and tenders by July 27th.

DOVER.—The Electricity Committee have decided to lay a cable for furnishing power to the Harbour Board and the Admiralty Pier at an estimated cost of £525.

DUBLIN.—The South Dublin Board of Guardians having been granted permission to borrow £3,000 in respect of the electric lighting of the Workhouse buildings, applied to the Board of Public Works for a loan. Owing to the high rates in the Dublin area, the Board have refused to make a loan, and consequently the Guardians propose to advertise for offers.

DUNDALK.—Mr. A. P. Trotter, the Electrical Adviser to the Board of Trade, held an enquiry last week to consider the objections to the Dundalk Electric Lighting Provisional order. The chief objections to the scheme were in respect of overhead wires.

ECCLES.—The Local Government Board have sanctioned a loan of £3,234 for electrical purposes.

INDIA.—The Lahore Municipality are contemplating an electrical installation, and the Government are to be asked for a donation in connection with it.

LONDON: *Battersea.*—Cable extensions are to be carried out at an estimated cost of £1,061.

The Finance Committee of the L.C.C. recommend sanction to a loan of £9,905 for electrical extensions.

Hackney.—Switchboard extensions, at an estimated cost of £900, are to be carried out.

SOUTH AFRICA.—Large extensions of the generating plant are necessary at the Johannesburg Municipal Electricity Works.

WALSALL.—Extensions at the generating station are to be carried out at an estimated cost of £23,225. Of this £16,425 are for extensions to generating plant, and the remainder for mains.

WHITEHAVEN.—An enquiry was held last week concerning a loan of £5,293 for electrical extensions. Of this £2,993 are for plant extensions, and £2,300 for mains. During the enquiry Mr. H. R. Hooper, the Local Government Board Inspector, remarked that the estimates seemed to be more than double what they ought to be, and he made certain suggestions in this connection. He also urged upon the Council the necessity for "pushing" the undertaking.

WIMBLEDON.—The Council have received the sanction of the Local Government Board to borrow the following amounts: £3,400 for mains, £1,600 for house services, and £1,600 for meters.

WOLVERHAMPTON.—The following additions are to be made at the power house. Water softening plant (£400); renewal of economisers (£600); pump house and storage tank (£450).

Miscellaneous

BELFAST.—A scheme of tramway extensions, at an estimated cost of £132,350, has been adopted by the Corporation.

INDIA.—The Secretary of State for India requires electrically-driven water-supply pumps. Particulars from the Director-General of Stores, India Office, Whitehall, London, S.W., and tenders by August 3rd.

LONDON: *London County Council.*—The Council require 4,800 steel tyres for driving wheels, and 1,600 steel tyres for pony wheels for electric tramcars. Particulars from the Chief Engineer, and tenders by July 26th.

Digitized by Google

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.E.—Cinematograph hall, St. James Road, Bermondsey. H. E. Barley, 38 Lime Street, E.C.

E.—Mill, warehouse, &c., Cairn Mills, Silvertown. Architect, Bruce Dawson, 6 Old Queen Street, S.W.

E.C.—Proposed extensive alterations to Guildhall, E.C. F. Sumner, Engineer and Surveyor, Guildhall, E.C.

N.—Cookery depôt (£2,921), Tottenham. Surveyor, Education Committee, Tottenham.

W.C.—Theatre, Shaftesbury Avenue, W.C. Architect, B. Crewe, 75 Shaftesbury Avenue, W.C.

PROVINCES.

AIRDRIE.—Town hall (£10,000). Burgh Surveyor.

AYR.—Club premises, shops, and workrooms, Sandgate and Boswell Park (£4,000). G. S. Abbott, Braemar, Ayr.

BANGOR.—St. Paul's Schools. T. Gill, Surveyor, Bangor.

BIRMINGHAM.—Consumptive hospital. Sir Hallewell Rogers, Chairman, Board of Delegates, Birmingham Hospital Saturday Fund.

BURTON-ON-TRENT.—Theatre. Thos. Jenkins, Architect, Burton.

DARTFORD.—Workrooms, Darenth Asylum (£5,198). Architect, T. W. Aldwinckle, 20 Denman Street, W.

DERBY.—County buildings (£22,000). County Surveyor.

DUMFRIES.—It has been decided to light the Academy by electricity. The Dumfries School Board have the matter in hand.

EDLINGTON.—School (£12,000). W. V. Dixon, Secretary, Education Committee, West Riding C.C., Wakefield.

GLASGOW.—Electric theatre, Bridgeton Cross (£4,000). Architect, G. A. Boswell, 53 Bothwell Street, Glasgow.

Co-operative buildings (£15,000). Architects, Bruce & Hay, 261 West George Street, Glasgow.

KEIGHLEY.—Villa (£1,100). Architect, D. W. Weatherhead, Law Street, Keighley.

KING'S LYNN.—Conservative club. Architect, H. Tilson, Paradise Parade.

LEITH.—Extensions, Messrs. Cochrane's factory (£2,250). Architect, R. S. Henderson, 20 Leith Walk.

MEADOW BANK.—School (£2,400). Architect, c/o Winsford & Middlewich Education Sub-Committee.

MERTHYR.—Extensions, hospital (£3,000). D. & J. Jenkins, builders, Penydorren.

Conversion of Cyfarthfa Castle into school (£16,200). Jones Bros., builders, Treharris.

NEWPORT (MON.).—School (£10,000). C. Ward, Town Hall, Newport.

ROCHDALE.—Alterations and extensions, Town Hall (£2.075). S. S. Platt, Borough Surveyor.

SOUTH SHIELDS.—Co-operative store (£1,430). J. E. Stout, architect, Commercial Chambers, South Shields.

TUNBRIDGE WELLS.—Fire station, Calverley Parade Mews. W. H. Maxwell, Borough Surveyor.

WEDNESBURY.—Theatre. Architects, Bishop & Grundy, Wednesbury.

TENDERS RECEIVED AND ACCEPTED

CARLISLE.—The tender of Messrs. Pratchett Bros., of Carlisle, at £652, has been accepted for pipe-work at the generating station.

CROYDON.—The Corporation have accepted the tender of Messrs. Johnson & Phillips, Ltd., at £349, for the electric lighting of the extensions to the Borough Hospital. There were 26 tenders varying from that accepted to £784 12s. 3d.

LONDON: *London County Council.*—Tenders have been received for 250 electric cars of the bogey truck double-deck type, fitted with roof covers and draught screens. For the car bodies, the tender of the Brush Electrical Engineering Co., Ltd., amounting to £94,375, is recommended for acceptance; for the trucks, that of Messrs. Heenan & Froude, Ltd., at £28,750; and for the electrical equipments, that of the British Westinghouse Co. at £83,812 10s. Messrs. Dick, Kerr & Co., Ltd., and the British Thomson-Houston Co., Ltd., also tendered for electrical equipments, their prices being £85,000 and £86,187 10s. respectively. Messrs. Dick, Kerr & Co. proposed to supply interpole motors. The Committee point out that the controller fingers in this tender were not quite to specification, and the schedules of rates of pay and hours of labour were not filled in. The tender of the Westinghouse Co. is also recommended for acceptance for 250 sets of magnetic brake equipments at £14,250. Under these contracts the cost of each car will amount to £683 15s., against £884 15s. under the contracts in 1909.

The following tenders have been received for the supply of low-tension cables, cable boxes, &c., in connection with the wiring for power purposes of the second section of the Central Car Repair Depôt:—Western Electric Co., Ltd. (recommended), £948 14s.; Johnson & Phillips, Ltd., £979 12s.; W. T. Glover & Co., Ltd., £1,004; Siemens Bros. & Co., Ltd., £1,011 12s.; W. T. Henley's Telegraph Works Co., Ltd., £1,016; British Insulated & Helsby Cables, Ltd., £1,053; Callender's Cable & Construction Co., Ltd., £1,053.

Hackney.—The present contract with the British Insulated & Helsby Cables, Ltd., for cables, is to be extended to include new mains at an estimated cost of £18,384.

Hammersmith.—The Electricity Committee have accepted the tender of Ferranti, Ltd., at £3, for all sizes of prepayment meters for 110 and 220 volt. For the supply of one 200-kw. transformer, the tender of the British Electric Transformer Co. has been accepted at £159.

LOWESTOFT.—The Council have accepted the tender of the Standard Cable Co. at £326 for a supply of cable. Two years guarantee is given.

NEWPORT (MON.).—The tender of the General Electric Co. at £3,063 has been accepted for extensions to the switchgear. The tender of Messrs. Balcke & Co. at £681 has been accepted for a cooling tower, that of Messrs. Babcock & Wilcox for fixing superheaters to six boilers at £915, and the Albion Clay Co. for four-way ducts for electric cables at 3s. 11½d. per yard, less 2½ per cent.

STRETFORD.—The District Council have accepted the following tenders for the electricity undertaking:—British Westinghouse Co., Ltd.; three-wire booster, £832, and safety attachment, £51; Worthington Pump Co., Ltd.: condensing plant, £1,180; James Hodgkinson (Salford), Ltd.: one pair patent coking stokers, £132 10s.; E. Green & Sons, Ltd.: additional economiser tubes, £110.

TASMANIA.—The Launceston Council have accepted the following tenders:—Car-sheds and offices, Messrs. J. & T. Gunn, Ltd., £2,989; trucks, Brush Electrical Engineering Co., Ltd., £1,122; motor equipments, Australian General Electric Co., Ltd., £3,206. The Council have also accepted the tender of Messrs. Hinman & Wright, at £937, for alterations to the sub-station in Cameron Street.

WEST HAM.—The Council have accepted the following tenders for the electric lighting of certain schools: Clarkson Street, Newbald & Co. (Stannos system), £153 10s.; Denmark Street, Weston & Sons, Ltd. (Simplex system), £136 11s.; Hallsville, ditto, £115 13s.

The following tenders have been accepted by the Government Departments named:—Admiralty: Batteries, boxes, &c., Atlas Carbon Co., Ltd., India Rubber, &c., Co., Ltd., Siemens Bros. & Co., Ltd.; indicators, Elliott Bros.; switches, Thames Ironworks Co., Ltd. War Office: Electric cable and wire, &c., Callender's Cable & Construction Co., Ltd., Hooper's Telegraph and India Rubber Works, Ltd., W. Rickard, Ltd.; testing dynamos, Laurence, Scott & Co., Ltd. India Office: Cables, India Rubber, &c., Co.; insulators, Bullers, Ltd. General Post Office: Telegraph apparatus, Brown & Murray, Ltd.; telephonic apparatus, Peel-Conner Telephone Works, Ltd., Western Electric Co., Ltd., British L. M. Ericsson Manufacturing Co., Ltd.; zinc battery plates, Siemens Bros. & Co., Ltd.; paper core cable, British Insulated and Helsby Cables, Ltd., Henley's Telegraph Works, Co., Ltd., Johnson & Phillips, Ltd., Western Electric Co., Ltd.; electrically driven air-compressing plant at G.P.O. (West), London, E.C., Alley & MacLellan, Ltd.; electric lighting of extension of Bristol head post office, Alexander Hawkins & Sons; installation of local telephone exchange equipment at telephone exchange, Monserrat Road, Putney, S.W., Western Electric Co., Ltd., L. Shaw. Commissioners of Public Works, Ireland: Electrical equipment of the New Royal College of Science, Dublin, V. G. Middleton.

The D. P. Battery Company, Ltd., call attention to the present low prices of batteries, due to the depreciated market values of lead. Amongst many other orders this firm are now installing a second large battery at Letchworth for the First Garden City, Ltd., and have recently supplied three light and power batteries to the Midland Railway Co., the Melbourne Electric Light & Power Co., and the Blackpool Co-operative Society. They are also shipping five batteries for India, China, New Zealand, and the Argentine, and have even been able to ship to the United States, in spite of the tariff.

Railway Signals and Tramways.—The Highways Committee of the L.C.C. report that complaints have been received from the engineer to the London, Brighton & South Coast Railway of interference with that company's signalling apparatus at Tulse Hill station, and other stations in the neighbourhood by the working of the Council's tramways between Loughborough Junction and Norwood. These lines are worked on the overhead trolley system. The railway company's engineer intimated that he proposed to duplicate the signal wires affected at the cost of the County Council. As a result of a conference between the parties, however, Professor Gisbert Kapp has been appointed arbitrator to settle the point in dispute.

OSRAM·LAMPS

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £56 5s. to £56 15s. per ton (last week, £56 5s. to £56 15s.).

AGENCY.—Messrs. W. F. Dennis and Co. (49 Queen Victoria Street) have been appointed sole agents in the United Kingdom for the Karlsbaden Kaolin Industrie Gesellschaft, Merkelsgrün, Austria, makers of porcelain insulators, &c.

TURBO PUMPS.—Messrs. Willans & Robinson, Ltd., ask that all inquiries for their "Victoria" turbine pumps should be addressed to Victoria Works. We understand that some 20 of these new pumps have already been delivered, varying from 150 up to 9,400 gallons per minute capacity, for heads from 35 to 535 ft.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—A receiver has been appointed to the Witney Electric Supply Co., Ltd., on the motion of a debenture-holder. A receiver was applied for owing to the interest on debentures not having been paid.

A meeting of the Britannia Electric Lamp Works (1905), Ltd., will be held on August 9th, at 11 a.m., at Broad Street House, New Broad Street, London, E.C., to hear the liquidator's account of the winding-up.

F. Sheppard, electrician, 4 Haslett Road, Kensington, London, has been adjudicated bankrupt. The public examination will be held on August 16th at Bankruptcy Buildings, London, at 11 a.m.

A meeting of the Alliance Electrical Co., Ltd., will be held at 23 Grafton Street, London, W., to-morrow (Friday), at 11 a.m., for the purpose of arranging a reconstruction. This is merely a voluntary liquidation for rearrangement of capital, and all the creditors will be paid in the ordinary course.

TRADE WITH GREECE.—The 20 per cent. import duty on electrical machinery has been dropped, and imports of this nature are now free of duty.

AWARD AT THE JAPAN-BRITISH EXHIBITION.—In addition to the awards in the Electrical Engineering Section mentioned in our issue of last week, we learn that Messrs. Hans Renold, Ltd., have been awarded a gold medal for their exhibit of steel driving chains.

HOLIDAYS.—Messrs. Mawdsley's Ltd., Dursley, Gloucestershire, ask us to state that their works will be closed from Friday, 29th inst., till Monday, August 8th.

OSRAM LAMPS.—In view of the fact that in a number of cases the brass caps of high candle-power lamps used for street lighting have corroded away before the filaments have failed, the General Electric Co. have decided in future to supply the high candle-power Osram lamps with plated copper caps instead of brass.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. H. Rider, Chief Electrical Engineer to the L.C.C., has resigned, having accepted an important appointment in South Africa. Mr. Rider's resignation will take effect from August 31st, 1910. We understand that Mr. Rider's new appointment is that of Chief Electrical Engineer to an important group of mines on the Rand.

Mr. Walter H. Derriman has entered into partnership with Messrs. Dicker & Pollak, Chartered Patent Agents, of 37 Furnival Street, Holborn, E.C., and, in consequence, the name of the firm has been changed to Dicker, Pollak & Derriman. Mr. Derriman is personally taking charge of the electrical business of the firm.

Mr. G. F. Craven, Assistant Engineer of the Reading Corporation Tramways, has had his salary increased from £160 per annum to £180 per annum, to rise by two further annual increments of £10 each to £200 per annum.

The Birmingham Electricity Committee have unanimously decided to recommend the City Council to appoint Mr. Howard Foulds to the position of Secretary of the Electric Supply Department. For the past sixteen years Mr. Foulds has held the position of Secretary to the Electrical Standardising, Testing, and Training Institution, Faraday House, London. Three hundred and twenty-two applications were received for the post, and the following were selected for the short list: Mr. Howard Foulds, secretary of the Faraday Electrical Institute, London; Mr. W. E. Foden, assistant secretary of the Electricity Department, Manchester; Mr. W. T. Green, chief clerk of the Leeds Electric Supply Department; and Mr. E. J. Jennings, secretary to the St. Marylebone Electrical Supply Department. The salary attached to the new post is £600 per annum.

The Marylebone Electricity Committee report that they consider it is all important to secure continuity of management in the Electricity Department during the next four years, and they therefore propose that the Council should enter into agreements with certain officers in the Department. The details of the agreements proposed are as follows:—(1) Mr. A. H. Seabrook, general manager; present salary, £800; proposed salary from July 1st, 1910, £850, rising by £50 per annum to £1,000, plus 2 per cent. on profits up to £10,000 and 3 per cent. on the profits beyond. (2) Mr. Jennings (secretary and accountant); present salary, £400; proposed salary from July 1st, 1910, £425, rising by £25 per annum to £500, plus 1 per cent. on profits up to £10,000 and 1½ per cent. on the profits beyond. (3) Mr. Richardson (station superintendent), Mr. Smyth (main superintendent), and Mr. Holmes (sales manager) each receive £400 per annum at present, and it is proposed to increase this in each case by four annual increments of £25 to £500, with 1 per cent. on profits up to £10,000, and 1½ per cent. on the profits beyond.

Mr. G. D. Vickers, of Birmingham, has been appointed Assistant Electrical Engineer to the Watford Council.

The Electricity Committee of Burton-on-Trent Corporation has decided to increase the salary of Mr. T. Hall, Assistant Manager of the Electricity Department, from £160 to £170 per annum.

MISCELLANEOUS CITY NOTES

CENTRAL LONDON RAILWAY CO.—It is proposed to raise £500,000 new 4½ per cent. preference stock. Additional borrowing powers to the extent of £160,000 are also contemplated.

DIVIDENDS ANNOUNCED.—Bournemouth & Poole Electricity Supply Co., interim dividend on the ordinary shares for the June half-year at the rate of 5 per cent. per annum, less tax.—Lisbon Electric Tramways, interim dividend of 3 per cent. on the ordinary shares.—British Columbia Electric Railway Co., half-yearly dividend on the 5 per cent. non-cumulative preferred ordinary stock, together with an additional dividend of 1 per cent.—Anglo-American Telegraph Co., 15s. per cent. on the ordinary stock and £1 10s. per cent. on the preferred stock for the June quarter.—County of London Electric Supply Co., half-yearly dividend on the ordinary shares at the rate of 4 per cent. per annum less tax.—Newcastle-upon-Tyne Electric Supply Co., interim dividend of 1¼ per cent. on the ordinary shares less tax.—Metropolitan Railway Co., half-yearly dividend on the ordinary shares at the rate of 1¼ per cent. per annum.

MORTGAGES AND CHARGES.—Particulars of the following have been registered:—Johnson-Lundell Electric Traction Co. Satisfaction in full of mortgage, dated 5th April, 1906, in respect of which £4,070 14s. 6d. was outstanding on 1st July, 1908. —Sunbeam Lamp Co. Issue on 30th June of £6,250 debentures, part of a series of which particulars have already been filed.—Telegraph and Telephone Instruments. Particulars of £600 debentures, created 20th June, 1910, the amount of the present issue being £500. Property charged. The company's undertaking and property, present and future. No trustees.

COMPANIES' MEETINGS AND REPORTS

CITY & SOUTH LONDON RAILWAY CO.—The accounts for the June half-year show a net profit of £47,332, including the balance brought forward. After making provision for debenture stock interest, rent charge, and transferring £1,500 to renewals fund, a full dividend of 5 per cent. per annum is paid upon the preference shares, and 1¼ per cent. upon the ordinary stock for the half-year, carrying forward £1,654.

TRAFFORD POWER & LIGHT SUPPLY CO.—There was a loss of £417 on the past year's working after meeting debenture and loan interest.

ELECTRIC CONSTRUCTION CO.—At the annual meeting on Thursday, Mr. W. S. B. McLaren, M.P., the chairman, said that the present improvement in trade justified their expecting a large demand for electrical machinery during the coming year. He congratulated the shareholders upon the strong financial position of the company, as they had no loans of any kind, and their realisable assets were many times greater than their current liabilities. Moreover, they had been able to redeem on favourable terms £40,000 second mortgage debenture stock.

EDMUNDSONS' ELECTRICITY CORPORATION.—Satisfaction was expressed at the annual meeting on Thursday at the marked and all-round progress of the past year. The carry forward of £25,577 is to be added to the general revenue until 1912, when, according to the trust deed, dividends may be resumed. In the meantime, said Mr. P. D. Tuckett, the chairman, the Board will probably come before the shareholders with a scheme for the reduction of capital which will involve wiping out all special reserves.

NATIONAL TELEWRITER CO.—The first annual general meeting was held on Monday. Sir William Treloar, who presided, said that the results of the first year's working were disappointing, but this had been mainly due to difficulties encountered with regard to the delivery of the instruments. They had now obtained orders for over a hundred instruments, and in addition, trials were being made with the instruments by railway companies, hotels, and others. They now looked forward with confidence to extending their business in the provinces, and in this connection they had appointed agents in the principal provincial centres. They contemplated the early opening of an exchange in the West End of London, and there were indications that the result of the present year's working would be much more satisfactory.

GRINDELL-MATTHEWS WIRELESS TELEPHONE SYNDICATE.—At the statutory meeting last week Sir J. Clifton Robinson, who presided, said that works had been erected at Pilning, on the Bristol Channel, and he believed that not

Digitized by Google

many weeks would pass before it would be possible to give the shareholders some gratifying information.

VICTORIA FALLS & TRANSVAAL POWER CO.—The Marquis of Winchester presided at the annual general meeting on Friday. Dealing with the Transvaal Power Bill, he mentioned that the action of the Company in securing the services of Mr. Vesey Knox, K.C., who visited South Africa accompanied by Mr. A. E. Hadley, the Managing Director, and Mr. Arthur Wright, Electrical Engineer, had resulted in certain amendments to the proposed Act of Parliament, which had the effect of removing any provisions which were calculated to hamper the carrying on of their business. With regard to the supply of electric power, application has been made to the Transvaal Government for the erection of a new station at Vereeniging, and this would undoubtedly add facilities for establishing new industries. Having mentioned that the fullest advantage of the Company's plant could not yet be obtained owing to many important works having to be completed, the Marquis of Winchester mentioned, as an example of the advantage of using electric power in mines, certain figures relating to the City Deep Mines. The use of electric power here had resulted in savings in works cost ranging from 6d. to 1s. per ton crushed, the figures being 14·2d. for electricity and 24·7d. with steam. Sir Charles Metcalf said he had just visited the works of the Company in the Transvaal, and they could congratulate themselves upon them. The deliveries of the A.E.G. had been up-to-date, with the exception of the switchgear, which was delayed owing to a strike at the factory. He anticipated that by the end of next year the sales would be three times what they were to-day.

NATIONAL TELEPHONE CO.—The net profit for the June half-year, after meeting Post Office royalties amounting to £161,530, is £541,300, against £509,210 in the corresponding period of last year. The following dividends are recommended: at the rate of 6 per cent. on the first and second preference shares, 5 per cent. on the third preference shares, 6 per cent. on the preferred stock, and 6 per cent. on the deferred stock, less tax in each case. It is proposed to transfer £175,000 to reserve, and to carry forward £15,344.

MEXICO TRAMWAYS CO.—The net revenue in gold for 1909 was $922,458. After meeting four quarterly dividends at the rate of 6 per cent. per annum, $300,000 have been added to reserve, and $416,344 carried forward. The company acquired during 1909 a controlling interest in the Mexican Light & Power Co.

MEXICAN LIGHT & POWER CO.—The net revenue for 1909 was $2,426,811. From this the dividend on the 7 per cent. preference shares has been paid, and after paying 4 per cent. on the common stock, $149,386 are carried forward. When the works at the Tenango dam have been completed, the company will have a plant of 100,000 h.p. The carrying capacity of the high-voltage transmission lines has been increased to 100,000 h.p.

GENERAL ELECTRIC CO.—The annual general meeting was held on Tuesday under the Chairmanship of Mr. G. Byng. After referring to the low quotation on the Stock Exchange of their preference shares, which, he said, was the result of the action of certain outside brokers, the Chairman expressed satisfaction that at last the British Post Office had seen their way to encourage them in the manufacture of telephone apparatus. After being subjected to deep-rooted prejudice for many years, they had received an order for one of the most important telephone exchanges in the kingdom, and they had also nearly completed the installation of another Post Office exchange. Telephone apparatus was also being sold by the company in Australia and India, and, curiously enough, the prices which the British Post Office were now paying were lower by some 30 per cent. than the prices previously paid for foreign instruments. They were keeping the flag flying over their carbon works, although they were not showing a profit in face of foreign competition. They had been greatly encouraged by the policy now pursued by the Admiralty, but there was much to complain of in the action of many municipalities, who sent ratepayers' money abroad while many workers here were unemployed, and whilst it was a matter of almost national importance that the only carbon works in this country should be kept going. With regard to metal filament lamps, he regretted that their patent rights had been greatly infringed, and they had been compelled to take legal proceedings both on the master patent and upon minor patents. In conclusion, Mr. Byng pleaded for reform in our fiscal system, and urged the further extension of preferential duties with the Colonies.

NEW COMPANIES

NEW ELECTRICITY COMPANY OF MACCLESFIELD.—Capital £5,000 in £1 shares. To supply electricity in Macclesfield.

ACTON LAMP CO.—Registered by Burgess, Cosens & Co., 5 Laurence Pountney Hill, London, E.C. Capital £8,000 in 5,000 "A" and 3,000 "B" shares of £1 each. Manufacturers of and dealers in electric lamps, electrical apparatus, &c.

UITENHAGE ELECTRIC LIGHT & POWER CO.—71 Queen Victoria Street, London. Capital £15,000 in £5 shares. To take over from the General Electric Co., Ltd., a concession for the supply of electricity in Uitenhage, Cape Colony. The subscribers include Mr. Hugo Hirst, and Mr. A. I. S. Baron, of the General Electric Co., London, who are also on the Board.

ELECTRO-METALS, 22 College Hill, London, E.C. Capital £30,000 in 4,000 £5 shares and 10,000 £1 shares. Electrical engineers, metallurgists, &c. To adopt an agreement with Messrs. Jens Orten-Boving & Co.

NOKES & CANNON, Canning Street, Leicester. Capital £2,000. To acquire the business of electrical and mechanical engineers, carried on at the above address as "Clerk & Nokes."

WELDINGS, 80½ Lionel Street, Birmingham. Capital £1,500. Electrical, mechanical and civil engineers, and contractors, welders, manufacturers of electrical and other machinery and accessories, &c.

RIO DE JANEIRO SUBURBAN TRAMWAYS, 7 and 8 Poultry, London, E.C. Capital £1,000. To take over concessions for the construction of tramways and light railways in or near Rio de Janeiro.

OUDTSHOORN ELECTRIC LIGHT & POWER CO., 71 Queen Victoria Street, London. Capital, £15,000 in £5 shares. To supply electricity in Oudtshoorn, and to acquire a concession granted by the Council to General Electric Co., Ltd. Mr. H. Hirst and Mr. A. I. S. Baron, of the General Electric Co., Ltd., are on the Board.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

ELECTRICAL ENGINEERING

No. 187 [Vol. VI., No. 30] THURSDAY, JULY 28, 1910. [Price One Penny.
All rights reserved. *Registered as a Newspaper.*

"Electrical Engineering," although the Cheapest Electrical Paper (Price 1d. weekly), contains the Most Useful and Practical Articles, the Best Illustrations, and the Latest News. It is read by the Leading Electrical Engineers, and is regarded as a Reliable Authority in all matters connected with the Electrical Industry.

ELECTRICAL ENGINEERING.

The Engineering Journal of the Electrical Industry

Published every Thursday. Price **1d.**

SUBSCRIPTION RATES.

United Kingdom. 6s. 6d. per Annum.
Canada. 8s. 8d. per Annum.
Other Colonies and Abroad. 13s. per Annum.

Small prepaid Advertisements for Situations Vacant and Wanted, Articles for Sale and Wanted, &c., are inserted at the rate of One Penny per word, minimum One Shilling, three insertions for the price of two.

Official Notices and Technical College Announcements are inserted at the rate of Ninepence per line (column width).

Other Advertisement Rates on Application.

Latest Time for Receiving

Letters for Insertion, *Tuesday first post.*

Small Advertisements and Official Announcements, *Wednesday first post.*

Displayed Advertisements, *Tuesday first post.*

Corrections in Standing Advertisements, *Monday first post.*

All letters to be addressed to "Electrical Engineering," at the Editorial and Publishing Offices: 203-206, Temple Chambers, London, E.C.

Telegrams: "Circling, London." Telephone No.: 5509 Holborn.

Cheques to be made payable to The Kilowatt Publishing Co., Ltd., and to be crossed London County and Westminster Bank (Temple Bar Branch).

A Supplement "Electrical Engineering in Mines" is included (gratis) in "Electrical Engineering" on the first Thursday of every month.

SUMMARY

The London United Tramways Bill, relating to the tramways across Kew Bridge, which has already passed the House of Lords, was read a third time in the House of Commons on Tuesday.—The London Electric Supply Bill has passed the House of Commons, and was read a first time in the House of Lords on Monday. (Page 490.)

A letter from Mr. L. H. Walter refers to the success of the Bellini and Tosi "wireless compass" equipment for locating the position of ships in fog. Mr. W. P. Durtnall writes with reference to his opposition to a patent of Hon. C. A. Parsons. (Page 491.)

The chief electrical feature at the exhibition of the British Medical Association is an apparatus for a new high-frequency treatment. A comparatively large oscillating current is passed through the body, and the heating effect is claimed to be highly beneficial in cases of rheumatism, gout, &c. Further, a current of between two and three amperes from this apparatus may be used for destroying diseased tissue through coagulation. (Page 492.)

An article by Mr. C. C. F. Monckton describes some experiments on the radiation from a wireless telegraph aerial under different conditions. (Page 492.)

Electric power is extensively employed in the works of the Barrow Hematite Steel Co. at Barrow-in-Furness. The various shops, the machinery in the iron works and on the rail banks, the blast-furnace hoists, pumping and other plant are electrically driven, and in all some 120 motors are installed, aggregating about 2,500 h.p. Power is generated by three large gas-engine sets running off blast-furnace gas, and is distributed at 220 volts direct current on the two-wire system by means of bare overhead cables. The auxiliary plant in connection with the gas-engine sets, the main switchboard, and the overhead cable lines, have many interesting features. (Page 493.)

Messrs. Mordey & Dawbarn have presented a report to the Torquay Corporation in which they express the opinion that the Dolter surface contact system now in use in Torquay can be made to work satisfactorily by the substitution of improved studs at a total cost of £6,500. (Page 496.)

A new line of quick-break knife switches with the wearing parts of steel to ensure durability has been introduced. (Page 497.)

Among the specifications published by the Patent Office on Thursday last was one by A. F. Berry for an automatic switch for house transformers. The transformer is connected with a reactance in series, and this is short circuited automatically directly any current flows in the secondary circuit.—M. B. Field covers a method of protection for three-phase feeders: the system is earthed through a high resistance, and the switches are operated by relays supplied from current transformers which supply current when the balance of the phases is disturbed.—The application of the Crompton auto-converter to the control of motors

Digitized by Google

is described in another specification.—Opposition has been entered to the grant of a patent relating to the balancing of the axial thrust in steam turbines. (Page 498.)

THERE has been a net loss of £2,029 on the Bristol Electricity Department, which is covered by cash brought forward from the previous year.—Meters are to be used as a current check on tramcars at Cardiff.—The Heston & Isleworth Electricity Committee are making arrangements through contractors for the engagement of canvassers.—It is expected that the Hull telephone system will not be taken over by the Post Office at the time of the transfer of the National Telephone Company's undertaking.—The double trolley line from Eltham to Woolwich has been opened for traffic.—The Southport electricity undertaking shows a net profit of £1,475. (Page 499.)

LOCAL GOVERNMENT BOARD inquiries have been held for loans at Aston (£23,500); and Torquay (£3,500). Extensions are also contemplated at Leicester (£19,190), and Walthamstow (£1,834). A loan of £35,933 is also to be applied for, for tramway extensions at Rochdale. The Frodingham Council have decided to use electricity for street lighting. (Page 499.)

THE accounts of the Metropolitan Railway Co. show an increase of receipts of £12,000 over the previous half-year, and an increase in expenses of only £776. The report of Messrs. Crompton & Co. records a loss of £20,493. The directors, however, are of the opinion that, by exercise of rigid economy, a profit can be earned. (Page 502.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY), THURSDAY, JULY 28TH.

The Institution of Mechanical Engineers and the American Society of Mechanical Engineers. Joint Summer Meeting.

Excursion to Rugby to visit Messrs. Willans & Robinson's and the British Thomson-Houston Co.'s works.

9 p.m. Conversazione at the Institution, Storey's Gate.

FRIDAY, JULY 29TH.

10 a.m. At Institution of Civil Engineers, Westminster:—"Electrification of Suburban Railways," by Mr. F. W. Carter; "Cost of Electrically-Propelled Suburban Trains," by Mr. H. M. Hobart; "Economics of Railway Electrification," by Mr. William B. Potter; "Electrification of Trunk Lines," by Mr. L. R. Pomeroy; "Electrification of Railways," by Mr. George Westinghouse.

The Sinking of the Pluviose.—The *Times* correspondent states that during the work of refitting the ill-fated French submarine Pluviose, which sank due to a collision off Calais, traces of fire were discovered in the interior, which are suggested to have been due to a short circuit in the electrical equipment.

Wireless Telegraphy.—In the House of Commons on Thursday, Colonel Seely stated that the Australian and New Zealand Governments had taken space to establish high-power wireless telegraph stations at Sydney and Doubtless Bay, but it had not yet been possible to carry out the recommendations of the Conference of Australasian Governments with regard to the Pacific Islands.

A fire broke out on Friday on board the Southern Pacific steamer *Momus*, bound from New York to New Orleans, when off the coast of Florida. Assistance was called for by wireless messages, and the 86 passengers on board were transferred to the ss. *Comus*, of the same line, without mishap.

In reply to a question in the House of Commons on Monday, Mr. H. Samuel stated that the following wireless stations could be used by ships sailing between England and India: North Foreland (Kent), Niton (Isle of Wight), Bolt Head (Devonshire), Lizard (Cornwall), Seaforth (Liverpool), Rosslare (Wexford), Crookhaven (Kerry). A station has been recently opened at Bombay, and two stations at Port Said and Port Tewfik belonging to Lloyd's are open for communication with ships on matters relating to navigation. There are also Government stations at Gibraltar, Malta, and Aden, which, though not open for general purposes, would communicate with ships in case of distress. The question of opening stations at Gibraltar, Malta, Aden, and other places for general communication with ships is under consideration. The stations working east of Aden are under the control of the Admiralty.

PARLIAMENTARY INTELLIGENCE

LONDON UNITED TRAMWAYS.—This Bill, which has already passed the House of Lords, and was sent forward for third reading by the Unopposed Committee of the House of Commons, was read a third time in the House on Tuesday. The chief proposal is to extend the powers granted in 1909, for constructing tramways across Kew Bridge. At that time the company agreed not to use the overhead system, but an arrangement has now been made with the Richmond Corporation whereby the overhead system may be used, upon certain conditions.

PROGRESS OF ELECTRICAL BILLS.—The Metropolitan District Railway Bill, which has already passed the House of Lords, was read a third time in the House of Commons on Thursday.

The London Electric Supply Bill was read a third time in the House of Commons on Thursday, and for the first time in the House of Lords on Monday.

The Rhondda Urban District Council (Tramways Extension, &c.) Bill, and various other Corporation Bills were read a third time, and passed in the House of Lords on Monday.

ELECTRIC LIGHTING PROVISIONAL ORDERS.—The Electric Lighting Provisional Order (No. 2) Bill, which confirms a Provisional Order granted to Mr. George Balfour for Ardrossan, Saltcoats, and Cambuslang, was before a Select Committee of the House of Lords last week. The only opposition was by the Caledonian, Glasgow, & South-Western & Lanarkshire & Ayrshire Railway Companies, who asked for a clause protecting them from liability in respect of damage to electric mains carried over their bridges. The Committee refuse to insert the clause asked for.

L.C.C. TRAMWAYS.—The London County Council (Tramways and Amendments) Bill has been before a House of Lords Committee during the week. The Bill has already passed the House of Commons. Of the proposals originally contained in the Bill, eight were struck out by the Standing Orders Committee, on the ground that the consents of the Road Authorities concerned have not been obtained. The proposals passed, the remainder of the Bill, although meeting with some opposition, was passed by the Committee, and provides for an extension of the tramway system in various parts of London. Among the clauses in the Bill is one for the protection of Greenwich Observatory, which gives the Admiralty absolute veto in respect of any tramways which may be deemed likely to affect injuriously any apparatus at the Royal Observatory. The Admiralty, before the House of Commons, refused to agree to a suggestion that "reasonable and proper precautions" should be taken by the Council. The Council is given powers to apportion between the Tramways and Improvements account the cost of all street improvements, and the ratification of past apportionments. A point was raised before the House of Commons Committee that tramways ought not to be sanctioned where there would be less than 9 ft. 6 in. between the kerb and the nearest rail, but it was not pressed except in a few particular cases. The Highways Committee, reporting upon others, stated that if these conditions were insisted on, it would render the cost of reconstructing existing tramways, and of constructing tramways almost prohibitive. Before the House of Lords, the Bill is opposed by the City of London Corporation, Lambeth Borough Council, the Metropolitan Water Board, and owners and occupiers of premises in Tooley Street, all of whom were heard by the House of Commons Committee. With regard to the opposition of the Lambeth Borough Council, this was to the effect that the Dulwich Road was not wide enough for a double line, and Mr. Stephen Sellon gave evidence in support of this contention. The Committee decided that the road should be widened at the joint cost of the County Council and the Borough Council. If the two parties cannot agree as to the amount to be paid by each, the Committee will fix the proportion.

Damages for Tramcar Accident.—Mr. E. Jackson, of Hackney, has been awarded £415 damages against the London County Council in respect of serious damage to health and loss of wages arising out of a collision between a tramcar in which he was travelling and another car at Clerkenwell in November last.

Telegraph Traffic and Movements of Cable Ships.—The cable between Madagascar and Reunion was restored on 18th inst.—The lines of the Indo-European Telegraph Co. were interrupted between Kertch and Soukounn and Kale on the 22nd inst., but were repaired on the same day.—The new cable between Ascension and Buenos Aires belonging to the Western Telegraph Co. is 3,186·5 nautical miles in length.—The cable ship *Mackay-Bennett*, of the Commercial Cable Co., and the *Contre Amiral Caubet*, of the French Cable Co., remained at their moorings during June, and the c.s. *Minia*, of the Anglo-American Telegraph Co., was working on one of the cables of the Western Union Telegraph Co. The *Robert C. Clowry*, of this latter company, has been engaged in repairing one of its short sections, and has returned to New York.

CORRESPONDENCE

WIRELESS TELEGRAPHY AT SEA.

To the Editor of Electrical Engineering.

Sir,—I have read with interest your editorial in this week's issue dealing with the Compulsory Wireless Telegraphy Bill, and note that yours is the first journal to appreciate that wireless methods have advanced to such a degree that a further and very important service can now be rendered by Hertzian-wave transmission, over and above what is afforded by wireless telegraphy pure and simple—and that is, the facilitation of navigation during fog. It appears to the writer that while so much stress is laid upon the necessity of equipping ships with a wireless outfit which enables messages to be sent summoning assistance *after* a disaster has occurred, not enough emphasis has been laid upon the advantage of possessing a means of *avoiding* accident, or, at any rate, of very greatly reducing the risk of collision, &c., in time of fog. You have referred to the fact that there already exists a practical wireless compass arrangement for aiding navigation during fog; and as, so far as I am aware, there is only one such device at present, namely, that of Messrs. Bellini and Tosi, I think that a few particulars of the results obtained therewith may prove of interest to your readers, especially as nothing has as yet been published in the technical press.

S.S. La Provence, showing Bellini & Tosi "Wireless Compass" Aerial.

The Bellini-Tosi wireless compass equipment has been in use for some months on the s.s. *La Provence*, of the Compagnie Générale Transatlantique, and other liners of the same company are being equipped. I am sending you herewith a photograph of the *Provence*, from which it can be seen that the encumbrance caused by the aerial gear is nothing to speak of, while the arrangement can be fitted to any existing wireless telegraph system. For instance, the compass has been added to the ordinary Marconi installation already fitted. Her captain (Capt. Poucelet) has declared that the installation of the compass equipment increases the safety of navigation by 100 per cent., and he further considers that collisions at sea may be entirely averted by this system of wireless detection. In view of these results, it appears that those responsible for the introduction of the Bill would have shown more consideration for the safety of the passengers had they advocated the adoption of wireless telegraphy in conjunction with a device by which most mishaps could be avoided. To consider the fitting of a wireless installation for communication purposes only as being sufficient is practically equivalent, to take an analogy from another source, to providing a railway train with a telephone system by which it would be possible to signal that an accident had occurred, and yet neglecting to provide the ordinary signals for indicating the presence of an obstruction on the line.

London, S.W.
July 23rd, 1910.

I am, &c.,
L. H. Walter.

ELECTRICAL MARINE PROPULSION.

To the Editor of "Electrical Engineering."

Sir,—In your report of my opposition to the sealing of the Hon. C. A. Parsons' patent, in your issue of the 21st inst., there are certain inaccuracies which I trust you will allow me to correct.

You state—"Mr. Durtnall claimed to have a master patent for a polyphase electrical speed reduction system for this purpose, but the Comptroller does not consider this to be the case."

This particular point was one which I was not allowed to press, as I had not filed a notice thereof within the prescribed time allowed by the Rules of the Patent Office. As a consequence, the hearing, and the decision, were mainly concerned with the terms of the disclaimer, which is to be inserted in the Parsons' patent.

In your report you state that the Comptroller did not consider "any" reference or disclaimer should be inserted, and you follow this up with, "An amendment of little importance has been made at the suggestion of the applicants, however."

As a matter of fact, the applicants were obliged to alter the general disclaimer in the preamble of their specification, so as to make it clear that they were aware that it had already been proposed to use polyphase alternating current electrical machinery in connection with turbines for the purpose of marine propulsion, and as I was the first to make that proposal in my patent, No. 17248 of 1905, this amendment (made on my suggestion and not on the suggestion of the applicants) amounts to a disclaimer of my invention, the specific reference by number not being allowed because of a legal technical error, on my part, in patent opposition procedure.

This disclaimer by the applicants is, therefore, a matter of very much more than "little importance," particularly as my claim to the exclusive right of using a polyphase alternating-current speed reduction system for self-contained ship propulsion, will be revived as against another proposed infringement, within the course of a few weeks.

I am, Dear Sir,
Yours faithfully,
William P. Durtnall.

11 Bush Lane, E.C.
July 23rd, 1910.

P.S.—As regards your mention of patent No. 21,050 of 1900, I might here point out that this patent refers to a railway system "with sub-station," and it has since been decided that same ought not to have been mentioned in this connection, so your remarks that the Comptroller-General holds that my arrangement was not new at the time of my application in 1905, does not, therefore, stand good to-day.—W. P. D.

[In the Parsons' specification, reference was made to the previous "use of one or more steam turbines driving alternators to supply current to motors driving, or assisting to drive, the propeller shafts of a ship," and as Mr. Durtnall complained that this does not include a reference to his polyphase system, even though the word alternator occurs, it has been agreed that the words "single or polyphase" shall be inserted before "current." Further, the fifth claim of the patent is to be amended. This reads as follows:—"Combined turbo-electric ship propelling machinery comprising one or more turbines driving one or more electric generators interwound with one or more electric motors, whereby the turbines may run at a higher speed than the propeller shafts." The amendment consists in inserting "as in claims 1 and 2" after "motors"; claims 1 and 2 describe the method of interwinding the generators and motors. With regard to the B.T.-H. Co.'s patent, referred to by the Comptroller in his decision, it appears that this is for a polyphase system of railway control, with a motor on the vehicle supplied from generators with different numbers of poles. The generators are not on the vehicle, however, and Mr. Durtnall claims that he has a master patent for the self-contained system used on a boat or vehicle as a polyphase speed reduction gear.—Ed. E.E.]

RADIATION FROM A WIRELESS TELEGRAPH AERIAL

By C. C. F. Monckton

THE surging current in an aerial circuit has sometimes been called the radiation current. It does not necessarily follow, however, that by increasing this surging current the radiation is increased. It was brought to the notice of the writer by Mr G. Barratt, the wireless operator at Tobago, that when using two sparks in series in an aerial circuit, a better spark could be obtained by placing a small helix of wire in contact with the central knob. Further trials were made. First the surging current was read under the normal conditions of sending, and then the helix, consisting of six turns of No. 20 wire, 1 in. diameter, was placed as shown in Fig. 1. The current rose from 1·5 to 1·75.

Next a large coil, having a fairly large capacity, was placed in the same position; the current rose to 2·4. The final test was

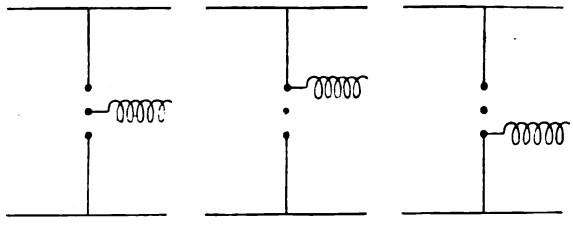

FIG. 1. FIG. 2. FIG. 3.

to transmit under the new conditions. Very little radiation was taking place, and the signals received at a station 60 miles distant were unreadable. To make certain that the increase of current was not merely apparent—due to displacement of the antinode—the large coil was placed in the positions shown in Figs. 2 and 3; the current readings were 1·4 and 1·2 respectively. The spark-gaps were each $\frac{1}{8}$ in., and the current from the induction coil was about the same throughout the experiments.

There is no doubt that the appearance of the spark, using multiple gaps, is improved; but the above experiment has led the writer to consider whether it is not possible that the real advantage may be fictitious. Further experiments seem necessary

NEW ELECTRO-MEDICAL APPARATUS

THOSE of our London readers who are interested in the applications of electricity to medicine and surgery should pay a visit to the electrical section of the Exhibition of the British Medical Association at the Imperial Institute, South Kensington, which is open to-day and to-morrow until 6 p.m. The chief feature of interest is an apparatus for a new high-frequency treatment known as Diathermy, or Thermo-Penetration, from which important results are being obtained. The treatment consists in passing a comparatively large undamped oscillatory current through the body, thus producing considerable internal heating, without any chemical or nerve-irritating effect. This heating is claimed to be highly beneficial in rheumatism, gout, and similar troubles, and if concentrated and carried to the proper degree can be caused to effect a complete destruction of diseased tissue through coagulation. Cases of tumours, cancer, and lupus have been treated; for example, a tumour or abscess can be coagulated and rendered inactive before removal, thus preventing the infection of the surrounding tissues.

The apparatus, which is exhibited by Messrs. Siemens Bros. & Co., Ltd. (Caxton House, Westminster, London), includes an oscillatory spark-gap similar to that employed in the Telefunken system of wireless telegraphy, and consisting of a series of copper discs with annular separators of thin sheet mica. This gap is connected in an oscillatory circuit supplied from a transformer, and the oscillations produced are transformed up to the required high pressure of several thousand volts by means of a Tesla air transformer. The current has a frequency of from 600,000 to one million cycles per second, and is applied direct to the patient through metal handles or suitable electrodes. For curative purposes, a very small current is used, and this produces a pleasant and beneficial warming owing to the high internal resistance of the body. For coagulation, a current as large as 3 amperes is employed, this being concentrated by the use of a small electrode near the diseased part. There is no tingling sensation and no danger of shock. The illustration of Fig. 1 shows the spark-gap, and high-frequency ampere-meter mounted on a portable stand. In the box are the low- and high-frequency transformers and the oscillatory apparatus. The removal of electrodes from the body whilst current is passing should be avoided, as otherwise the intense sparks produced would cause severe burns. Regulation of the current may be effected by adjusting a resistance in the primary circuit, or by

FIG. 1.—DIATHERMY APPARATUS.
(*Siemens Bros. & Co.*)

altering the coupling between the primary and secondary of the Tesla transformer.

A similar apparatus to the above, but employing a spark-gap of a different form, with two heavy electrodes enclosed in a chamber filled with alcohol vapour, is shown by Messrs. K. Schall & Son (75 New Cavendish Street, London). A current of 0·5 ampere at 5,000 volts from this apparatus produced a pleasant internal heating in less than one minute, without any unpleasant sensation.

FIG. 2.—X-RAY OUTFIT.
(*Siemens Bros. & Co.*)

Among the other apparatus exhibited were a large selection of heavy spark coils for X-ray work, including the complete Siemens outfit illustrated in Fig. 2, and comprising a 15-in. coil with Wehnelt interrupter, resistances and switches. The protecting screen enables the physician to regulate the tube and observe the patient without being subjected to the harmful effects of the X-rays. A fine single-flash coil, with which some excellent instantaneous photographs of the heart have been taken, is exhibited by Messrs. K. Schall, and a large selection of coils and heavy current tubes for instantaneous work is shown by a number of other firms, including the Sanitas Electrical Co., the Medical Supply Association, W. Watson & Sons, Siemens Bros. & Co., and H. W. Cox & Co. The last-named firm exhibit a new type of mercury interrupter for heavy currents. Regulation of the current is effected by varying the arc of contact between the mercury jets and a fixed blade, and the inverse current in the coil is reduced to a minimum by introducing a large resistance at the moment the circuit is made. A mercury interrupter on a new principle, with neither jets nor paddles, is shown by the Sanitas Electrical Co., who also show an outfit for instantaneous radiography (1/100 second exposure) with a mercury interrupter. Special motor-generators, with the generator winding isolated from the motor winding to avoid any possibility of shock, are exhibited by several firms. Messrs. F. R. Butt & Co. show a new interrupter with magnetically-produced rotation of the mercury.

Theft of Electricity.—A charge of stealing electricity was preferred against J. F. Churchard, of Second Avenue, Trafford Park, at the Manchester Police Court last week. The Trafford Power & Light Supply, Ltd., have installed a number of slot meters on the estate, and it was alleged that the defendant manipulated the meter by inserting a wire, and so obtaining his supply of electricity without payment. The defendant admitted having inserted a wire, but said he had done so because he could not get any light after having inserted one of the tokens supplied by the Company. A fine of 20s. and costs was imposed.

THE BARROW HEMATITE STEEL WORKS

THE works of the Barrow Hematite Steel Co., Ltd., are situated at Barrow-in-Furness, within five miles of the extensive hematite iron mines owned by the company in that district, and cover an area, including railway sidings and reservoirs, of over 245 acres. A better idea of the size of the works, however, will be gathered from the fact that the number of employees, exclusive of those at the mines, is over 3,500. The equipment of the works comprises ten large blast furnaces, and a considerable number of hot-blast stoves; a Bessemer shop containing four 20-ton converters; a Siemens melting shop with four 50-ton furnaces; cogging, roughing and finishing mills; slabbing, plate and rail mills; five foundries, and a number of engineering shops. The whole of the iron works, engineering shops, hydraulic pumps, and rail bank machinery have now electric drive, but as yet none of the rolling mills are electrically driven. Electric power is generated in a central station in the works, containing gas-engine sets driven with blast-furnace gas, and is distributed by overhead mains. Through the courtesy of the manager, Mr. A. J. While, we were recently given the opportunity of inspecting the plant, and the chief engineer, Mr. Augustus While, who was solely responsible for the installation of the electric plant, kindly conducted our representative over the works, and supplied him with the substance of this article.

Though there are ten blast-furnaces in all, only six are in blast at present. From these the gas passes through water-sealed valves to four large dust-catchers, and from the dust-catchers through a long line of tubing to the gas-fired boilers, where the gas main is tapped to supply these; the remainder of the gas (a small portion of the whole) is delivered to the washer house. The final cleaning of the gas for the power-house engines is here carried out by five Theisen rotary washers, each dealing with 150 c.m. of gas per minute, and direct-coupled to a 70 h.p. shunt-wound G.E.C. motor running at 440 r.p.m. Besides the washers, this building contains two electrically-driven centrifugal pumps of 15 h.p. each, and an overhead five-ton, three-motor travelling crane. From the washer house the gas is conveyed to the engine house, a distance of 210 ft., in a 10-ft. pipe.

The engine-house building is 261 ft. long, 85 ft. wide, and 44 ft. high, and is served by two electric travelling cranes of 45 and 15 tons capacity respectively. It contains five blowing engines, and three electric generating sets. Two of the blowing engines are of the "Nürnberg" design, and were constructed by the Lilleshall Engineering Co., while the other three were made by the Gutehoffnungshütte Co. All these engines run at 90 r.p.m., and are capable of blowing 26,000 cubic feet of air per minute at a pressure of 8 lbs. per sq. in. The three gas engines of the generating sets were supplied by Messrs. Richardsons, Westgarth & Co., Ltd., and are of the "Cockerill" double-acting tandem type. One of these runs at 100 r.p.m., and is rated at 1,250 b.h.p., and the remaining two at 125 r.p.m., and rated at 750 b.h.p. Fig. 1 is a general view of the engine-room; the blowing engines can be seen in the background, and two of the generating sets in the foreground. The complete plant has now been running for eighteen months, and is giving every satisfaction. The substitution of the gas engines for steam plant has resulted in a saving of 1,500 tons of coal per week.

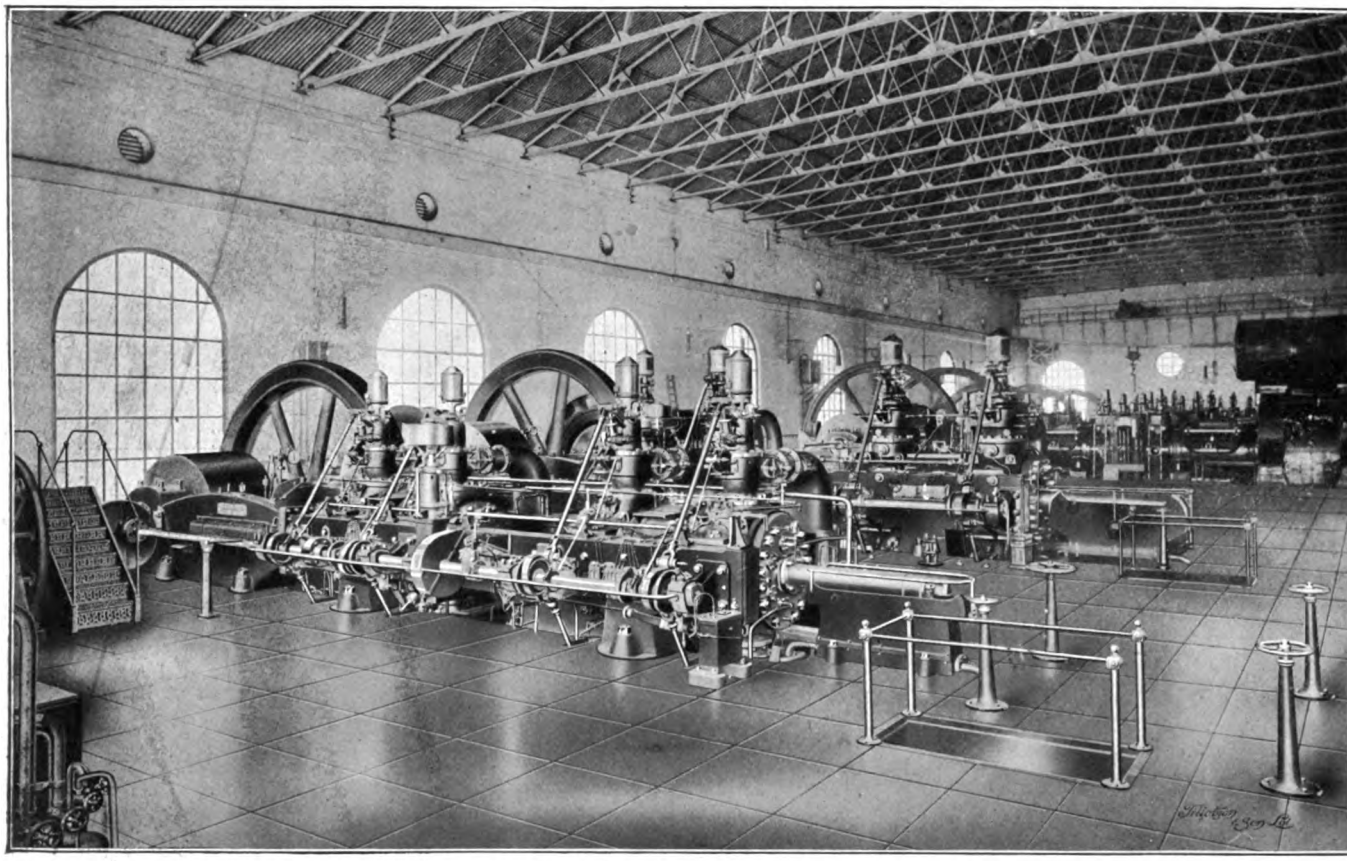

FIG. 1.—GAS-ENGINE ELECTRIC GENERATING AND BLOWING SETS RUNNING OFF BLAST-FURNACE GAS. BARROW HEMATITE STEEL WORKS.

Digitized by Google

All the eight gas engines are provided with low-tension ignition with electromagnetic tappets; there are two plugs at each end of the cylinders. Current is supplied from one of two alternative 80 ampere-hour 30-cell Chloride batteries. The ignition circuits for the several engines are controlled from the battery switchboard. The storage batteries are under a rigorous system of supervision; each cell is tested for voltage and specific gravity every week. Two of the blowing engines are equipped with small governors which break the ignition circuits when the speed exceeds the normal by 5 per cent.; the gas supply is regulated by hand according to the load. All the other engines are provided with "Hartung" governors controlling the gas valves. All the engines are equipped with electrical barring gear, consisting of a motor of 8 or 12 h.p., according to the size of the engine, driving a pinion through worm gearing. Starting is effected with compressed air from receivers in the cellar containing air at a pressure of 220 lbs. per sq. in. Two electrically-driven compressors are installed, the larger of which, a geared horizontal type compressor, is driven by a 50-h.p. motor. The other is a horizontal compressor driven by a 30-h.p. motor.

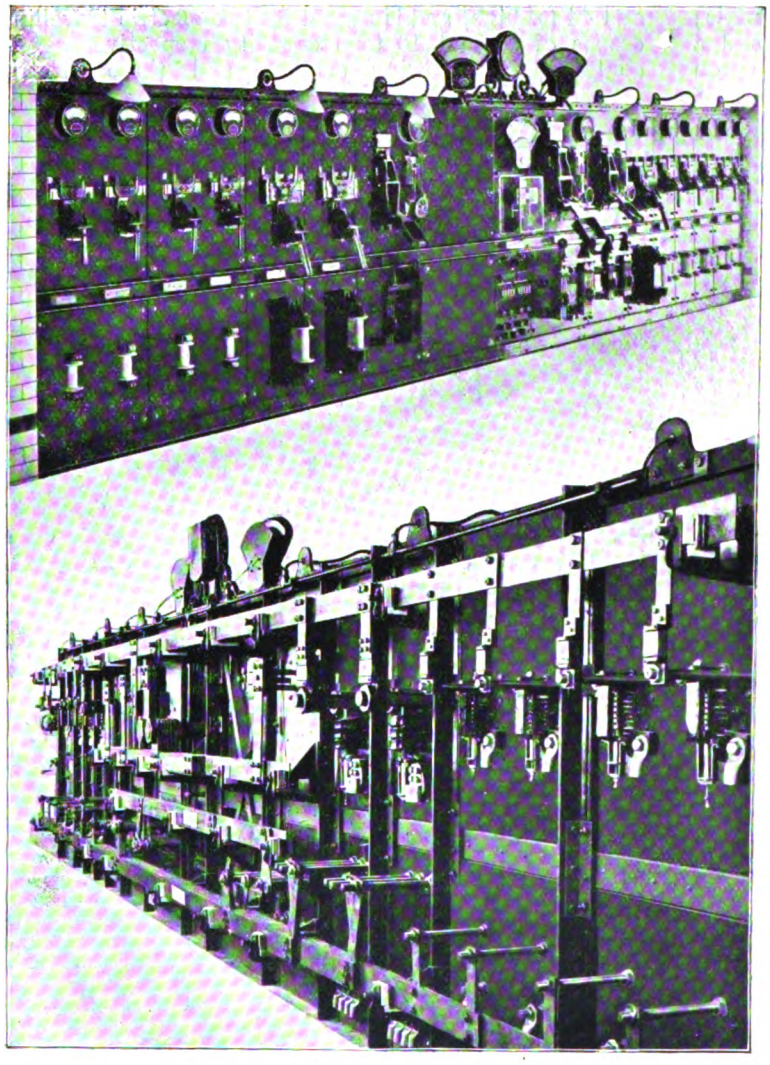

FIG. 2.—FRONT AND BACK VIEWS OF MAIN SWITCHBOARD.

An interesting part of the generating plant is the provision for water-cooling. The water, which is circulated through the jackets, valves, pistons, and piston-rods, is supplied from elevated tanks on either end of the building. The tank supplying the jackets is 46 ft. above the engine-house floor level, and that supplying the pistons 100 ft. From the engines, the water flows to reservoirs, from which it is pumped to the tanks again by electrically driven pumps. The high-pressure (40 lbs. sq. in.) water is dealt with by a centrifugal pump with a capacity of 16,000 gallons per hour driven by a 24-h.p. motor, and a pump with a capacity of 50,000 gallons per hour, and driven by a 40-h.p. motor, supplies the low-pressure (22 lbs. sq. in.) tank. Reserve sets are provided in each case. Each tank is provided with a float in connection with a row of five contacts at intervals of one foot. A seven-core cable connects the contact device with an indicator in the pump-house, there being an indicator for each tank. By looking at these indicators, the water-level in either tank can be ascertained. Further, should the water level sink below a certain level, a bell is rung to warn the attendant, who immediately switches on one of the pumps.

The three D.C. generators, direct-coupled to the "Cockerill" engines, were supplied by the General Electric Co., Ltd., and are remarkable in view of their enormous commutators. The two smaller generators are rated at 510 kw., 125 r.p.m., and the larger at 1,000 kw., 100 r.p.m., and all generate at 230 volts. All three machines are compound wound and provided with diverters to regulate the compounding effect.

The main switchboard, illustrated in Fig. 2, was built by Messrs. Veritys, Ltd., to Mr. A. While's specifications. It is arranged on a platform three feet above the floor level, and consists of 14 double panels controlling the three generators, three 2,000 amp., three 1,000 amp., and six 500 amp. distribution circuits. The 10,000 amp. 'bus-bars are carried on porcelain insulators supported on cast-iron brackets, as shown in Fig. 3. Connections are made by copper strip bolted to switch and instrument shunt terminals in such a manner that the current density at the contact surfaces nowhere exceeds 400 amps. per sq. in. Each circuit has an overload circuit-breaker on one pole and a hand-grip fuse on the other. The fuses consist of a number of wires in parallel enclosed in an asbestos-lined porcelain tube open at both ends. On the central panel is a B.T.-H. 10,000 amp. 230-volt total output meter, an illuminated dial ammeter reading up to 10,000 amp., and on either side of the clock above this panel are the illuminated dial 'bus-bar and paralleling voltmeters. Each of the generator panels includes a double-pole knife-switch on the negative side, one pole of which is in the equalising bar circuit; a reverse-current circuit-breaker in the opposite pole to that of the knife-switch; an ammeter, shunt regulator wheel, and voltmeter plugs. The provision of a switch in the equalising circuit, mechanically coupled to the main switch, ensures safe paralleling of the machines irrespective of the sequence in which the switches are closed. The main and equalising bar connections from the machines to the board are in the basement, and consist of copper rods of circular section supported at intervals on porcelain insulators. The insulators are carried on wooden supports hung from the ceiling of the basement. A board is placed on either side of the rods, and the trough so formed is covered top and bottom with expanded metal as shown in the section given in Fig. 4. In conjunction with this board is an auxiliary panel affording interconnection with a small steam-driven generating plant at the other end of the works, from which a limited amount of power can be taken in the event of the shut-down of all the blast-furnaces, and from which the gas-engine auxiliaries are supplied.

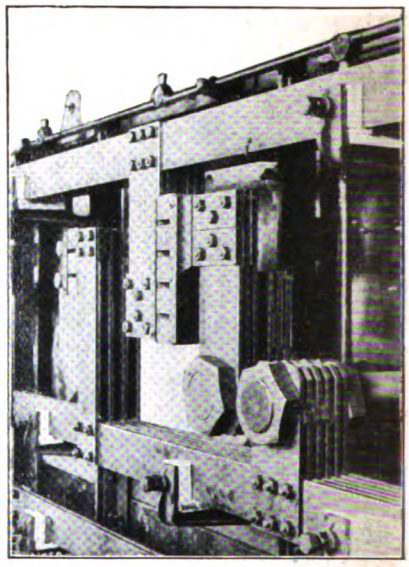

FIG. 3.—10,000 AMP. 'BUS-BARS AND MAIN WATTMETER CONNECTION AT BACK OF BOARD.

A careful record of the cleaning and repair work in connection with the gas-engine plant, and also of the electrical plant, is kept. Thus, there is a special log-book for the gas engines, and by reference to this the date of the last cleaning of any particular engine, or the duration of a shut down for any purpose, can be readily ascertained.

Before leaving the station, it may be mentioned that there is a special motor-generator set for supplying current at 100 volts for welding purposes. This consists of a Crompton compound-wound interpole motor coupled to a 60-kw. generator.

Digitized by Google

The accompanying plan (Fig. 5) gives a good idea of the arrangement of the works and the distributing mains. Current is distributed at 220 volts on the two-wire system, the adoption of this method being decided on after much consideration. A very large number of motors for this pressure were already in use in the

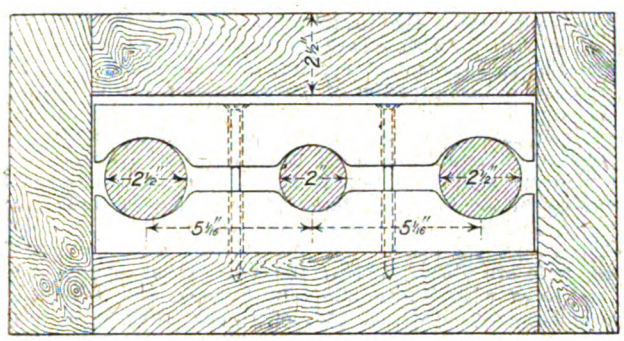

FIG. 4.—SKETCH OF PORCELAIN INSULATORS AND CARRIER FOR MACHINE CONNECTIONS.

works when the present system was designed, and further, the use of a low pressure was thought desirable, as experience had shown that motors could then be put down very rapidly, and without elaborate precautions, for temporary work. It was also thought

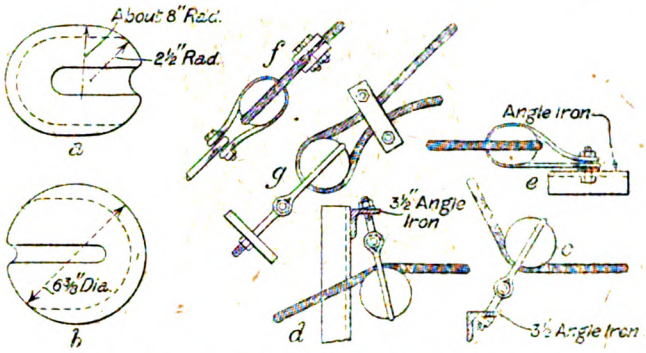

FIG. 6.—PORCELAIN INSULATOR FOR OVERHEAD CABLES.

undesirable to adopt the three-wire system, partly in view of the manner in which the motors are scattered about over a large area, rendering satisfactory balancing on the two sides of the system very difficult.

Distribution is effected by bare stranded copper cables or solid wires, carried overhead on wooden poles. Only one pattern of insulator is used. This is of porcelain and is illustrated in Fig. 6; *a* and *b* are two views of the size employed for 91/12 cable, and the other sketches indicate the various methods of using it. All the cables are strung up as shown, and since they were erected two years ago, no trouble has been experienced from slackening due to expansion. The cables pass under or over the insulators, as shown by *c* and *d*, according to circumstances, the insulators being attached by steel strips to the cross-arms of H-type wooden pole supports. The method of attachment at angles is shown by *e*, and *f* and *g* illustrate an anchor-

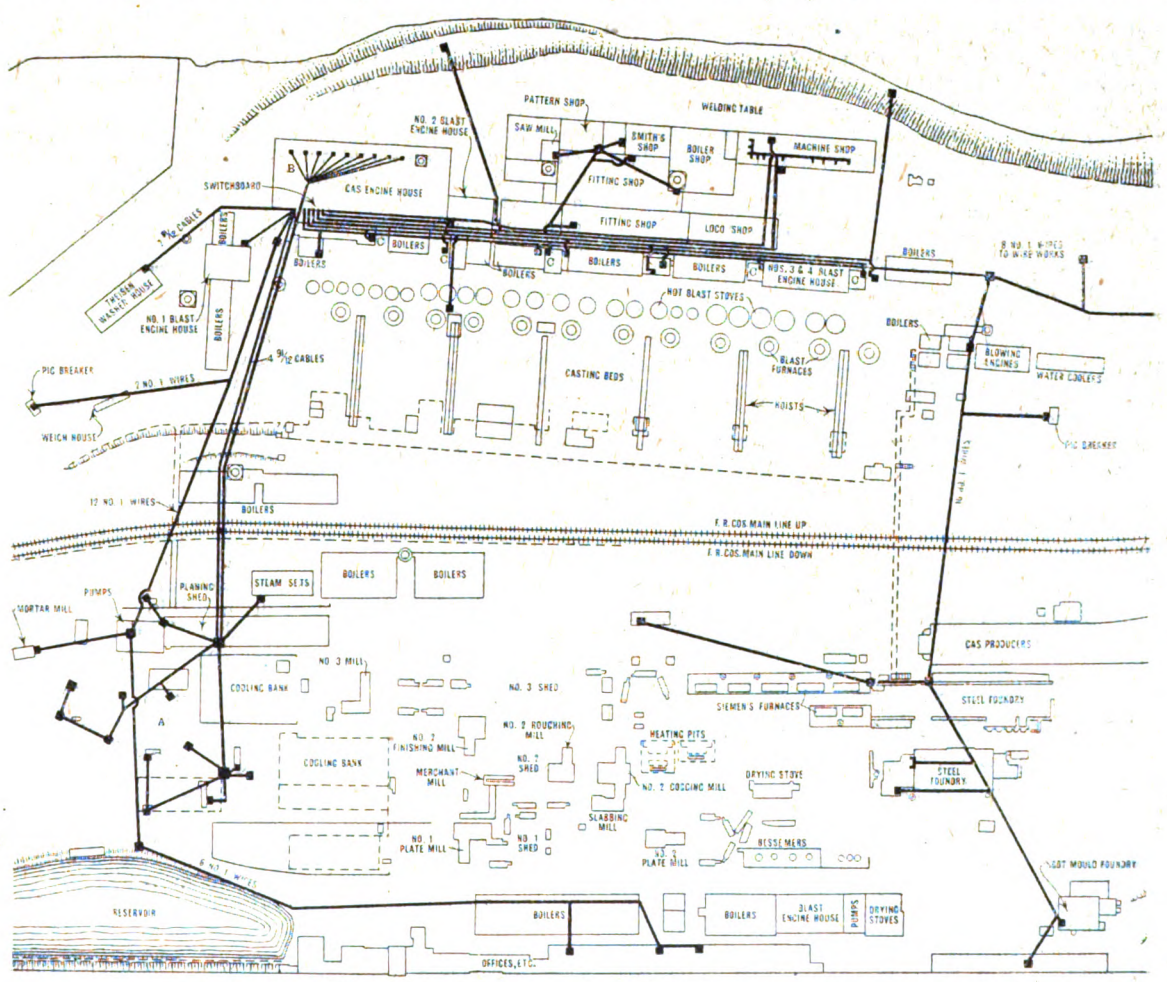

FIG. 5.—GENERAL PLAN OF BARROW HEMATITE WORKS, SHOWING MAIN DISTRIBUTION CABLES.

age at the end of a cable. In this case, the cable is passed round the insulator and fastened by means of two brass clamping pieces bolted together.

From the main switchboard a group of fourteen feeders, ten 91/12 and four 37/12 cables run out to the various motor-driven machinery in the iron works. These include drilling, shaping, and planing machines,

Digitized by Google

circular saws, crane motors, lathes, pumps, the blast-furnace hoists, and pig-breakers. The motors of these machines are of various makes, including Messrs. Crompton Co., the Lancashire Dynamo & Motor Co., J. P. Hall & Co., Lahmeyer Electrical Co., and the General Electric Co., and number over fifty, aggregating some 1,000 h.p. The blast-furnaces are each over 60 ft. high, and are arranged in pairs in a row, as shown in the plan. The material is hauled up from the ore sheds to the tops of the furnaces in trucks running on an inclined road, there being one hoist for each pair of furnaces. Each of the five haulage gears, *C*, is driven by an 80 h.p. Lahmeyer interpole motor, provided with a 15-step lever controller, affording gradual speed control from 20 r.p.m. up to the full speed of 250 r.p.m. The pig-breaker is a machine comprising a reciprocating table which brings the pigs under breaking rams. This is operated by three motors of 10, 5, and 1½ h.p. respectively.

In the steel works proper there are some twenty motors, aggregating 370 h.p., and driving mixing, mortar, and other mills, lathes, cranes, and other machinery. Further, there are fifteen motors, aggregating some 160 h.p., and mostly of the Lancashire Dynamo & Motor Co.'s make, in use at the rail banks at *A*. These drive straightening machines, drilling machines, presses, rail-ending machines, and cold saws, and are supplied from the central station through twelve No. 1 wires. Besides this line, however, this part of the works, in which is situated the steam-generating station, is connected with the central station by four 91/12 cables. By this means the iron works could be supplied from the steam station. The various auxiliaries *B* in the gas-engine station, including crane motors, barring gear, compressors and pumps, and aggregating some 350 h.p., are supplied over this line from the steam station.

Apart from the various pumps already mentioned, there is a pumping plant comprising two large reciprocating pumps, driven by Mather & Platt 130 h.p. compound-wound motors, and two smaller pumps.

There are in all some 120 motors in use in the works, aggregating about 2,500 h.p. Besides those already mentioned there are motors by Messrs. Dick, Kerr & Co., Bruce Peebles, Electric Construction Co., and other firms. In most cases the starters and regulating gear were supplied by the makers of the motors; several examples of the "Igranic" gear, manufactured by the Adams Manufacturing Co., are in use, as well as some supplied by Messrs. Veritys, in connection with the Theisen washers.

The lighting of the works is carried out chiefly by arc lamps, of which there are 150 of the Crompton open, and Westminster Engineering Co.'s enclosed types. There are also some 1,000 incandescent lamps in use.

SURFACE-CONTACT TRAMWAYS AT TORQUAY

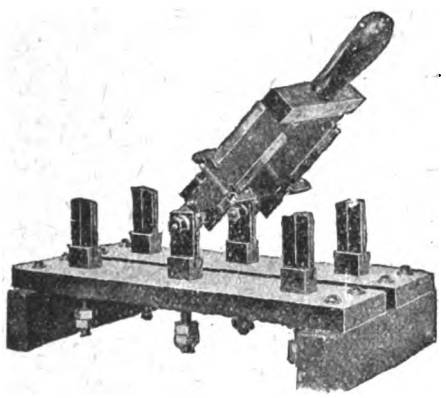
THE Torquay Corporation have consulted Messrs. Mordey & Dawbarn with regard to the contention of the National Electric Construction Co. that the technical difficulties in connection with the working of the Dolter surface-contact system in Torquay are such that the system should be abandoned, and the overhead trolley system substituted. The company also complain that the working expenses of the Dolter system are too high to enable them to make the undertaking commercially successful. The main difficulty has been trouble with the studs, and it is on account of the number of defective studs on the system that the Board of Trade have refused to grant a further licence for the continuation of its working. The Corporation are strongly averse to the overhead system, and unless some agreement is arrived at between the Corporation and the company, it would therefore seem probable that the tramways will cease operation in October.

Messrs. Mordey & Dawbarn were asked to state (*a*) whether the present Dolter system could be made and perfected so as to render it satisfactory, and (*b*) whether any other surface-contact system could be substituted which would be satisfactory. The reply to both of these questions is in the affirmative. Mr. Mordey has carried out an investigation of the system, and has also visited Hastings and interviewed Mr. H. Holliday, the Manager of the Hastings Tramways Co. He is of opinion that the number of faulty studs, which he admits is large on the Torquay tramways, has been largely increased by the fact that so many have been allowed to remain in a known defective condition. Three men are employed on the road by the company on the up-keeping of studs. With regard to the company's claim to abandon the surface-contact system, on the ground of high working cost, an examination of the company's own accounts and a comparison with other hilly towns where the trolley system is in use, shows, says Mr. Mordey, that the company is under a misapprehension in this matter. Figures are given showing that at Bradford, Halifax, and Huddersfield, all working on the trolley system, the units per car mile are 1·88, 1·97, and 2·25 respectively; the revenue per car mile is 10·33d., 11·08d., and 9·73d. respectively; and the costs per car mile are 7·22d., 10·5d., and 9d. These figures are then compared with Wolverhampton, Lincoln, and Torquay, all surface-contact systems, and, of course, running a less number of car miles per annum. In these cases the units per car mile are 1·56, 1·11, and 2·24 respectively, whilst the revenue per car mile is 10·47d., 9·20d., and 10·05d. The cost per car mile in the case of Wolverhampton is 6·6d., and in the case of Torquay 10d., whilst the figure for Lincoln is not given.

The report then deals with the expenditure at Torquay. It points out that the management and general expenses are high, probably due to the smallness of the company. The cost of repairs and maintenance, namely, £2,350 in 1909, is not regarded as excessive, but the cost of power at Torquay is high. The high consumption, says the report, is chiefly due to the hilly nature of the town, and would not be materially reduced by merely substituting the trolley system. The price charged to the company by the Corporation for energy is 1·57d. per unit, but this is not considered unreasonable, in view of the remoteness of Torquay from cheap coal supply and the comparatively small scale of the undertaking. The opinion is expressed that by greater care and attention the present studs could, without prohibitive cost, be made to work satisfactorily. An improved stud designed by Mr. E. A. Mitchell, who was engineer to the company when the line was put down, is regarded with favour, and if this were installed throughout the system, the total cost would be £6,500. In view of the fact that the company had expressed a willingness to spend £10,000 in order to put up the overhead system, Messrs. Mordey & Dawbarn think that they should be strongly urged to adopt Mr. Mitchell's proposal to instal the studs on a mile of track free of cost, on condition that if satisfactory they should be applied to the whole line.

With regard to the second question, whether any surface-contact system could be substituted which would give satisfactory results, Wolverhampton and Lincoln are pointed to as possessing systems which have given satisfaction to the councils in question, and also to the Board of Trade. If it were necessary to change the system in Torquay, which Messrs. Mordey & Dawbarn do not think is the case, there was no reason to doubt that either the G.B. system or the Lorain system would be satisfactory.

At the last meeting of the Council the report was discussed at some length, and a resolution passed authorising the Tramways Committee to take such further action or proceedings as may be necessary or expedient to maintain a surface-contact system of tramways in Torquay.



Crystal Palace School of Engineering.—Mr. J. C. Inglis, President of the Institution of Civil Engineers, will take the chair at 12 noon to-day (Thursday), on the occasion of announcing the list of certificates awarded by the examiners. An inspection of the several departments of the school will subsequently be made.

Electric Lighting Provisional Orders.—The Board of Trade have issued a special report in connection with an application for an electric lighting Provisional Order by Mr. George Balfour for the Boroughs of Ardrossan, Saltcoats, and the portion of the parish of Stevenston in the County of Ayr. The Corporation of Ardrossan refused their consent, and opposed the order on the ground that electric supply in their district would compete with the municipal gas undertaking. A local inquiry was held, and evidence produced, showing that there was a demand for electricity in Ardrossan, and in the circumstances the Board of Trade have decided to dispense with the consent of the Ardrossan Corporation, and have granted the order.

NEW SWITCHES

A NEW line of knife switches has recently been introduced by the General Electric Co. (67 Queen Victoria Street, London). These switches are manufactured at the Witton Works of the company, and are to be known as the "Witton" type. A large number of different sizes, with carrying capacities of from 30 to 1,000 amperes, are kept in stock, and heavier switches up to 10,000 amperes capacity can be made up at short notice. The general design is illustrated in the accompanying figure, and is the same throughout the whole range, which enhances the appearance of a switchboard where several switches of different capacities are assembled together. Care has been taken that the current density nowhere exceeds 1,000 amperes per sq. in. sectional area, and 60 amperes per sq. in. surface area in the contact clips. The low value of the

DOUBLE-POLE "WITTON" CHANGE-OVER SWITCH.

latter figure is important, as most losses in switches are due to insufficient contact surface, and, moreover, it permits of the switches being run at considerable overloads without dangerous heating. As shown in the illustration, the flipper blades, which give the quick break, are fitted with steel collets where they are hinged to the main blades. The latter have steel bushes for the hinge pin, which is also of steel; the wearing parts are therefore very strong. Up to and including the 200-ampere size, the main blades are provided at the handle end with pressed steel clips for attaching the handle, or in multiple switches, the bridge. For sizes above 200 amperes solid steel ends are used. To hold the blade in the "off" position in change-over switches, or where there is no room to swing the switch right over, special shaped steel springs are provided. These are fixed to the side of the hinge contact, and act on the rounded end of the flipper blade pivot pin. Single, double, and triple pole switches for front or back connections can be obtained in this design. The switches are jig made, and all the parts are interchangeable.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

WIRING ACCESSORIES.—We have received from the Sun Electrical Co., Ltd. (118 Charing Cross Road, London), a copy of the section of their illustrated catalogue devoted to wiring accessories. This includes all the materials and small fittings for lighting installations. Wiring conduit, distribution boards, and cable are to be dealt with in a separate section. Several novelties in small switches, plugs, &c., are included.

INSTRUMENTS.—An illustrated pamphlet from the Allgemeine Elektricitäts Gesellschaft of Berlin describes a line of small portable instruments. These are for both A.C. and D.C. circuits, and have a movement consisting of two cylindrical segments of iron, one fixed and one moving, with an outer fixed coil.

LOW-VOLTAGE LIGHTING.—An illustrated leaflet, calling attention to the advantages of low-voltage metal filament lamps used in conjunction with small transformers, has been issued by the Allgemeine Elektricitäts Gesellschaft of Berlin. A description of a miniature lamp-holder transformer for single lamps is included.

ELECTRIC LIFTS.—The same company has issued a leaflet describing electromagnetic safety devices for use with electric lifts. One device prevents the motor circuit being closed unless all the gates are closed; another puts on the brake automatically on the motor supply being cut off; and another arrangement prevents the gates being opened unless the motor circuit is broken.

ELECTRIC LOCOMOTIVES.—A further leaflet from the A.E.G. gives illustrations of several small electric locomotives employed on narrow-gauge railways in connection with quarries, brickyards, large farms, &c. These are on the D.C. system with bow collectors.

DUDDELL OSCILLOGRAPHS.—A very complete list, dealing with the various patterns of the Duddell oscillograph and its accessories has been issued by the Cambridge Scientific Instrument Co., Ltd. (Chesterton Road, Cambridge). The principle of the instrument is clearly explained in the introductory pages of the pamphlet, and descriptions of the different types illustrated with photographs and drawings are given. Explanations of the methods of observing and recording the oscillograms are followed by complete instructions for connecting up and adjusting the instrument. For working with very high pressures, special asbestos woven wire resistances are employed. These are oil-immersed, and are supported on insulating stands suitable for working up to 50,000 volts. Full particulars of the constants of the instruments are given, and a complete price list is included. Some examples of oscillograms taken on various electrical circuits, including oscillatory disturbances, telephone currents, &c., are appended. We are informed that the firm has recently received two orders for Duddell oscillographs for use direct on 50,000-volt circuits; one order is from Japan and the other from Austria.

CHAIN DRIVE.—Messrs. Hans Renold, Ltd. (Progress Works, Brook Street, Manchester), have sent us a copy of a new catalogue which they have just issued. This gives a complete illustrated description of the Renold patent silent chains and sprockets for high-speed driving, with dimensions and prices of standard sizes. New features are a section dealing with the development of the Renold chain, and additions to the practical instructions for laying out and using the gear.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

LAMP-BULB LACQUERS.—A leaflet from T. Francis & Sons (Hampden Street, Bolton), calls attention to the firm's "Permanent" lacquers, especially prepared for colouring the bulbs of incandescent lamps, used for stage effects and advertising signs. These lacquers are also suitable for the glasses of arc projectors.

ACCESSORIES.—A very complete illustrated catalogue, prepared for the wholesale trade only, is to hand from the Victoria Electrical Works (7 Broken Wharf, Upper Thames Street, London, E.C.). This covers all the products of this firm, including switchboards and various classes of switches, wiring accessories, electric bells, indicators, and fire alarms, &c. In the switch section a new automatic transformer switch, constructed under Addison's patent, is listed.

MUNICIPAL PUBLICATIONS.—We have received from the Electric Supply Department of the Borough of St. Marylebone a revised edition of the booklet on "Systems of Charging," explaining the "maximum demand" and "telephone" systems of charging in a manner suitable for the non-technical reader. A new pamphlet, entitled "Other Uses," is an illustrated list of various electrical domestic devices, including ozone apparatus, vacuum cleaners, cooking apparatus, electric irons, fans, and water-heaters.

CRANE MOTORS.—The Phœnix Dynamo Manufacturing Co., Ltd. (Thornbury Works, Bradford), have sent us a new leaflet calling attention to a new series of motors for cranes and other intermittent work. These can be obtained in both the totally enclosed and protected patterns, and are fitted with interpoles. They are standardised for different load factors, the importance of which in rating a motor is explained in the leaflet.

GALVANISING.—A circular is to hand from the Cowper-Coles Galvanising Syndicate, Ltd. (82 Victoria Street, London, S.W.), calling attention to the advantages of the Cowper-Coles cold regenerative galvanising process over the non-electrical hot process. In the latter process, owing to the high temperature of the molten zinc necessary to ensure a uniform coating, the tensile strength of the articles galvanised is reduced, and the threads of bolts, nuts, &c., are also liable to be filled up. In the Cowper-Coles process, a uniform coating of zinc is deposited on the iron electrically in a cold bath, and by a special treatment the iron and zinc are caused to alloy at the surface, thus forming a more permanent protection against rust. The process is called regenerative, as the electrolyte is continuously regenerated and no zinc is wasted. The cost is claimed to be less than that of hot galvanising.

BATTERIES.—A reprint of an article entitled "Galvanic Batteries, and their Manufacture at the Woolwich Works of Siemens Brothers and Co., Ltd.," is being issued by the firm as a pamphlet.

MOTOR-GENERATORS AND CONVERTERS.—A new list from Messrs. Wright & Wood, Ltd. (Century Works, Halifax), gives standard sizes and prices of their motor-generators for technical schools, X-ray work, boosting, biographs, and battery charging. Four types of machines are included: D.C. motor-generators proper, with voltage regulation on the generator side; double-commutator single field D.C. machines without voltage regulation; rotary converters, and induction motor-generators.

Obituary.—The death is announced of Mr. T. Hurley, of Messrs. Gent & Hurley, electric wiring contractors, of Leicester.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 21st, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

7,121/09. **Automatic Transformer Switch.** A. F. BERRY. This is a modification of the Berry series transformer gear to render it suitable for small installations and house-lighting circuits. The primary of the transformer is permanently connected to the mains, but a reactance is inserted which practically prevents any current flowing. Directly any current flows in the secondary, however, the reactance is automatically short-circuited, and the transformer is put into action. This is effected by an electromagnetic device consisting of the reactance and an automatic switch combined. Arrangements with auxiliary transformers and connections for auto-transformers are also described. Six claims, eight figures.

12,685/09. **Protective Devices.** M. B. FIELD and FERRANTI, LTD. This patent covers the balanced system of protection for three-phase distribution networks, feeders, &c., described in ELECTRICAL ENGINEERING, Vol. V., page 599. The neutral point of the system is earthed through a comparatively high resistance, which limits the current to earth in the event of a fault. The faulty section is cut out by means of a relay operated by a current transformer. The latter delivers a current only when the balance between the phases is destroyed, and consists of a wound iron ring round the three-core cable. Eleven claims, eight figures.

15,319/09. **Compensation and Commutation.** R. POHL and THE PHŒNIX DYNAMO MANUFACTURING CO., LTD. In D.C. turbo-generators and A.C. commutator machines, where the commutation conditions are difficult, the usual compensating winding is placed in the face of the main poles, but this is designed to compensate the armature reaction under the poles only. A further compensating winding is provided in the spaces between the poles, and this is designed to produce the flux for commutation also. The compensating winding is arranged close to the armature, and an unwound commutating pole is fixed outside of the winding, or the winding may be in the face of the commutating pole. In order to vary the commutating field without altering the degree of compensation, reluctance is introduced into the magnetic circuit of the commutating poles in the form of a variable air-gap, or the poles themselves are moved transversely across the armature. Seven claims, six figures.

15,494/09. **Motor Control System.** CROMPTON & CO., LTD. J. C. MACFARLANE and H. BURGE. This patent covers the application of the D.C. rotary transformer (described in ELECTRICAL ENGINEERING, Vol. V., p. 629) to the control of motors on the Ward-Leonard system. The driven motor is connected in series with the generator half of the rotary transformer, and speed regulation and regenerative braking are obtained by adding to, or subtracting from, the line volts, the variable pressure of the rotary transformer. Both motor and generator halves of the rotary transformer are separately excited. One claim, one figure.

22,087/09. **Railless Traction System.** E. M. MUNRO and THE RAILLESS ELECTRIC TRACTION CO., LTD. In order to enable the driver of a trolley-bus to ascertain how far away the vehicle is from the trolley wire, the trolley arm is mechanically connected to a small indicator showing the angle between the wire and the arm. Contacts are provided in connection with a bell, so that an audible warning may be given to the driver when the arm is nearly at right-angles. Four claims, two figures.

24,770/09. **Wiring Fittings.** L. M. WATERHOUSE. This patent covers ceiling roses, fuse boxes, and other fittings for use in the flexible system of wiring in which connection from fitting to fitting is made by means of flexible insulated conductors supported at intervals from the ceiling or wall. Each fitting consists of an upper and a lower portion, and the cables are gripped between them when they are screwed together. If the fitting is not of an insulating material, insulating washers are interposed between the portions. Three claims, five figures.

Opposition to Grant of Patents

2,215/09. **Steam Turbines.** G. BELLUZZO. Opposition has been entered to the grant of this patent. It covers the balancing of the axial thrust by the admission of steam at an intermediate pressure to special chambers situated at the high-pressure and exhaust ends of the turbine.

7,809/09. **Condenser.** WILLANS & ROBINSON, LTD., and E. G. IZOD. The opposition to this patent has been withdrawn. It covers an enlarged receiving chamber into which are delivered the air and vapour drawn off from the main condenser by the action of a steam jet, and in which a moderate vacuum is maintained by a water-jet ejector.

Amendment of Specification

12,155/07. **Magneto-Generator.** W. ROOS. Leave has been granted for the amendment of this specification covering a method of oscillating the armature of a magneto-generator.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Names in italics indicate communicators of inventions from abroad.

Arc Lamps: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Electrodes] 18,965/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: KUTTNER [Insulation of aluminium coils] 15,896/09.

Dynamos, Motors, and Transformers: GREENWOOD and CHAPMAN [Armature windings] 17,254/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Propulsion of ships] 19,871/09; BARBOUR [Flexible brushes or collectors] 21,180/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Motor control] 28,941/09; ALLGEMEINE ELEKTRICITÄTS GES. [Motor control] 10,607/10.

Electrometallurgy and Electrochemistry: HARRIS [Electro-deposition] 24,735/09; SCHULTE [Electrolytic removal of grease] 30,463/09; SCHOTT and GEN [Annular liquid anodes] 6,596/10; BLOXAM (*E. Hoorickx & A. Hindel*) [Manufacture of mirrors by electro-deposition] 7,641/10.

Heating and Cooking: PARKINSON [Ovens, hot-plates, &c.] 6,777/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*), 7,860/10.

Incandescent Lamps: PÖPE'S ELECTRIC LAMP CO. (*Trenzen*) [Connections with leading-in wires] 16,076/09; KRAUS [Miners' hand lamp] 18,864/09.

Instruments and Meters: GRAY [Facilitating reading of instruments and meters] 12,379/09; BRITISH THOMSON-HOUSTON CO., GRAY, ROGERS, and HOLDEN [Meters] 30,142/09.

Switchgear, Fuses, and Fittings: LEITNER [Automatic regulators] 15,889/09; ELECTROMOTOR EQUIPMENT CO., and BARLOW [Lift control mechanism] 16,114/09; FERGUSON [Automatic switches] 16,273/09; WARDALE and STOREY [Prevention of over-winding of electric cranes, lifts, capstant, &c.] 17,516/09; CONNARE [Wall socket] 19,045/09; COLLINS [Switches] 24,373/09; WOODHOUSE [Wiring conduit] 25,577/09; THOMSON [Switch] 4,318/10; ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Motor-starters] 5,261/10; SCHULTZ [Switches] 12,522/10.

Telephony and Telegraphy: BAKER and PICTORIAL NEWSPAPER CO. [Photo-telegraphy] 15,918/09.

Traction: DMITRIEW [Electromagnetic clutch for elastic drive] 20,286/09.

Miscellaneous: EVERSHED & VIGNOLES, LTD., and KILROY [Automatically indicating positions of guns] 15,487/09; PARSONS and BALL [Electric clockwork mechanism] 16,117/09; WARDZINSKI [Smoke prevention] 20,352/09; GIBB and MAVOR [Mining elevators and conveyors] 24,868/09; MOY and BASTIE [Scene-raising gear] 5,642/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: KLOSTERMANN, 15,143/10.

Dynamos, &c.: ALLGEMEINE ELEKTRICITÄTS GES. [Frame construction] 15,293/10, and [Control of electrical machines] 15,426/10, and [Machines] 15,753/10.

Incandescent Lamps: WOLFRAM LAMPEN A.-G. [Decarbonising metal filaments] 14,116/10;, ALLGEMEINE ELEKTRICITÄTS-GES. [Vacuum apparatus] 15,754/10.

Telegraphy, &c.: EGNÉR and HOLMSTRÖM [Cooling of heavy current telephone transmitters] 8,019/10; TSCHÖRNER [Photo-telegraphy] 13,104/10; GALLETTI [Production of continuous wave trains for wireless telegraphy] 15,497/10.

Miscellaneous: MASCHINENFABRIK OERLIKON [Governing of variable speed electrically-driven machinery] 4,950/10.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: J. M. WELLINGTON and W. F. DANIEL [Vertical carbon lamp] 7,095/05.

Electric Ignition: E. EISEMAN [Magneto system] 7,504/05.

Instruments, &c.: EVERSHED & VIGNOLES and S. EVERSHED [Motor meters] 9,127/97.

Switchgear, &c.: A. ROMAIN and J. D'AYGUESVIVES [Lamp adapters with fuses] 7,834/02.

Telephony, &c.: H. MANDERS and A. W. SHARMAN [Oscillation generator] 8,172/02; HENLEY'S TELEGRAPH WORKS CO. and H. SAVAGE [Telephone and telegraph cables] 7,105/05.

Traction: R. C. SAYER [Electric mono-rail system] 7,829/05.

Miscellaneous: R. A. SLOAN (*T. Cahill, New York*) [Electrical generation and transmission of music] 8,725/97, R. T. BROTHAM [Electric control of ship's steering gear] 8,112/02; W. G. LEATHER [Advertising signs] 7,173/05.

Digitized by Google

LOCAL NOTES

BARNSTAPLE: *Electric Wiring Powers.*—The Electricity Committee report that further expenditure upon electrical exhibitions is undesirable until the Council have powers to wire premises and sell fittings.

BEXLEY: *Tramway Through Running.*—An agreement has been arrived at between the Council and the Erith Council for the through running of their respective tramcars.

BRISTOL: *Electricity Accounts.*—The total receipts for the year ended March 25th amounted to £79,572, and the working expenses were £36,751. After meeting capital charges there was a deficiency of £2,029, which, however, is covered by the balance brought forward from the preceding year, which amounted to £6,230. There was a net increase of 170 consumers during the year, and the total number of units sold was 8,142,376.

CARDIFF: *Meters on Tramcars.*—The Tramways Committee have decided to purchase 130 meters at £3 5s. each, with which the tramcars will be equipped, in order to check the current consumed on each. The firm who supplied the meters have undertaken to take them back free of cost if at least 6 per cent. of the energy is not saved in the first six months.

EDINBURGH: *Electricity Accounts.*—The annual report states that the number of units sold during the year ended May 15th amounted to 9,833,301 for lighting, and 3,589,527 for power, being an increase of 2 per cent. Over 1,000,000 units were also used for public street lighting. The total revenue was £127,853, and the total expenditure was £125,781, including £58,330 for capital charges.

ERITH: *Electricity and Tramway Accounts.*—The net profit on the electric lighting undertaking is £2,157, after meeting capital charges. The tramway accounts, however, show a loss of £3,436 on the year's working.

FALMOUTH: *Purchase of Electricity Works.*—The Lighting Committee have reported in favour of purchasing the electricity works of the Electric Supply Corporation.

HESTON AND ISLEWORTH: *Canvassers.*—The Electricity Committee have been authorised to make arrangements with any electrical contractors approved by them, for the engagement of canvassers on the following terms:—(1) The contractor to engage and pay a canvasser to devote his whole time to the work, the Council to be in no way responsible for the acts or defaults of such canvasser. (2) The canvasser to take instructions from the Electrical Engineer, and to submit to him a daily report of his work. (3) The contractor to be paid a commission in respect of each installation obtained and connected to the Council's mains at the rate of 10s. per kilowatt for lighting and 5s. per kilowatt for power. The arrangements to be terminable by the contractor or the Council at one month's notice. The Committee have come to a definite arrangement on this basis with Messrs. D. J. Macdonald & Co. Any other contractor approved by the Committee, and who would enter into a similar arrangement, will be treated in the same way.

HULL: *Telephone Undertaking.*—At a meeting of the Telephones Committee last week a statement was read from Mr. G. J. Bentham, M.P. for Gainsborough, with regard to the taking over of the telephone system of the country by the Post Office next year. Mr. Bentham expresses the opinion that if the people of Hull desire to retain their municipal telephone system, they will be able to do so. If they allow their licence to lapse, the Post Office would immediately take over the system, and the rates will at once go up. The opinion of the Telephone Committee is that Hull will desire to retain the system.

LONDON: *London County Council: Tramways.*—The new tramways in Woolwich, which have been constructed upon the four-wire system, *i.e.*, two trolley wires on each line instead of one, in order to avoid interference with Greenwich Observatory, were inspected by Major Pringle and Mr. A. P. Trotter last week, and have since been put into service.

London County Council: Tramways.—The Highways Committee report with regard to constructing certain tramways included in the Bill now before Parliament, and recommend sanction for expenditure in connection therewith. The estimated cost of construction and equipment on the overhead trolley system from Putney Bridge to the High Street, Wandsworth, line is £39,785; the reconstruction of the existing horse tramways from Tooley Street to Deptford, and the construction of authorised trams from High Street, Deptford, to Greenwich, is estimated at £6,470; and the reconstruction of tramways in Highgate Road at £38,730.

London County Council: Tramway Renewal and Reserve Funds.—Further sums belonging to the Tramways Renewals and General Reserve Funds, amounting already to £102,000, have been invested in Canadian 3½ per cent. stock and New Zealand Government 3 per cent. inscribed stock. The former was purchased at £99 per £100 of stock, and the latter at £87⅝.

Fulham: Assessment of Generating Station.—The electric lighting station and appurtenances which, according to the Valuation List in force, is now assessed at £2,850 gross, and £1,900 rateable value, has been inserted in the new Valuation List at £10,500 gross, and £4,500 rateable value. The matter has been referred to a sub-committee for consideration, and in the meantime the Town Clerk has been instructed to give notice of objection to the Valuation List. Notice of objection to the Valuation List has also been lodged by the London County Council in respect of the proposed assessment of the electric lighting station, requiring that the values should be increased to £14,000 gross and £5,600 rateable.

Wiring.—The Electricity Committee report that with a view to giving effect to the proposals for the wiring and fitting of consumers' premises, they have considered and accepted estimates from local contractors for the wiring works, to be carried out in accordance with the specification prepared by the Borough Electrical Engineer. The Committeee have also examined samples, and considered prices of requisite fittings, and approved those selected by the sub-committee.

Lighting of Small Houses.—The Committee further reported having had under consideration the terms upon which supplies of current might be afforded for the one or two lights required in the halls and staircases of maisonettes, on the basis of a fixed rate of charge. In such cases "hour" meters are to be provided instead of the usual recording meter, and, estimating that 1,640 hours per annum will cover the use of one lamp, the charge of 3½d. per unit, using an 8-c.p. carbon lamp, works out at 16s. 9d. per lamp per annum. Provision is to be made, however, that for all current consumed in excess of 1,640 hours, a further charge of 3½d. for every 30 hours, or portion of 30 hours, will be made.

Poplar: Electricity Accounts.—Mr. J. Horace Bowden points out that the average charge of 1·287d. per unit obtained at Poplar is the lowest price obtained in London during the past year. This is due partly to the supply in bulk of 1,027,429 units to Stepney. The net profit for the year was 31 per cent. greater than for the previous year.

Stepney: Rental of Time Switches.—As the cost of maintenance of time switches is considerably lessened in consequence of the improved type of instrument used, the present rental of two shillings per month is to be lowered to one shilling in the case of those consumers who are supplied with current up to 25 amperes.

MACCLESFIELD: *The Trackless Trolley System.*—The Railless Electric Traction Co., Ltd., have given notice of their intention to apply for a Tramway Provisional Order authorising the use of the trolley omnibus, and also an Electric Lighting Provisional Order for the district. The New Electricity Co. of Macclesfield, Ltd., have also given notice of a similar intention.

NELSON: *Supply in Bulk.*—At Brierfield District Council meeting on July 21st, it was agreed to enter into an agreement with Nelson Corporation for the supply of electricity at the following terms: 2½d. per unit for lighting purposes, and 1½d. per unit for motive power, to extend over three years. These terms are a reduction from 3d. to 2½d. for lighting, and from 2d. to 1½d. for motive power.

NORWICH: *Electricity Undertaking.*—The report of the Electricity Committee for last year states that while the output has remained practically stationary, there has been such a marked reduction in the working expenses that the net balance, after meeting capital charges, namely, £5,962 12s., is a record for the undertaking. This sum is £2,280 12s. in excess of that for the previous year. The sum of £2,000 has been added to depreciation.

OLDHAM: *Wiring Powers.*—A communication has been received from the Incorporated Municipal Electrical Association with regard to obtaining wiring powers for all municipalities. The Chairman of the Electricity Committee, to whom the communication was sent, said that this only opened up the whole question of municipal trading again, and the Council was strongly opposed to it. The communication was, therefore, allowed to lie on the table.

SOUTHPORT: *Electricity Accounts.*—The result of the past year's working of the electrical undertaking shows a net profit of £1,475.

STROOD: *Electric Lighting Order Revoked.*—The Board of Trade revoked the Strood and Dartford (Rural Districts) Electric Lighting Order, 1903.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ASTON.—An inquiry was held last week concerning a loan of £23,500 for electrical extensions. Of this amount, £12,515 are for plant and machinery, and £10,590 for mains and services. During the course of the inquiry Mr. H. R. Hooper, the Local Government Board Inspector, questioned the wisdom of transferring £1,500 from the previous year's profits to relief of rates, and then borrowing £1,500 for services. To borrow money with one hand at 3¼ per cent., and to pay it out as a

Digitized by Google

bonus with the other, meant that the ratepayers had to pay the 3¾ per cent. Eventually the Town Clerk agreed to withdraw the latter sum from the loan asked for.

BLACKPOOL.—The provisional consent of the Local Government Board is to be sought to proceed with the extensions at the electricity works at once, and the machinery must be completed in time for the coming winter load, which would be impossible if the usual formalities of applying to the Local Government Board were observed.

BRIGHOUSE.—A Local Government Board inquiry into a loan of £423 for the electricity undertaking has been held.

LEICESTER.—A Local Government Board enquiry will be held to-morrow concerning a loan of £19,190 for electrical extensions.

MANCHESTER.—Tenders are invited by August 2nd, for an induced-draught plant at Bloom Street generating station. Particulars from the Chief Electrical Engineer.

ROCHDALE.—The Town Council have decided to apply for a loan of £35,933 for tramway extensions along the Whitewell Valley, and for £5,000 for extending the car depôt and offices.

SOUTH AFRICA: *The South African Mining Journal* states that Mr. Howard Pim has obtained, on behalf of the Transvaal Hydraulic Power Syndicate, the concession for the erection of a generating station at Tweefontein. It is proposed to form a company with a capital of £926,000. The same journal states that it is proposed to establish an electro-chemical works in connection with this power station.

TORQUAY.—A Local Government Board inquiry was held last week into an application for a loan of £3,500 for the Electric Light Department.

WALTHAMSTOW.—Application is to be made for sanction to borrow £1,838, the estimated expenditure for three years on main extensions, house services, &c.

YARMOUTH.—A cooling tower is to be installed at the power station at an estimated cost of £750.

Miscellaneous

BURNLEY.—The Burnley Technical Institute is to be fitted up with a complete set of apparatus, at an estimated cost of nearly £300, for the practical teaching of electrical engineering.

DENMARK.—Tenders are invited by August 2nd for the supply of electricity meters to the Copenhagen Lighting Department. Copies of the specification may be seen at the Board of Trade, 73 Basinghall Street, London, E.C.

FRODINGHAM.—The Council have decided to use electricity for street lighting.

LONDON: *London County Council.*—Tenders are to be invited for the erection of the second section of the Bow car shed.

NEWPORT.—Tenders are invited for a supply of carbon filament lamps, radiator lamps, flame arc lamps, and meters for the next twelve months. Particulars from the Borough Electrical Engineer. Deposit 10s., and tenders by August 15th.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

W.C.—Theatre, Shaftesbury Avenue and Broad Street, Holborn, W.C. (2,450 pl.). Architect, B. Crewe, 75 Shaftesbury Avenue.

S.W.—Building, Pulford Terrace, Pimlico, S.W. (52,200 sq. ft.), for the Gamage-Bell Motor Cab Co., Ltd., 78 Holborn, W.C.

The Education Committee of the London County Council propose to invite tenders for the electric lighting of the schools now being erected on the Hoxton House site.

N.—Technical institute, Ponder's End (£6,724). Builders, H. Knight & Son, Tottenham.

Sorting office, Manor Road, Stoke Newington. H.M.O.W., Storeys Gate, S.W.

E.—Alterations Education Offices, West Ham (£5,350). Architect, Education Committee, West Ham T.C.

N.E.—Extension car shed, Walthamstow. Engineer, Walthamstow U.D.C.

S.E.—Additions Eltham Cottage Hospital, S.E. Whistler & Worge, builders, 80 High Street, Eltham.

PROVINCES.

BASFORD AND SNEINTON DALE.—Schools (£31,800). W. J. Abel, secretary, Education Committee, Nottingham T.C.

BRIGHTON.—Additions, &c., municipal school of art (£721). T. Simpson & Son, surveyors, 16 Ship Street, Brighton. W. A. Field & Cox, builders, Brighton.

CANTON (Cardiff).—School, Kitchener Road (£12,261). F. Bond, builder, Beda Road, Canton.

CHICHESTER.—Reconstruction of infirmary (£20,000). The Governors.

CROWBOROUGH.—Drill hall. Secretary, Sussex Territorial Association.

CROYDON.—Enlargement of central polytechnic. J. Smyth, secretary, Education Committee, Croydon T.C.

DONCASTER.—Theatre, Hallgate and Silver Streets. Major J. H. Crosby, director, Palace Theatre (Doncaster), Ltd.

DUBLIN.—The Governors of the Royal Hospital for Incurables, Donnybrook, invite tenders for the electric lighting of the institution. The Consulting Engineer is Mr. T. Tomlinson, 16 Beresford Place, Dublin.

FLEETWOOD.—A Local Government Board inquiry is to be held into a loan of £4,100.

HANWELL.—School (£7,932). H. Knight & Son, builders, Tottenham, N.

HOUNSLOW.—A Local Government Board inquiry has been held regarding a loan of £3,600.

NORTHALLERTON.—Enlargement of grammar school (£3,200). J. C. Wrigley, secretary, Education Committee, North Riding of Yorks C.C., Northallerton.

PAISLEY.—School for defective children Renfrew Road (£9,500). Craig-Barr & Cock, architects, Paisley.

PETERBOROUGH.—Theatre, Broadway, for Mr. Fitzwilliam, architect, Peterborough.

SALTBURN.—School (£6,090). Harold Arnold & Son, builders, Doncaster.

SHORLSTON.—School (£7,800). W. V. Dixon, secretary, Education Committee, West Riding of Yorks. C.C., Wakefield.

SHREWSBURY.—Slaughterhouse (£5,275). G. H. Bickerton, builders, Shrewsbury.

STIRCHLEY.—Swimming baths (£10,000). J. P. Osborne, architect, Birmingham. E. Crowder, builder, Farm Street, Birmingham.

TOXTETH.—Alterations at workhouse (£4,500). R. A. James, clerk, Board of Guardians, Toxteth.

TENDERS RECEIVED AND ACCEPTED

LONDON: *London County Council.*—The following tenders have been received for road-work and plate-laying, exclusive of the supply of rails and special track-work for the construction, on the underground conduit system, of tramways from Battersea Park Road to King's Road, Chelsea:—Dick, Kerr & Co., Ltd., £28,210 19s.; W. Manders, £29,147 3s.; Kirk & Randall, £30,236; A. N. Coles, £30,435 2s.; and John Mowlem & Co., Ltd., £30,687 11s. The tender of the Standard Engineering Co., Ltd., at £3,610 15s., has been accepted for the heating and ventilation of the second section of the Central Car Repair Depot. The following tenders were received for the supply of an electric winch:—Ernest Scott & Mountain, Ltd., £135 1s. 6d.; Clarke, Chapman & Co., Ltd., £166, less 2½ per cent. discount; Royce, Ltd., £165 10s.; General Electric Co., Ltd., £157 15s.; and Electric Construction Co., Ltd., £202. The tender of Messrs. Ernest Scott & Mountain, Ltd., has been accepted.

Fulham.—The Borough Council has accepted the tender of the Electrical Co., Ltd., for the supply of 150 electricity meters in various sizes, at the following rates:—3-amp., £1; 5-amp., £1; 10-amp., £1; 25-amp., £1 3s.; 50-amp., £1 4s.; 75-amp., £1 9s.; 100-amp., £1 11s. 6d. The total amount of the contract is £153 10s.

Hammersmith.—The Borough Council has accepted the tender of the Standard Cable Co., at £181, for 2,500 yards of 0·025 sq. in. low-tension service cable.

Hampstead.—The tender of the British Westinghouse Co. for a 1,000-kw. single-phase exhaust steam turbo-alternator has been accepted. A 250-kw. mixed pressure turbo-alternator has also been ordered from Messrs. Willans & Robinson, with condensing plant from the Klein Engineering Co. The switchgear will be obtained from Messrs. Ferranti, Ltd., and Messrs. Siemens Bros. Dynamo Works, Ltd.

Hornsey.—The Education Committee has accepted the tender of F. Bevan & Co. (Dartford), at £284 17s. 2d., for installing electric light in the Stroud Green School. Twenty-four tenders were received.

Stepney.—The Borough Council has received the following tenders for the supply of a power board and a lighting board:—Edison & Swan United Electric Co. (*a*) power board, £123 9s.; (*b*) lighting board, £12; Kelvin & J. White, Ltd. (informal), (*a*) £130 2s., (*b*) £21 8s.; General Electric Co., Ltd. (*a*) £142 (*accepted*), (*b*) £22; Elliott Bros. (*a*) £144 10s., (*b*) £22 5s.; W. White & Co. (*a*) £154, (*b*) £16 (*accepted*); A. W. Penrose & Co., Ltd. (*a*) and (*b*), £164; Crompton & Co., Ltd. (*a*) and (*b*) £192.

Messrs. Merryweather & Sons inform us that they have recently received an order from the Lancashire & Yorkshire Railway for an electrically-driven "Hatfield" treble barrel pump, capable of delivering 600 gallons per minute at 100 lbs. pressure when running at 135 r.p.m., driven by a 60 h.p. motor through chain-gearing, for fire protection purposes at Castleton.

South African Institute of Electrical Engineers.—The *Transactions* of this institution for May, 1910, contain a Paper by Mr. A. G. Heather on "Protective Devices for Electrical Apparatus," in which the author describes the various systems of protecting machines and circuits with special reference to A.C. relays. The report of the discussion includes some remarks by Mr. B. Price, the inventor of the Merz-Price system, who was present at the meeting in Johannesburg. A Paper by Mr. W. C. Brown describing a new type of machine for the magnetic extraction of iron from ore and pulp, and the discussion of a Paper by Mr. A. E. Scott on "Rotary Converters," are also included.

Digitized by Google

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £57 5s. to £57 15s. per ton (last week, £56 5s. to £56 15s.).

ST. HELENS CABLE CO.—On Saturday last, the first annual bowling competition was held on the new green at the works. There were eighty-four entries for prizes of sets of bowls, presented by Mr. T. C. Callender and Mr. James Taylor, directors. The green was constructed by the staff, without expense to the company, early this year, and is situated in a corner of the works yard.

TRADE MARK.—Certificates of Registration under the Trade Marks Act have been granted to Messrs. Hans Renold, Ltd., of Brook Street, Manchester, manufacturers of the "Renold" driving chains, for the name "Renold" and the trade mark illustrated herewith.

PLANT FOR SALE.—The Sanitary Commissioners of Gibraltar have a 25-kw. single-phase Ferranti type alternator for sale, and seven Mordey-Victoria single-phase transformers; also induced draught fan. Some particulars may be obtained from the Crown Agents to the Colonies, Whitehall Gardens, S.W.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—The trustee in the bankruptcy of George Sutcliffe, electrical engineer, 22 Church Street, Abertillery, has been released.

The trustee in the bankruptcy of Ernest Goodman, electrical engineer, 3 Hertford Street, Coventry, has been released.

DISSOLUTION OF PARTNERSHIP.—J. A. Plumb and F. A. Horsfield, electrical engineers, 64 Newman Street, Oxford Street, London, and 62 Argyle Road, Tottenham, have dissolved partnership.

AWARD AT THE JAPAN-BRITISH EXHIBITION.—A supplementary list of Grand Prizes includes the name of the Rees Roturbo Manufacturing Co., Ltd., 20 Bucklersbury, London, E.C., for their exhibits of pumps.

G. HARLAND BOWDEN & CO.—The business carried on by Messrs. G. Harland Bowden, F. C. Anderson, and C. A. Atchley, under the firm name of "G. Harland Bowden & Co.," has been dissolved. Mr. Harland Bowden, having sold his interest in the business conducted from the Manchester and Glasgow offices to his partners, Mr. Anderson and Mr. Atchley, will continue the London and South Wales branch of the late firm at Suffolk House, 5 Laurence Pountney Hill, London, E.C. Mr. Anderson and Mr. Atchley will continue the Manchester and Glasgow branches in partnership at 196 Deansgate, Manchester, and 50 Wellington Street, Glasgow, as heretofore, under the firm name of "The Harland Engineering Co."

The Prevention of Accidents.—The National Association of Manufacturers of America has recently taken up the question of prevention of industrial accidents and industrial indemnity insurance, and has sent a Commission abroad to study the methods and practices in Europe. The Commission comprises Messrs. F. C. Schwedtman, chairman of the Association's committee on industrial insurance, and Mr. J. A. Emery, the legal adviser of the Association. These gentlemen have established headquarters in Berlin and London, and will visit all the more important manufacturing centres in order to inspect the various safety devices in use in factories, workshops, &c., and to obtain information relating to schemes of industrial insurance.

The Poisoning Fatality in Neal Street, Holborn.—At the meeting of the Borough Council yesterday, the Public Health Committee reported that early on the morning of June 10th, the police gave notice to the Borough Surveyor of an escape of "gas" in several of the houses in Neal Street, and that a number of the occupiers had been poisoned and removed to hospital. The Borough Surveyor communicated with the Gas Light & Coke Co., Ltd. No escape of coal gas, however, was found, but on opening up the public way in front of some of the houses the ground was found to be very hot, and the bitumen around the cables of the Charing Cross, West End & City Electricity Supply Company in a molten condition. The Borough Surveyor communicated with that company, who found about 150 ft. of their cables opposite the houses of Nos. 48 to 68 had been fused. The Medical Officer of Health, having made some inquiries, suggested to the Town Clerk the desirability of some inquiry being made into the matter by a Government Department, and the Town Clerk addressed a communication to the Home Office thereon. The letter was forwarded to the Local Government Board, who requested Dr. Bond to make an investigation into the matter. Dr. Mott, of the Charing Cross Hospital, who investigated the cases, expressed the opinion that the symptoms were due to carbon monoxide poisoning. The Medical Officer of Health has informed the Committee that in the houses where the cases occurred the front walls of the basements were defective, and the front areas and stall boards were quite enclosed, so that the "gas" could easily enter the houses. At the other houses there were either open gratings over the front areas or in the stall boards, or the front walls were well concreted, or a combination of these conditions, so that the "gas" could not enter those houses in any quantity. The Medical Officer of Health is now reporting in detail on the matter to the Local Government Board.

APPOINTMENTS AND PERSONAL NOTES

Linesmen for extra high tension work are required by the Yorkshire Electric Power Co. (See an advertisement on another page.)

A senior assistant to take charge of the new electric generating station, a junior assistant, and a second lecture assistant, are required at the Northampton Institute. (See an advertisement on another page.)

The Alloa Town Council have appointed Mr. H. A. Tulloch Borough Electrical Engineer. The Council have acquired the generating station of the British Electric Plant Co., from which hitherto a supply in bulk has been taken.

Mr. G. D. Vickers, who, as announced in our last issue, was appointed Assistant Electrical Engineer to the Watford Council, has declined to take up the position, owing to his firm at Smethwick having granted him an increase of salary. Mr. R. B. H. Cragg, of Bermondsey, has been appointed to the post.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Montreal Light, Heat & Power Co., 1¾ per cent. for the quarter to March 31st.—Kensington & Knightsbridge Electric Light Co., interim dividend on the ordinary shares for the June half-year at the rate of 8 per cent. per annum.—Fife Tramway, Light & Power Co., interim dividend on the preference shares for the June half-year at the rate of 6 per cent. per annum.

Chelsea Electricity Supply Co., interim dividend of 4 per cent. Buenos Aires Tramways Co., 1s. 3d. per share for the three months ended June 30th. St. James & Pall Mall Electric Light Co., interim dividend for the June half-year at the rate of 10 per cent. per annum on the ordinary shares.—Bristol Tramways & Carriage Co., 4 per cent. for the half-year ending June 30th.—Central London Railway Co., 3 per cent. per annum on the ordinary shares, and 4 per cent. on the preferred shares for the June half-year, carrying forward £40,000.

Metropolitan Electric Supply Co., interim dividend at the rate of 4 per cent. for the half-year ended June 30th.

METALITE.—Subscriptions are invited for an issue of 380,000 £1 shares. The Company has been formed for acquiring the business of the Bryant Trading Syndicate, Ltd. The subscription lists close on Friday for town, and on Saturday for country. The prospectus is given in our advertisement pages.

TELEGRAPH CONSTRUCTION & MAINTENANCE CO.—Lord Selborne has accepted the position of Chairman.

Institution of Civil Engineers.—H.M. King George has been graciously pleased to become Patron of the Institution of Civil Engineers, of which Institution he was an Honorary Member for 17 years before his accession to the throne.

The "Mazda" Lamp.—It may be of interest to our readers to know that the word "Mazda," now very prominently before the public as the trade name of a well-known metal filament lamp, is not so new as might be expected. In the writings of Zoroaster, the prophet of the Indo-Eranians, who lived in Persia some 3,500 years ago, the deity is addressed as "Ahura-Mazda," "Ahura" signifying Lord, and "Mazda" All-knowing. The Aryans, who followed the prophet's teaching, were called Mazdayasnians. The religion, a very pure monotheistic one, still lives among the Parsis of Bombay. The all-knowing is a very happy appellation of a lamp which is the result of combined effort of many investigators.

The Carbon Filament Lamp Trust.—According to the *Berliner Börsen-Courier*, there is a possibility of the dissolution of the carbon filament lamp trust formed in the year 1903 under the name of the Verkaufsstelle vereinigter Glühlampenfabriken Ges., Berlin. This combination includes firms in Germany, Austria-Hungary, Sweden, Holland, Italy, and Switzerland, and was intended to continue until the year 1914. Among the 18 members are the Allgemeine Elektricitäts Ges., Siemens & Halske A.-G., and the A.G. Pintsch. No British firms are included, and the French firms which joined have since fallen out. It is stated that the total sales of the combination have remained fairly constant at 30,000,000 lamps per annum, but that the profits during the last five years have diminished by two-thirds. One cause of the reduction in the profits is stated to be the new taxation which, it will be remembered, is based on the watt consumption, and therefore falls especially heavy on carbon filament lamps. On account of the possible reduction in prices and numbers sold owing to the competition of the tungsten and other metal filament lamps, and the large number of firms which are springing up outside the trust, the continuation of the trust seems improbable. As practically all the firms inside the combination are also manufacturing metal filament lamps, however, an attempt may be made to bring the sale of these also under the control of the trust.

Digitized by Google

NEW COMPANIES

NORTH-EAST BRAZIL DEVELOPMENT CO., 1 and 2 Milk Street, London. Capital, £17,500 (7,000 cumulative preference shares). Civil, mechanical, and electrical engineers, railway and tramway constructors, &c.

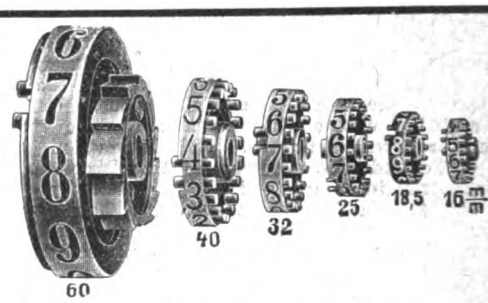
EAST KENT ELECTRIC SUPPLY CO., 36 New Street, Ashford, Kent. Capital, £30,000 in £5 shares (1,500 preference shares). Electrical engineers, contractors, &c. The subscribers include Mr. H. T. Holman, Electrical Engineer, Chantry House, Headcorn.

METALITE.—This company was registered on July 21st, with a capital of £500,000 in £1 shares, to carry on the business of manufacturers of electric lamps, filaments, radiators, stoves, meters, and fittings, and apparatus and appliances of all kinds for use with electricity, and to acquire the businesses of the Bryant Trading Syndicate, Ltd., and International Filaments, Ltd. Minimum cash subscription, 150,000 shares. The number of directors is not to be less than three nor more than nine: the subscribers are to appoint the first. Remuneration, £400 each per annum (chairman, £500), and 5 per cent. of the net profits remaining after 15 per cent. dividend is paid, divided (such additional remuneration not to exceed £5,000 in any one year).

COMPANIES' MEETINGS AND REPORTS

CROMPTON & CO.—As announced in our last issue, there was a debit balance of £23,369 on the past year's working. The report states that, in view of keeping the works employed, a considerable amount of business has been taken at cost. The completion of a large contract in the East has entailed a heavy charge on the year's accounts, whilst litigation in connection with an order for pumping plant has involved the company in special legal expenses. The actual loss for the year, after making the usual provision for depreciation and charging repairs against revenue, was £20,493, compared with a profit of £10,051 for the previous year. After meeting debenture interest and other charges, and deducting the balance brought forward, the total debit is as mentioned above. The Board have decided to write down the company's holding in the Electric Supply Corporation to £4 per share, taking the necessary amount from the reserve fund. During the past year exceptional expenditure has been incurred in connection with an invention which is likely to prove of great value to the company. With the exception of £600, the price of purchasing the patent in this connection, the whole of this expenditure has been charged to revenue. Taking all things into consideration, the directors are of opinion that by the exercise of the most rigid economy a profit can be earned, even on the basis of the present low prices. Since the close of the financial year an improvement is noticeable in the value of orders coming from Colonial and foreign sources.

EAST LONDON RAILWAY.—At the meeting on Tuesday, Lord Claud Hamilton, who presided, spoke in favour of the electrification of the line, and proposed to approach one or two of the large electrical companies with regard to the scheme of electrification on a principle of deferred payments extending over several years.



CITY & SOUTH LONDON RAILWAY CO.—Mr. C. B. Stuart Wortley presided at the annual meeting on Tuesday, when the report and accounts abstracted in our last issue were adopted. He defended the reduction in fares that have been made, and spoke at some length on the proposals with regard to the establishment of a Conciliation Board.

Electric Traction on the Metropolitan Railway.—Before the Railway and Canal Commissioners on Thursday, a dispute was heard between the Metropolitan Railway Co. and the Great Western Railway Co., with reference to the conversion to electric traction of the Hammersmith-City line. The Great Western Co. have running powers over the Metropolitan system from Bishop's Road to the City, for which an annual rental of £15.000 is paid. The Metropolitan Company's Act of 1908, which authorised the conversion to electric traction of that Company's system, provided that any dispute between them and the Great Western Co. on this matter should be referred to arbitration. The two Companies have been unable to agree as to the payment to be made to the Metropolitan Co. in connection with this conversion. Mr. Balfour Browne, K.C., for the Metropolitan Co., claimed the actual cost of the conversion, plus a reasonable profit. Sir Alfred Cripps, K.C., for the Great Western Co., contended that the payment to be made should be based on the actual saving of working expenses to the Great Western Co. The Court held that the arbitration clause of the Act of 1908. referred to above, should be construed in the manner argued by Sir Alfred Cripps. Counsel for both parties are to agree, and submit a decision to the Court.

STERLING TELEPHONES

SUMMARY

Our monthly supplement on Electrical Engineering in Mines is included in this issue. It opens with an article on colliery supply in Northumberland and Durham, outlining the work of the large power companies in that district, and a short account is given of a visit to the electrical installation at a lead mine. Some extracts follow from the reports of H.M. Inspectors of Mines, and an abstract of a paper putting in a plea for the use of earthed concentric cables in collieries is published. Further articles deal with American regulations for electricity in mines, mining cables, and accessories and mining patents published during July.

Mr. George Flett, Managing Director of Messrs. Dick, Kerr & Co., Ltd., was killed in a motor-car accident last week. (Page 504.)

At the half-yearly meeting of the London, Brighton & South Coast Railway Co. yesterday, it was stated that the South London single-phase line continues to give the utmost satisfaction, both commercially and technically. The contract with the London Electric Supply Corporation for the supply of electrical energy has been revised, and this will result in a substantial decrease in the cost of energy. The single-phase system is now being applied to the line from Peckham Rye to the Crystal Palace. (Page 504.)

The summer meeting of the Institution of Mechanical Engineers was held last week in Birmingham and London in conjunction with the American Society of Mechanical Engineers. The Papers discussed in Birmingham related mainly to general railway matters, machine tools, &c., but the Papers read in London were entirely devoted to electric traction. Mr. F. W. Carter dealt with electrification of suburban railways, giving some comparative curves for continuous-current and single-phase motors, and discussed the matter generally. Mr. H. M. Hobart took up a vigorous attitude against single-phase working for suburban lines; similarly Mr. W. B. Potter put in a plea for 1,200 volt continuous-current working even for infrequent service; Mr. L. R. Pomeroy gave some comparisons between steam and electric working for main line service, but showed that there were not the same advantages for electric traction as for suburban service. Mr. G. Westinghouse, on the other hand, was certain that electrification would ultimately extend to main lines, and emphasised the importance of a standard system to facilitate interchange of traffic, recommending single-phase working for the purpose. (Page 505.)

Judgment has been given against the West Ham Corporation in the case brought by the India Rubber, Gutta Percha, and Telegraph Works Co., Ltd., concerning the financial management of the West Ham electricity undertaking. The judgment took the form of a number of declarations, but injunction was not granted. (Page 509.)

Digitized by Google

The Leicester Corporation have decided not to appeal against the recent decision of Mr. Justice Neville, in which he held that the Electric Lighting Acts do not authorise municipalities to wire premises or supply fittings. The Electrical Contractors' Association have suggested to the Sheffield Corporation that they should accept this judgment. (Page 509.)

Among the specifications published by the Patent Office on Thursday last was one by the British Thomson-Houston Co. for a system of electrical marine propulsion, in which the motor is permanently connected with the generator, the reversal being obtained by running a reversing element of the main turbine.—Messrs. J. H. Holmes & Co. and W. A. Clatworthy have applied for leave to amend their patent for the electric driving of printing presses by substituting a new claim for the two first claims which were stated to be invalid by the Appeal Court last January.—A patent by J. Schmidt for a steam turbine rotor disc with radial slots in which to fix the blades, expires on Sunday after its full life of fourteen years. (Page 510.)

According to the annual report on the work of the Public Health Department of the Corporation of London, new flame arc lamps have been substituted for some of the old open-type lamps in use in the City for street lighting, but the total number of arc lamps has not been increased. The number of gas lamps has decreased by ten. Experimental arc lighting is still in progress. (Page 511.)

Two 3,000-kw. Curtis turbines have been started up at the Bradford electricity works.—There was a deficit of £2,029 upon the Bristol electricity undertaking last year.—Cardiff tramway accounts show a net profit of £11,032 for last year, and Derby tramway accounts £3,626.—At St. Pancras, the net profit last year upon the electricity undertaking was £9,506.—An additional steam generating-set is to be installed at Launceston (Tasmania) in preference to a Diesel engine.—West Bromwich Corporation have refused an offer from a power company for a supply of electricity in bulk. (Page 511.)

A new storage battery is to be installed at Accrington; cable is required at Barking; a loan of £52,000 is being applied for by the West Ham Corporation, and extensions are to be carried out at Heston and Isleworth, Hounslow, Leicester, Southampton, Southend, Stoke-on-Trent, and Wrexham.—The Amsterdam municipality propose to erect a power station. (Page 512.)

A dividend of 14 per cent. is recommended by the A.E.G. (Berlin) for 1909.—A contract has been entered into for the extension of the Central London Railway to Liverpool Street.—An interim dividend at the rate of 5 per cent. per annum is recommended by the Rees Roturbo Development Syndicate.—Dividends of 6 per cent. are declared upon both preference and ordinary shares of the Dublin United Tramways Co. (Page 514.)

OBITUARY

George Flett.

Mr. GEORGE FLETT, Managing Director of Messrs. Dick, Kerr & Co., Ltd., had so many personal friends in the electrical industry that the announcement of his death will come as a shock to many of our readers. On Wednesday last week, in Birmingham, he was being driven in a motor car to New Street Station, and was seated next to the driver. A child suddenly ran across the road, and, in swerving to avoid him and simultaneously applying the brakes, the driver tilted the car over. The body of the car fell on Mr. Flett, who was killed.

George Flett was born in January, 1855, in the town of Wick, N.B. He received his early training in Glasgow, and entered into active life in London some 28 years ago, when he became associated with Messrs. Dick, Kerr & Co., Ltd. From his early days in London he had been intimately connected with tramway contracts in this country, and saw the gradual extinction of the horse tramways, the partial adoption of cable traction, and the general use of electric traction. While his early experience was chiefly gained in contracting, he had been for the last 12 or 13 years closely concerned with the manufacturing side of electrical engineering, and in this connection had been associated with some very notable developments. One of the most important schemes in which he was deeply concerned was the electrification of the Liverpool and Southport section of the L. and Y. Railway, while contracts for electric tramways and railways at home and abroad were constantly engaging his attention. Having made during his career prolonged journeys abroad, it was natural that he should have become associated with electrical schemes, and at different periods had succeeded in carrying through important electrical contracts in Japan and the Far East. In addition to being Managing Director of Dick, Kerr & Co., Mr. Flett was a director of the Metropolitan Amalgamated Railway Carriage & Wagon Co., Ltd., the Patent Shaft & Axletree Co., Ltd., the Projectile Co., the British Aluminium Co., Ltd., the Rio de Janeiro Tramway Light & Power Co., the Mexican Light & Power Co., Ltd., the Monterey Railway Light & Power Co., and the British Engineering Co. of Egypt. Although Mr. Flett never contested a Parliamentary election, he was a keen and outspoken advocate of Tariff Reform. Being a broad-minded man, he chafed against the problem having become too much of a party one, viewing the desirability of Tariff Reform from the wide imperialistic point of view, and as a means of strengthening the tie between the Colonies and the Mother Country. He was a member of Mr. Joseph Chamberlain's Tariff Reform Commission.

ELECTRIC TRACTION ON THE BRIGHTON RAILWAY

The continued success of the South London single-phase railway was the chief point of interest at the half-yearly meeting of the London, Brighton & South Coast Railway Co. yesterday, and the work of converting the existing line to the Crystal Palace has actually been commenced. The scheme of extension consists of the railway from Peckham Rye, where a junction is made with the South London Railway, through Tulse Hill to the Crystal Palace, and from Battersea Park, where the South London line is joined again, through Clapham Junction, Balham, and Streatham Hill to West Norwood, where the first-mentioned line is met. These lines form a very important part of the company's suburban system, and serve some of its most populous districts, most of which are intersected by the London County Council tramways. The large increase in the number of passengers carried on the South London Elevated Electric Railway during the first few months of operation has been maintained, whilst the officials have nothing but praise for the system from the mechanical point of view.

Consideration has had to be paid to the cost of electrical energy, which apparently has been felt to be too high a percentage of the total working costs. It is admitted, however, that the introduction of the single-phase system was a big experiment, and without experience either on the part of the railway company or the London Electric Supply Corporation, who supply the energy, it was difficult to arrange very close contracts. Now, however, that it has been decided to extend the system, the company have been able to revise the arrangement with the London Electric Supply Corporation upon a more favourable basis, which will substantially decrease the cost of current. There was an increase during the half-year of £9,092 in locomotive power expenses, which is attributed to the cost of electric energy. The company carried 2,000,000 more passengers during the half-year, and due credit is given to the electric line for this, although the main line traffic has also increased.

Lord Bessborough, who presided at the meeting, expressed the regret of the Board at the death of Major Cardew, who was a director of the company for a short time. The report and accounts were adopted without any discussion beyond an expression of satisfaction on the part of one shareholder that the single-phase system had proved satisfactory in spite of the doubts that were being cast upon it.

Serious Fire at Accrington.—It is rumoured that a serious fire at a large drapery establishment last Saturday at Accrington was electrically caused, although as the building was completely gutted, there is no reliable evidence. It appears that the shop was packed with inflammable material from floor to ceiling, even in contact with flexible wires used for window lighting.

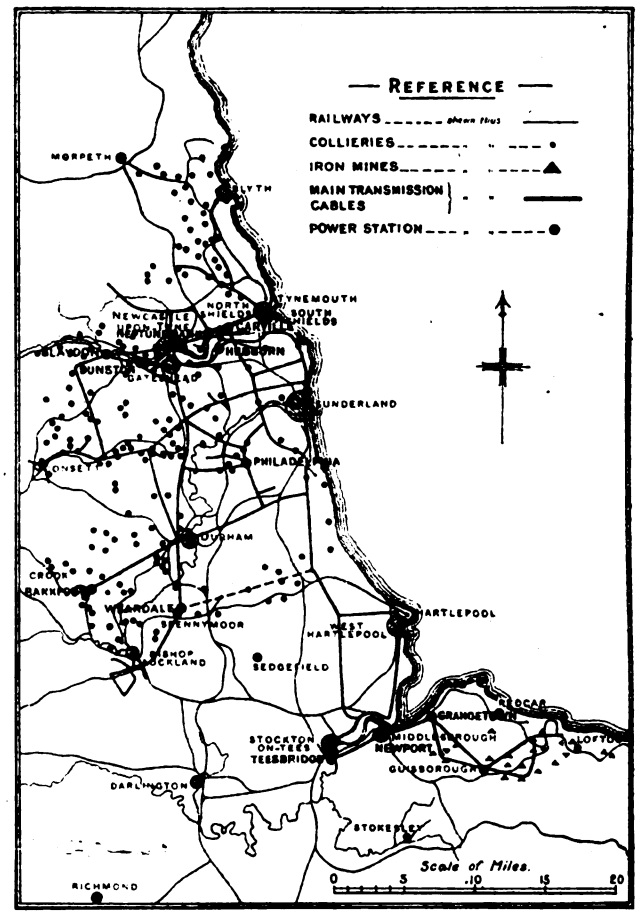
ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.



Letters should be addressed, "The Editor, Electrical Engineering, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

COLLIERY SUPPLY IN NORTHUMBERLAND AND DURHAM

THE system of co-operation in the north-east of England between the supply authorities and consumers, such as iron works and collieries with coke ovens who have large amounts of waste heat to dispose of, has been from time to time referred to in these columns. In particular, reference may be made to the Papers by Mr. C. H. Merz (Electrical Engineering, Vol. IV., p. 505) and by Mr. A. B. Gridley (Electrical Engineering, Vol. V., p. 38). The power companies concerned are the Newcastle-upon-Tyne Electric Supply Co., Ltd.; the County of Durham Electrical Power Distribution Co., Ltd., and the Cleveland & Durham County Electric Power Co. These three companies have their own coal-fired generating stations, but also buy electric power in bulk from a company called the Waste Heat & Gas Electrical Generating Stations Co., Ltd., which owns many of the waste-heat stations. All the power generated in these stations is taken by the three companies and distributed amongst their consumers, and the companies pay a small price for the energy, besides paying all the operating and maintenance costs connected with these stations. Continued progress is being made in the district, and the reports for 1909 of the two larger companies record an increase in the horse-power connected of 23,420 h.p. over that at the end of the previous year. The connections to the Newcastle Co.'s system at the end of 1909 amounted to 129,219 h.p., and those of the Durham Co. to 35,024 h.p. This progress has been made in spite of the depression in manufacturing business generally, and the unsettled state of the coal trade.

As illustrated in the accompanying map, the network of mains now spreads over a large area between Blyth in Northumberland and Loftus in Cleveland. It consists of some 300 miles of three-phase H.T. cables laid underground on the solid system and some overhead lines. The cables from Blyth run through the eastern portion of the Northumberland coalfield, through Tynemouth and North Shields into Newcastle. The main cables south run through the East Durham coalfield to Billingham, and from there through Stockton into Middlesbrough. Duplicate cables run from Middlesbrough to Grangetown, and from there into the iron mines district. Another route from Newcastle runs along the main road from Gateshead to Durham. From Durham a 20,000-volt cable connects the northern systems and the southern system at Weardale. These two main lines running north and south are interconnected at various points. Other connections have been made, so that there are duplicate routes interconnecting the north and south systems. The chief coal-burning power stations are Carville, Philadelphia, Neptune Bank, Dunston, Hebburn, and Grangetown. At Blaydon, Newport, Weardale, Bankfoot, and Tees-

GENERAL MAP OF NORTH-EAST COAST POWER SUPPLY SYSTEM.

bridge, there are waste heat stations running at their full capacity day and night.

The Newcastle Company is hurrying on the completion of the 30,000 h.p. generating station at Dunston, as the demand for power is steadily increasing. This station will bring the total horse-power of the generating plant under the control of the company up to 115,000 h.p. During 1909, a trunk main was laid connecting the Carville power station with the Cleveland & Durham Power Co.'s system in Middlesbrough. The main overhead line between Durham and Crook, and the power station at the latter place installed for utilising the waste heat from the coke ovens of Messrs. Pease & Partners (who have motors installed aggregating 1,800 h.p.) have also been completed. An extension of the company's mains has been made in the

Digitized by Google

Northumberland area, where an additional cable has been laid between the Carville station and Blyth.

It is hardly necessary to point out that where a district has been covered with mains, there are usually considerable advantages in taking a supply from a power company over a private plant. In the north of England, even where collieries or works have waste heat, it usually pays to make an arrangement with the power company. This is obviously so where collieries have a surplus of waste heat, and make an arrangement with the power company for disposal of what would otherwise go to waste. Again, where they have not sufficient waste heat for their own requirements, it may pay to make an arrangement with the power company, as the latter can often make up the difference more economically than the collieries could, by installing separate plant. The same may also apply in the case of some iron works. In such cases the power company's system acts as a regulator to the consumers' installation. If at any time of day there is a surplus of waste heat, it is taken by the company, if at other times of day the consumers want rather more power, they take it from the company. The power company's system also acts as an efficient standby, and thus avoids the necessity of the consumer spending a large amount of money on spare plant. This standby is particularly useful at week-ends and on holidays, when possibly a consumer only requires a very small amount of power, and where it would not pay to keep the men and labour necessary to run private plant.

It may here be of interest to quote the remarks of Sir Hugh Bell, in summing up the discussion on the Paper read by Mr. Merz at the meeting of the Iron and Steel Institute in Middlesbrough two years ago. Sir Hugh Bell recommended that anyone putting down his own generating plant should adopt the same system, as regards periodicity, for example, as that of the power company in the district, because, he said, "If he (the manufacturer) had any electricity to spare, the power company would buy it from him; if he wanted any electricity in addition the company would give it to him . . . if he liked to go to the company of the district and invite them to put down his power plant for him, they would put it down if they thought it would pay; if he thought he could make more money by putting it down himself and selling his surplus supply they were quite content." Even if a colliery or iron works, having a certain amount of waste heat, could find a consumer for it other than the power company, it would be difficult to get such a consumer to use his energy exactly when it was available, and in any case the consumer would be liable to be shut down at any time by strikes, or accidents at the colliery or works. Even if these difficulties were overcome, the colliery could not agree to supply anyone whose requirements were not well below the supply available, whereas by running in parallel with the power company's system no such margin is necessary, and it is possible to dispose of the whole of the waste energy.

There are now as many as fifty collieries taking power from the combined companies' mains. Foremost among these is the Harton Coal Co., Ltd., who have some 9,500 h.p. installed in motors distributed over five pits. The Lambton Collieries, Ltd., have some 1,000 h.p. in motors connected at Sherburn Colliery, and amongst the other collieries supplied are Messrs. Pease & Partners, Ltd., the Priestman Collieries, Ltd., and the Hetton Coal Co.

Where the colliery takes power only, and has no waste-heat plant, a small sub-station for transforming the current down from the supply pressure of 6,000 volts to the distributing pressure of 600 volts, is provided. This comprises four compartments, two transformer chambers, and two switchgear chambers, one containing the supply company's switchgear, and the other the consumer's switchgear. The supply is in duplicate, and one transformer and its switchgear can be isolated while repair work or cleaning is being carried out. Fireproof construction is used, and the transformer chambers are carefully ventilated.

Compensation for Colliery Fatality.—Judgment has been given by Sheriff Thomson, of Hamilton, in an action brought against Messrs. A. Russell, Ltd., for compensation for the death of J. Wallace, who was killed by electric shock in Dechmont Colliery, Cambuslang, in December, 1909. The deceased was working in a motor room underground, and came in contact with a coil of live cable which was hanging up. The judge stated that though the accident happened in the course of the deceased's employment, he had had difficulty in deciding that it had arisen "out of" his employment. In the absence of evidence that he was wrongfully contravening a rule of the pit, however, he felt constrained to draw the inference that it was so. He therefore found that the pursuers were entitled to compensation, which he assessed at £300.

ELECTRIC POWER IN A LEAD MINE

ON Monday, July 25th, the members of the Cumberland branch of the Association of Mining Electrical Engineers visited the Glenridding Lead Mines, Ullswater. The power station is equipped with two water turbines of 100 b.h.p. each, working under a 300-ft. head of water obtained from Helvellyn, about two miles distant, through 15-in. cast-iron pipes. The turbines were supplied by Messrs. Gilkes; one is a 1,000 r.p.m. vortex-type turbine and was installed in 1891, and the other, a pelton wheel running at the same speed, was supplied in 1898. The generators are 70 kw., 600-volt D.-C., compound-wound, belt driven at 600 r.p.m. Each feeds two pairs of mains, 19/15 B.W.G., which carry the current to the mines 2¼ miles distant, part of the line being overhead. The cables in the mine are rubber insulated and carried on insulators. Underground there is an air compressor supplying air for rock drills at 60 lbs. pressure, and belt-driven by a 40 b.h.p. compound-wound motor. A 40 b.h.p. winding motor hoists the ore in cages from the lower levels to the adit level, where an electric locomotive takes the loaded wagons a distance of 1¼ miles to the surface. The locomotive is capable of hauling a load of 20 tons. The total depth of shaft is 450 ft. At the 60-fathom level there is a three-throw pump working under a 360 ft. head, pumping 3,000 gallons per hour, driven by a 10 h.p. motor; at the 90-fathom level there is a similar pump. The whole of the pumping water runs out of the adit by gravity. Underground there is a sub-station to convert from 600 volts to 250 volts for the locomotive, which derives its power from two overhead hard-drawn copper lines of 000 B.W.G. section. The locomotive has a series wound 20 b.h.p. motor, and attains a speed of five m.p.hr. loaded. The current is collected by two trolley-arms. The whole of the mine is lighted by electricity above and below ground. There has never been any person injured by electric shock since the introduction of electric power into the mines, and no serious breakdowns have occurred. At the surface is a generator supplying current at 300 volts for driving the locomotive, should any repairs be necessary to the sub-station underground; this machine is driven by a turbine, and the armature is so constructed that, when in series, it will give the higher voltage, and when in parallel, 150 volts for lighting the works at the surface. The various dressing machines are driven by water power.

After the visit Mr. W. H. Borlase, senr., of the Glenridding Mines, stated that in 1890 it was discussed as to which was the most economical power to use in working the mines. The Company had tried hydraulic power and compressed air, and after some discussion and a visit to an electrically equipped mine, it was decided—in March, 1891—to instal electric plant at a cost of £5,000, and by Christmas of that year the plant had saved the company £300 on their previous working. The plant had now been working for twenty years. Some few years ago it was decided to purchase an electric locomotive at a cost of £1,200. At the end of twelve months the locomotive effected an economy of £800, and since its installation had never lost a day's working.

Colliery Accidents.—On July 21st last, W. J. Barrett, a miner, was killed by electric shock at the Blaydon Burn pit of the Priestman Collieries, Ltd. It appears that a steam pipe which had been recently placed in the pit had pressed upon and broken another iron pipe containing a power cable, with the result that the insulation of the cable was damaged, and an adjacent telephone wire made alive at 260 volts. The deceased received the shock from the telephone receiver, and although the current was immediately cut off, artificial respiration proved of no avail. At the inquest, a verdict of accidental death by electric shock was returned.

An inquest was held at New Tredegar recently concerning the death of W. H. Brown, who was killed by electric shock at the Elliot Collieries of the Powell Duffryn Co. Evidence was given to the effect that the deceased had attempted to remove the oil tanks from some oil-switches underground without first having the current switched off, and that his hand had come in contact with the switch blades. A verdict of accidental death was returned.

A similar verdict was given at an inquest, held at Hengoed, on the death of J. Rossiter, a sinker, who was killed by electric shock at the Penallta Colliery, Cylla Valley. The deceased was moving a power cable from a spot where some shot-firing was to be done, and touched a portion of the cable where the insulation had been worn off.

REPORTS OF THE INSPECTORS OF MINES

ALL the reports of H.M. Inspectors of Mines for 1909 have now been issued, and it is of interest to note the increasing space which is taken up by electrical matters. We give below notes from portions of the reports dealing with electrical working taken from the general digest issued by the *Colliery Guardian*. We have not repeated details of accidents already fully reported in ELECTRICAL ENGINEERING.

East Scotland District.

Mr. R. McLaren reports that in this district 198 of the 283 coal-cutting machines in use are electrical, and of these, 128 are of the disc type. There were no fatal accidents due to electricity, but three non-fatal accidents took place. A drawer who was proceeding out-bye with a loaded tub, which left the rails and struck the cable, is said to have received a slight shock. While a coal-cutter attendant was lifting a new face cable, a short-circuit took place, causing a flame, whereby he was burned. Two men engaged at a coal-cutter received a shock by the machine becoming live, due to a faulty plug and socket. Two prosecutions were taken for contraventions of the electrical rules, but in neither case were the defendants found guilty.

West Scotland District.

Here again electric coal-cutters preponderate, being 153 out of 206; of these, 83 are disc, 58 are bar, and 12 are chain machines. An explosion of fire damp due to a plug connecting two lengths of cable being withdrawn when current was on occurred at Ferniegair Pit (see ELECTRICAL ENGINEERING, Vol. V., page 723). In addition to this accident, at which three persons lost their lives, Mr. Mottram reports three other fatal accidents due to electricity, entailing the loss of three lives during the year. In one case at Auchingeich Colliery an "unauthorised" man was handling a coil of wire with defective insulation (see ELECTRICAL ENGINEERING, Vol. V., page 742). In the second case a man at Dechmont Colliery, Lanark, made accidental contact with a live part of a lighting circuit fed by an autotransformer, and received the full voltage. The third fatality at Polmaise, Stirlingshire (see ELECTRICAL ENGINEERING, Vol. V., page 151), was due to a defective controller and insufficient earthing.

Newcastle District.

In the Newcastle district only 45 electrical coal-cutters are used against 178 compressed-air machines; 20 are of the disc type, 17 of the bar type, and 8 of the chain type. Mr. J. B. Atkinson does not mention any electrical accidents in his report.

Durham District.

Mr. Bain writes that the number of coal-cutters has decreased by 40 since the previous year; 67 are driven electrically, and 68 of compressed air; the disc and bar machines are about equally divided. There were two fatal and three non-fatal accidents due to electricity underground. In one fatal case, at Shildon Lodge Colliery (see ELECTRICAL ENGINEERING, Vol. V., page 833), a man attempted to tighten up a live terminal nut behind a switchboard. At Murton Colliery a man received a shock when removing an adapter from a lamp-holder, but was revived by artificial respiration; another non-fatal case was due to a coal-cutter driver allowing his machine to run over and damage the trailing cable. A case of an oil-immersed controller catching fire is also reported.

Yorkshire District.

In Yorkshire 123 electric coal-cutters, mostly of the disc type, were in use, against 135 compressed-air machines. A larger proportion of the machines are electrical than formerly, but the total number of them has decreased. Mr. Pickering has in previous reports expressed an unfavourable opinion as to the dangers of electrical working, and points to the Ackton Hall Colliery explosion (see ELECTRICAL ENGINEERING, Vol. VI., pages 8 and 120), which was caused by a defective switchbox, to corroborate his fears. He does not, however, report any other electrical accident in his district.

North and East Lancashire and Ireland District.

Thirteen electric cutters are now in use in the Manchester district, against 111 compressed-air machines, and one electric cutter is used in Ireland. One electrical accident is recorded by Mr. Gerrard, and this only entailed slight injury to a man who carelessly touched a live part of a switch at Bradford Colliery. At Mr. Nelson's inquiry into this occurrence, several unsatisfactory features of the installation were discovered, and have been rectified.

Liverpool and North Wales District.

Mr. H. Hall remarks that the use of coal-cutting machines makes a larger output possible for a more limited area of working face, and in thin hard seams effects a considerable economy. The managers of a particular group of collieries express themselves satisfied with the practical results obtained by machine coal cutting, and are disposed to rely more and more upon that method in preference to manual labour. The Inspector considers that compressed-air coal-cutting machines might be applied more economically if advantage was taken of the electric haulage motors to work compressors underground. These motors are not required for haulage during the night, and they are thus at liberty to be coupled up to air compressors. The total number of coal-cutters in use in the district is 139, but only 13 are driven electrically. The only electrical accident mentioned is that at Wynnstay Colliery, Ruabon, of which particulars were given in ELECTRICAL ENGINEERING, Vol. V., page 237. Electric haulage, remarks the Inspector, is becoming very general in the mines, and greater care and skill have been exercised in the more recent installations. Electric power has great advantages; it is easily applied and very reliable; and where the mineral is being worked at long distances from the shaft, the haulage can be done in steps, thus avoiding the necessity of using very long and heavy ropes. Perhaps the gravest danger in connection with the application of electricity for motive power in collieries is the possibility of fires being started in main intake air-ways through accidental damage to the conducting cables and consequent short-circuiting.

Midland District.

In this district 106 electrically driven coal-cutters are at work, compared with 89 compressed-air machines; 48 of the electrically driven cutters are of the disc type, and there are 25 bar, 30 chain, and three rotary heading machines. Four persons were killed by electric shock in three accidents. One of these at Newdigate Colliery was due to a haulage rope becoming live through leakage. The second accident was that at Clifden Colliery, described at some length in ELECTRICAL ENGINEERING, Vol. V., page 667. The third accident, at Denby Colliery, was described in ELECTRICAL ENGINEERING IN MINES, December 2nd, 1909, page xiii. Among five non-fatal cases of shock is mentioned one caused by an inquisitive man putting his thumb into an empty lampholder, forming part of a circuit of several lamps in series. Another fatal accident is mentioned which was probably due to shock from a gate-end box of a design that has since been superseded. Mr. Walker remarks that there is a tendency amongst users of electricity, when it is pointed out to them that their systems do not comply with the requirements of the electricity special rules, to reply that as the installations were in use before the rules came into force they do not apply to them. It seems that, seeing the rules have now been established close upon five years, there has been ample time to bring the old installations up to the standard required by the rules, and there should now be no installations which do not comply with them. In many cases such small matters as the protection of fuses not placed within 2 ft. of the floor, providing efficient gate-end boxes and earthing same, have not received any attention. He has, in consequence, in some instances, given the agents and managers notice to comply with the rules. At many collieries the management, in addition to complying with the electricity special rules under the Coal Mines Act, have drawn up instructions for the guidance of those who have charge of the plant on the surface and in various parts of the mine.

Stafford District.

Mr. H. Johnstone records the use of 25 electrical coal-cutters, and 28 compressed-air machines. At Hamstead Colliery a deputy was injured by the exploding of an electric relighter when lighting a safety lamp. The apparatus consisted of the usual cubical cast-iron box, surmounted by two concentric cylinders, the inner of which, in which the lamp to be lighted was placed, could be revolved within the outer one. The cast-iron box contained the accumulators and a zinc box enclosing the induction coil, and was closed by a gas-tight door. It is believed that in moving the apparatus about some of the acid in the accumulators had been spilled, and had come in contact with and corroded portions of the zinc box. Sufficient hydrogen had thus been evolved to render the air in the cast-iron box explosive, and the spark from the induction coil, resulting from the passing of the current to light the lamp, ignited the mixture. The explosion burst the box, the sides of which were $\frac{3}{8}$-in. thick. Since this accident occurred, the makers have radically altered the design of the apparatus with a view to the elimination of the risk of similar accident. Only one non-fatal accident by electricity on the surface was reported. A motor driving a coal screen and belt was stopped on full load for some temporary purpose. When signalled to re-start, the motor-man thoughtlessly neglected to shift the driving belt on to the loose pulley, and attempted to start against the load by throwing the switch over into the "running" position. Realising his mistake, he switched off at once, causing an arc and flash which burned his hand and wrist.

Digitized by Google

Cardiff District.

Only six electrically driven coal-cutters and 21 compressed-air cutters are in use, and Mr. F. A. Gray remarks that coal-cutting machines have not made much headway in the district. They are not needed in the thick steam coal seam, as generally the coal is easily worked, and in some seams there is considerable difficulty in keeping it up until required down. A serious fire at Blaenant Colliery was probably caused by a short-circuit on a motor, setting fire to some oily woodwork, but neither underground nor on the surface was anyone killed or injured by electric shock.

Swansea District.

Mr. J. Dyer Lewis writes that the introduction of labour-saving coal-cutting machines is not so rapid as in the other districts. The many thin seams of the district where holeing is a laborious and dangerous operation could be more economically and safely performed by the different types of machines now on the market. The number of electrically driven cutters was 18, against six compressed-air machines. A fatal explosion of fire damp at Caedan Colliery, which appears to have been due to sparks from a motor, was described in ELECTRICAL ENGINEERING, March 3rd, page 151. Another accident, said to have been partly due to electricity, was that at Tareni Colliery, where an in-rush of water had carried away the supports of the cables, and some men, in endeavouring to escape from the water, are reported to have received shocks, although there is some doubt upon the matter (see ELECTRICAL ENGINEERING, January 27th, page 56). Two other fatal electrical accidents are reported in the district. One of the fatal cases at Ynyscedwyn Colliery was due to a hauler attempting to connect a broken lighting cable. The other fatal case, in which two lives were lost, was at Cribbwr Fawr Colliery, Cornwall, owing to a cable having been damaged by a runaway tram (see ELECTRICAL ENGINEERING, Vol. V., page 766). Two non-fatal accidents are also reported. An electrician was injured at Maesteg Deep Colliery power station by a short-circuit between two brushes, causing a flash, which burned his fore-arm. A pumpman at Tirydail Colliery, Carmarthen, also received a shock, owing to a signal wire becoming live by contact with a cable that had been damaged by a tram.

Southern District.

Mr. Martin gives the electrical coal-cutters in use as nine, and the compressed-air machines as 14, and states that no fatality from electricity occurred.

EARTHED CONCENTRIC CABLES FOR COLLIERIES

A PAPER entitled "The Earthed Concentric System for Direct-Current Colliery Cables," by Mr. W. Bolton Shaw, was read on May 28th before the Lancashire Section of the Association of Mining Electrical Engineers. The author commenced with some general remarks on the covering of cables, laying stress upon the necessity for adequate protection of the insulating material, especially underground. The most obvious way was the provision of a metallic covering. The objection to lead for this purpose was that, of all ordinary metals, it was least able to resist cutting, puncture, abrasion, or deformation. Iron or steel strips distributed the effect of a blow over a larger area of the insulation beneath, but added nothing to the longitudinal strength of the cable. Wire armouring wound with a long lay was the best form of protection, and allowed the cable to be strongly gripped by clamps for anchoring purposes. Armouring, however, added in some ways to the danger from shock unless efficiently earthed. Concentric cables were preferable to separate cables for each pole, on the score of cheapness and compactness, as well as less self-induction; they were also preferable to single cables with twin conductors.

If the outside earthed metallic layer or armouring is used as one of the current-carrying conductors, the cable can be made as a single-core armoured cable, and it was this arrangement that the author favoured for direct-current colliery work. It practically halved the fuse and switchgear, making it single-pole, and reduced risk of breakdown and cost of repairs. It also reduced the risk of danger by making continuity of the armouring one of the essentials to supply. The system had been largely applied in Scotland, and also to a considerable extent in this country. Leakage was easier to detect, as it led to a complete short circuit quicker, and isolated the faulty circuit, and in the author's opinion the risk of fire from a momentary short-circuit confined within an earthed envelope was less than from continued leakage. The armouring also provides a substantial visible conductor to which motor frames, switches, cases, &c., can be connected for earthing. The principal disadvantage of the system is the fact that, as the armouring carries current, there is a fall of potential along it. If, therefore, the system is earthed only at the negative bar on the main switchboard as it ought to be, there will be an appreciable difference of potential between the far end of the armouring and earth, and this may be sufficient to cause slight sparking on contact between the cable and pipes, rails, &c. A light form of insulation, such as a layer of compounded jute, can be used to obviate this, although, if motor frames are earthed to the cable, the objection may still apply. The author is doubtful, however, whether the risk involved is really appreciable. At the colliery with which he was formerly connected the system was in use, and earthing of the coal-cutters to the cable was at first avoided for this reason, but later experience with them earthed in this way has not shown that the fear was justified.

A substantial earth connection should be made to the negative bus-bar on the main switchboard, and taken to two independent earths. The negative terminals of the generators should be connected to the bar through circuit-breakers, but there must be no other joint on the negative side where the circuit can be broken. All motor-starters, &c., must, of course, be on the positive side.

The author passed on to a consideration of coal-cutter trailing cables, which are a fruitful source of accident. They should be as flexible as possible, able to withstand crushing. Ordinary armouring is too stiff, but a concentric layer of fine copper wires used as the return will give the required flexibility. It is desirable to have a thick padding of jute or other soft and tough material between the insulation of the inner conductor and the outer, and also to lap the insulation of the outer conductor with a similar padding, and to have over all a durable covering that will not easily cut. The plugs must be so designed that it is impossible to get them into the sockets the wrong way.

So far, no mention has been made of lighting. The concentric system has the same advantages when applied to lighting as for power, so far as the larger main cables are concerned, but for the branch circuit wires, which have to be tapped and jointed at frequent intervals, the large number of bonds required and their flimsiness, owing to the small size of the armouring, introduces considerable risk of discontinuity, and it is preferable to carry out this portion of the installation with ordinary insulated wire on both sides.

It was an open question whether a separate lighting system should be put down, or lamps run in series from the power mains. The former was in many ways preferable, but involved much great cost in the provision of separate cables.

DISCUSSION.

Mr. R. AINSWORTH said that he had been under the impression that the concentric system was a thing of the past, owing to difficulties of jointing at the boxes. He thought that a separate lighting installation was ideal, but too expensive, and in this the next speaker, Mr. W. WINSBOROUGH, agreed.

Mr. S. LEA had seen a number of installations on the concentric system in Yorkshire working well, and several in Lancashire which were just the reverse. He thought that concentric cables were difficult to repair, and pointed out that it was impossible on the earthed concentric system to watch any change in the insulation of the system, as could be done with the ordinary system on a leakage indicator. He also referred to the possibility of sparking from the coal-cutter wheel and firing the finely divided coal dust.

Mr. STEVENSON spoke of a case where the earthed concentric system had been given up owing to consulting engineers advising its replacement by three-phase working. The drop of potential on the armouring sometimes amounted to as much as 45 volts.

Mr. NEWTON referred to where a fatality was due to a portion of an earthed concentric system having been replaced by two single insulated wires. Accidents had also been caused through fuses being placed on the negative side.

One or two other members also spoke, and Mr. Shaw, in reply to Mr. Lea, pointed out that the leakage indicator was of little help in telling which circuit the fault was on, and dwelt at some length on the greater safety and durability of the system which he was advocating.

AMERICAN REGULATIONS FOR ELECTRICITY IN MINES

ENDEAVOURS are being made by the Mine Inspectors' Institute of the United States, to bring about uniform legislation relating to electricity in mines throughout the United States, on the lines of the mining laws of the State of Ohio, which came into force during last June.

According to the *Electrical World*, the code of electrical rules laid down by the Ohio Legislature requires that mine inspectors shall have a practical knowledge of the uses and dangers of electricity as employed at mines. Although in general, inspectors have the right to order any condition around a mine which they deem dangerous to be changed, the approval of the chief mine in-

Digitized by Google

spector must be obtained before changes in electrical wiring or electrical applications can be required. Among the safety appliances stipulated by the Ohio law is a supply of portable electric lamps energised from storage batteries. No steam boilers are permitted within 60 ft. of a mine opening or a wooden building communicating with the mine opening. Trolley wires in mines must be carried at least 6 in. outside of and parallel to the track rail, must be separated by at least 6 in. from the roof timbers, and be supported at intervals not exceeding 25 ft. No trolley wire shall be extended into a room which is being used as a working place. Switches and circuit-breakers must be installed to control the electric circuits at all important points in the mine. No electric wires shall be extended into any room unless a cable 150 ft. in length will not reach the face of the room. Positive machine feed wires must not be extended nearer than within 4 ft. of the track, and must be disconnected when not in actual use. The return or negative line may be bonded to pipes or rails, but a pipe must not be exclusively used for the return circuit.

The voltage of direct-current circuits used to operate gathering locomotives, mining machines, shearing machines, drills, and other apparatus in working places, must not exceed 325 volts measured at the switchboard. In the case of mines newly equipped with electricity, no alternating current shall be used underground to operate any machinery other than that necessary to convert the alternating current into direct current. Alternating-current mains must be provided with a separate conduit way which is not traversed by men or animals. Where haulage locomotives, pumps, or machinery are not located in or about working places of the mine, direct-current pressures exceeding 325 volts may be used, in case the entry or passage ways where lines are carried are not permitted to be used as a principal course of travel. However, no pressure above 650 volts at the switchboard shall be used underground under any circumstances.

MINING CABLES AND ACCESSORIES

THE British Insulated & Helsby Cables, Ltd. (Prescot, Lancs.), have sent us an extremely interesting volume of 160 pages, which, although nominally a catalogue of bitumen cables and mining accessories, contains a large amount of useful information.

As is well known, bitumen-insulated cables have a great advantage for use in shafts, owing to their being comparatively light and easy to handle. The company state the special properties of their vulcanised bitumen enable them to use a thinner dielectric than is usual with this class of material, with a consequent saving in diameter. The dielectric strength is, however, high, and the cables pass the tests prescribed by the Engineering Standards Committee. If desired, stranded conductors have the interstices filled with compound to prevent water travelling along the conductor from the ends or in case of breakages. The company's multi-core cables are normally supplied with wormings of jute impregnated with a special wax, but if desired these wormings are made of vulcanised bitumen as the remainder of the insulation.

The book is extremely well illustrated with coloured drawings of the various types of cables, and we particularly admire four excellent reproductions of four different types of V.R. trailing cables, hard, core braided, close spiral wire armoured, steel strip armoured, and spiral roped. Wires for shot firing are also included, with descriptions of the various types, and also cables with weatherproof braiding for overhead use on insulators. In the latter part of the book, various accessories are described, including a special pattern of shaft cleat, and junction boxes in which particular attention is paid to the method of bonding. This latter is illustrated by a clear drawing. A good portion of the list is also devoted to overhead material, and there are sections on mine exploders, bells, telephones, &c. The last pages of the volume contain the Home Office special rules for the installation and use of electricity in mining.

We have no doubt that the British Insulated & Helsby Cables, Ltd., will be only too pleased to send copies of this list to any of our readers who have charge of the erection or maintenance of electrical work in mines.

MINING PATENTS OF JULY

AMONG the patents of interest to electrical mining engineers, published during last month, was No. 14,352 of 1909, by W. C. Georgi and A. Reyrolle & Co., Ltd., of Hebburn-on-Tyne, Durham, for a method of ensuring the immediate disconnection of a faulty three-phase feeder, and is especially suitable for mines where a fault between core and armouring may result in an external flame, and cause explosion of fire damp or coal dust. The generator neutral is earthed at the station, and the armouring of each cable is connected to the earthed neutral through an electromagnetic device which throws out the feeder switch in question should there be any leakage current.

Specification No. 28,532 of 1909, by H. J. Robinson and Messrs. Kynoch, Ltd., Witton, describes an improved electric fuse or detonator for blasting. This has a head of lead pressed on to the conducting wires, the head being enlarged where it is secured to the tubular body of the fuse. An extension of the head forms a recess for the flashing mixture, and a sealing disc is provided for retaining the mixture in position in the recess.

A third specification, No. 18,864 of 1909, by S. Kraus, of Berlin, describes an electric miners' safety lamp constructed so that it can be opened only by means of a magnet in a special enclosed chamber. A glass cover over the lamp can only be removed when the lamp casing is opened. Other details are described, including an adjustable reflector and lamp holder.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during July.

July 7th.—Supplement on "Electrical Engineering in Mines," opening with an article on the International Mining Congress at Dusseldorf, where a number of Papers relating to electrical mining work were read. Reports are also given of two papers read and discussed before the Mining Institute of Scotland at Dunfermline, one by Messrs. Crawford and Moores on gas-driven generating plant, and the other by Mr. F. Anslow on electric power in collieries. A description of an electrical winding plant in France is also given. Attention is drawn to a recent discussion upon inspection of mines in Parliament, and a report is given of the discussion on a Paper by Mr. W. Maurice on the battery plant at the Hucknall Collieries, and a short account of a discussion on earthing of colliery apparatus at a meeting of the Association of Mining Electrical Engineers. Some notes are also included on recent electrical mining patents.

July 14th.—Discussion on mains testing and fault localisation. Details of a new design of controller, and description of new electrical supplies and accessories.

July 21st.—Reviews of new books. Note on a method of testing feed-water.

July 23rd.—Illustrated description of the electrical equipment at the Barrow Hematite Steel Works. Particulars of a new line of knife switches.

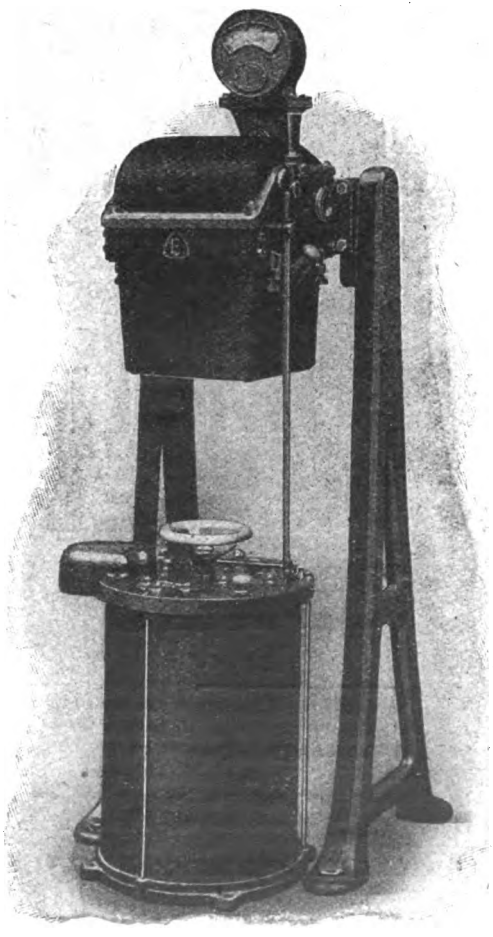
PHŒNIX

GEARED MOTORS



BRADFORD . . . 952 Central.
LONDON . . . 1061 Victoria.

IMPORTANT!

The strong, heavy sub-base in which the gearing runs, gives a solidity and freedom from vibration quite unattainable with a top geared type machine. Our Bulletin E E 1, shows many examples of recent PHŒNIX EQUIPMENTS.

PHŒNIX DYNAMO MFG. CO., Ltd., BRADFORD.

MINING SWITCHGEAR

A totally enclosed "Foolproof" Panel, consisting of a Triple Pole oil immersed double automatic Circuit Breaker, mechanically interlocked with an oil immersed Rotor Starter. Complete with Ammeter and Stand as shown, suitable for a 50 H.P., 500 volts, 3-phase slip-ring motor.

Price £31 : 0 : 0 (Subject).

SUMMER MEETING OF THE INSTITUTION OF MECHANICAL ENGINEERS

THE summer meeting of the Institution of Mechanical Engineers was held last week in Birmingham and London, in conjunction with the American Society of Mechanical Engineers. At the meetings on Tuesday and Wednesday last week, in Birmingham, there was not much of electrical interest. In a paper on "English Running Shed Practice," by Mr. Cecil W. Paget, General Superintendent of the Midland Railway, Derby, the question of English running shed lighting was referred to, and the opinion was expressed that metal filament lamps will eventually supersede gas for this purpose, as hitherto such large units of light as arc lamps have not been required for this purpose. In a paper on "High-Speed Tools and Machines to Fit Them," Mr. H. I. Brackenbury discussed to some extent the application of electricity to the driving of machine tools mainly in relation to variable speed motors, and pointed out that such motors worked on the direct-current three-wire system give a large range of speed, but at certain speeds with light cuts the efficiency of motor and machine might be far from good. Curves were given of the electrical horse-power at various speeds for a large lathe, which showed that there is a drop in efficiency at the change from the low voltage to the high voltage, and an extra gain in efficiency when a change is made from the high voltage and high gear-ratio to the low voltage and low gear-ratio, the result being that practically the same amount of power has to be paid for at cutting speeds of 18 and 33 ft. per minute. The motor was rated at 40 h.p. on the high voltage, so that in one case the motor was giving from 50 to 75 per cent. of the full load, and in the other case from 25 to 35 per cent. of the full load. The conclusion drawn by the author was that heavy lathes required to do both light and heavy turning should have the gear-ratio arranged so that the full range of speed may be obtained from either voltage, and that builders of such heavy machines should give the total efficiency of the lathe and motor at various speeds and loads.

Electrification of Suburban Railways.

Mr. F. W. Carter (Rugby) in this Paper, pointed out that many of the railways of this country have, so far as their suburban passenger traffic is concerned, been affected very adversely in recent years by the great and increasing competition of tramcars and motor-omnibuses. The companies concerned appear undecided at present between giving up a great portion of this class of traffic permanently and endeavouring to regain it by electrification of their suburban lines. The latter expedient, although an expensive one, has hitherto invariably been found successful in regaining much of the lost traffic, and the problem confronting a company in regard to any section of its suburban lines is than of determining whether the expected gain from electrification will justify the expense to be incurred. He indicated a method founded upon the theory of probability by which the profit likely to accrue could be roughly predicted from the results of known undertakings which, while subject to considerable uncertainty, is likely, if properly interpreted, to be of much greater value than a figure derived from a simple estimate of the increase of traffic. It has generally been found hitherto that the increase in traffic due to electrification has exceeded the estimates formed of it, and examples of this are given from the cases of the Lancashire and Yorkshire North Eastern Railway, and was also mentioned that on the electrically worked section of the London, Brighton and South Coast Railway the increase in passengers carried during the first two months was, as compared with the corresponding months of the previous year, 63 per cent. The electrification of a steam railway can, of course, be considered commercially expedient only when the estimated net profit under electrical operation exceeds that under steam operation by more than the interest on the extra capital involved. It is chiefly the burden of capitalisation which limits electrification to lines of heavy traffic.

An indispensable requirement to the success of any system for working suburban traffic is immunity from all forms of breakdown competent to delay the service. In this respect modern electric railway apparatus, the design and construction of which has been developed by arduous experience, if chosen with reference to the nature of the service and maintained with care, leaves little to be desired. Figures are given in some detail to show that the delays from all causes, electrical and mechanical, for the month of December, 1909, averaged about 33 seconds per day per train on the District Railway, and only 2½ seconds per day on the Underground Electric Railways tubes. The total cost for maintenance and repairs of rolling stock on these lines does not exceed 0·6d. per car-mile.

The railways in this country operated wholly or in part electrically are eighteen in number, working over a total of approximately 200 miles of route and 410 miles of track. The trains are worked by 87 locomotives and 821 motor-coaches. The aggregate nominal power of the driving motors is approximately 360,000 h.p. Brief summaries of the principal features of these lines, all of which have been described from time to time in the technical press, are given in the Paper.

In suburban service the greater part of the energy-input is used in accelerating the train, and the energy-consumption per ton-mile depends principally on the nature of the schedule. Thus the figures derived from test of 42 watt-hours per ton-mile for the energy-consumption of the Central London Railway, and 137 watt-hours per ton-mile for the Liverpool Overhead Railway, indicate no more than totally different services on totally different railways. A better measure is the uniform acceleration that would cause the train to reach the mean running-speed in a distance equal to the average distance between stations. This acceleration is greatest for the Liverpool Overhead Railway's schedule, a fact which explains the high energy-consumption per ton-mile. The following table gives some characteristic schedules arranged in order of the specific acceleration :—

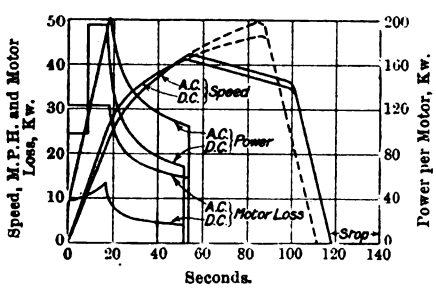

FIG. 1.—COMPARATIVE CURVES FOR A.C. AND D.C. MOTORS.

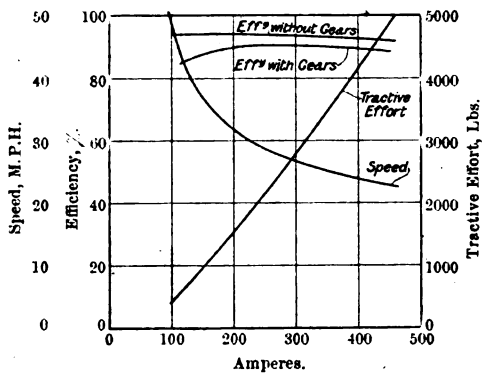

FIG. 2.—CONTINUOUS-CURRENT MOTOR CHARACTERISTICS.

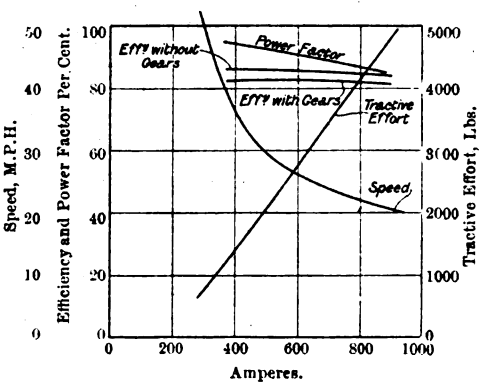

FIG. 3.—ALTERNATING-CURRENT MOTOR CHARACTERISTICS.

Digitized by Google

Line.	Average distance between stops.	Schedule speed.	Time of stop.	Average speed excluding stops.	Specific acceleration.
	feet.	m.p.h.	secs.	m.p.h.	m.p.h. per sec.
Liverpool Overhead	2,145	19·5	11	22·9	0·179
Liverpool-Southport	6,535	30	15	33·4	0·125
Underground, Inner Circle ...	2,555	15·7	20	19·2	0·106
Baker Street and Harrow ...	5,000	23	20	26·6	0·104
South London Elevated ...	4,540	21·5	20	20	0·101
Hammersmith and City ...	2,830	16	20	19·2	0·096
Central London	2,540	14·7	20	17·7	0·090
North-Eastern, Tynemouth	6,000	20·5	30	24·1	0·071
Midland, Heysham-Morcambe	23,500	26·7	120	33·4	0·035

The performance of a given electric train under given conditions of suburban service can be closely predetermined. Schedule calculations, however, are inadequate by themselves to determine the question of the suitability of an equipment, as the limiting features are usually connected with the heating of the motors, which again depends on the energy-loss in the motors. The ultimate temperature rise of the hottest accessible part of an ordinary railway motor, totally enclosed and without forced ventilation, as measured by Centigrade thermometer after continuous service, is approximately equal to $7 W w^{-\frac{2}{3}}$, where W is the mean motor loss in service (not including gear loss) in watts, and w is the weight of the motor in lbs., excluding gear and gear case. The motor losses in suburban service usually take from 6¾ per cent. to 7 per cent. of the input to the driving equipment in the continuous-current system, and from 15 per cent. to 18 per cent. of this input in the single-phase system. The equipment losses during acceleration are of the same order of magnitude in the continuous-current and the single-phase systems, in spite of the rheostat losses in the former system. The great motor losses incident to the single-phase system form the foundation of all the objections raised to the use of this system for suburban service. The heating of the motors has always been a limiting feature in this class of service, and means of dealing with it are well understood. The use of forced draught for cooling the motors, whilst practicable for locomotives and single cars, is out of place on multiple-unit trains, where, since the equipment may not be inspected for hours together, it cannot, in the author's opinion, fail to lead to breakdown.

Fig. 1 gives speed, power and motor-loss curves corresponding to typical suburban schedule runs with continuous-current and with single-phase equipments, the former of which carries 20 tons per motor and the latter 23 tons. Figs. 2 and 3 show the corresponding motor characteristics. The great difference between the systems is in the motor loss, which amounts to 6·75 per cent. of the input in the continuous-current case and to 17·8 per cent. in the single-phase case. Although both motors are dynamically capable of working the service, the former alone has sufficient thermal capacity for the purpose, the other having to dissipate three times as much energy as it can get rid of by natural cooling.

There appears little prospect of general electrification of the railways of this country, as no advantage is apparent which would in any way justify the expense. It is only in the case of heavy suburban service that there is prospect of commercial advantage accruing from electrification, and whilst there may be other local opportunities for electrical working, there is at present no indication that the steam-locomotive can be superseded with advantage for ordinary main-line work.

Continuous-Current v. Single-Phase Equipments for Suburban Traffic.

Mr. H. M. Hobart contributes a paper in which he compares the commercial results which may be expected to be obtained with continuous-current and single-phase trains respectively on certain schedules. The author considers that in this country, where coal is comparatively cheap, steam traction is more economical for long-distance through trains and general traffic, but that electric traction has proved its superiority for suburban passenger service. Assuming that the cost of the electrical equipment of the track is the same for both the continuous-current and single-phase systems, Mr. Hobart proceeds to compare the total charges in connection with the rolling stock alone. He takes the cost of the electrical energy delivered at the trains at 0·72d. per kw.-hr. for the single-phase system and 0·90d. per kw.-hr. for the continuous-current system, the cost delivered to the substations being 0·65d., and the differences representing the charges in respect of substations and the contact conductor losses.

With trains consisting of three double-bogie coaches, the gross receipts are usually, continues the author, some 40d. to 60d. per train mile. The cost of the electrical energy consumed, and the capital and other running charges, amount to from 35 to 40 per cent. of these gross receipts, and it is these which are influenced by the electrical system employed. As an example, the case of two 150-foot trains, each consisting of one motor-coach with two motors, and two trailer-coaches, may be taken. The continuous-current train is that employed on the Piccadilly tube in London and weighs 61 tons, and the single-phase train is that of the Heysham and Morecambe line of the Midland Railway and weighs 77 tons. Mr. Hobart shows that though the services are different, the average output to the axles is about the same in the two cases, and on the assumption of an average overall efficiency of 70 per cent. in both cases, figures are deduced from the published weights of the electrical equipments (8·0 and 14·9 tons respectively) to prove that the average output in service per ton of electrical equipment is 10·9 h.p. in the case of the continuous-current equipment, as against only 6·0 h.p. for the single-phase equipment.

Continuing, the author makes an analysis of two 180-ft. trains, each composed of two motor-coaches with four motors each and one trailer coach. The continuous-current train is that of the Southport line, weighing 118 tons, and the single-phase train is that used on the South London Elevated, with a weight of 138 tons. The services are somewhat different, and the author states that the power required at the axles is 42 per cent. greater in the case of the Southport train, notwithstanding the greater weight of the South London Elevated train. The weights of the electrical equipments are 30 and 44 tons respectively, and the average horse-power output to the axles per ton of electrical equipment works out at 10·6 h.p. for the Southport train and only 5·12 h.p. for the South London Elevated train. Thus in the two cases dealt with, the single-phase equipments weigh about twice as much as the continuous-current equipments. It has been asserted, continues the author, that this does not seriously affect the total train weight, but the electrical equipment of the Southport train amounts to 25·4 per cent. of the total weight, as against 32 per cent. of the total weight for the much less severe South London Elevated service. If the Southport service were run with single-phase trains, the electrical equipment would, Mr. Hobart estimates, weigh 45 per cent. of the total weight of the train. Conversely, a continuous-current equipment for the South London Elevated service would weigh only 35 per cent. of the present single-phase equipment, or less than 12 per cent. of the total weight of the train.

Turning to the cost of these equipments, the author assumes a figure of £125 per ton in both cases, which makes the single-phase equipment for the South London Elevated service cost £5,500, as against £1,910 for a continuous-current equipment for the same service. The total costs of the two trains work out at £11,325 and £7,515 respectively.

In comparing the running charges, Mr. Hobart takes two different services, one with a schedule speed of 30 miles per hour and an average distance between stations of 1·32 miles, and another with a schedule speed of 22 miles per hour and an average distance between stations of 0·88 mile. The annual average mileage per train is taken at 54,000 miles and 48,000 miles respectively. The annual charges for interest, depreciation, repairs and renewals for the trains only are assumed at 15 per cent. of the cost. Gross receipts are taken as 50d. per train mile, and from these figures Mr. Hobart concludes that the percentage of the gross receipts which could be set aside as profits would, for the 30-mile-per-hour service, be 12·45 per cent. greater with the continuous-current than with the single-phase system. For the 22-miles-per-hour service they would be greater by 6·7 per cent. Thus, for suburban traffic where the service is severe the continuous-current system has a very decided advantage. In conclusion, the author refers to the fact that recently some single-phase equipments in America have been replaced by 1,200 volt D.-C. equipments, which would show even better results than the above 600-volt D.-C. equipments.

The 1,200-Volt Direct-Current System.

Mr. W. B. Potter, Chief Engineer of the General Electric Co., of Schenectady, contributed a paper in favour of direct-current working. With regard to a universal system, he asserts that this is out of the question on account of the difference in the requirements of a congested suburban service and the comparatively infrequent main-line service. He

Digitized by Google

insists on the higher first cost of alternating-current equipments, and asserts that the total energy consumption of a single-phase system is often nearly the same as that of a corresponding direct-current system, the greater weight and the lower efficiency of the single-phase equipments offsetting the rotary converter and third-rail losses of the direct-current system. After enumerating the conditions which should determine the choice of the system, the author points out that for grades up to 1½ per cent. there is little difference in the relative value of the systems; with steeper grades the conditions will be more favourable to the A.-C. systems. Light trains with multiple-unit working are favourable to the D.-C. system, but, except where locomotives are used, A.-C. working is more suitable for heavy trains. Frequent service is best dealt with by D.-C. working, infrequent service by A.-C. working. Variations in schedule make little difference ordinarily, but in the extreme case of high schedule speed with short runs, D.-C. working is imperative. In the author's opinion, the comparative results obtained up to the present are in favour of D.-C. working. For main-line service, he continues, a pressure of 1,200 volts D.-C. will be used, but a still higher pressure will be required for heavy intermittent service, and whether this will be 2,400 volts D.-C. or 11,000 volts A.-C. cannot yet be determined.

Continuing, the author asserts that the application of the single-phase system has been arrested in the States owing to a general recognition of its limitations, among which he places excessive weight and cost of rolling stock, high maintenance charges, increased energy consumption, rapid depreciation, and increased cost of maintenance of track. He then works out in detail the cost of converting a 100-mile interurban line with a low traffic frequency of one train in each direction per hour. Three systems are considered, 600 volt D.-C., 1,200 volt D.-C., and 6,600 volt A.-C. Particulars of the equipment, capital cost, and maintenance figures are given in each case, and the conclusion is arrived at that the 1,200 D.-C. system is the most economical. The annual cost of operating the line, including both capital and running charges, is given as £35,200 for the 600-volt D.-C. system, £30,400 for the 1,200-volt D.-C. system, and £38,500 for the 6,600-volt A.-C. system. Concluding, the author states that a great increase in the adoption of the 1,200-volt D.-C. system may be expected for this class of interurban line, and that it will not be surprising if the single-phase interurban system is entirely discarded in America unless some marked improvements are made and more economical equipments are available. The liability of breakdown and delay is centred, he says, principally in the equipment of the rolling stock, and this, therefore, should receive special consideration.

The Electrification of Trunk Lines.

Mr. L. R. Pomeroy (New York) at the outset of his paper with the above title, stated that whatever system of electrification is adopted, a very large outlay has to be faced, and no case for electrification can be made out unless an increase in net receipts or decrease in the working expenses can be secured more than sufficient to pay interest on the extra capital involved.

The author proceeds to a comparison of the relative cost of coal for steam and electric operation, based on coal at 9s. per ton for the steam locomotive, and 6s. per ton for the power house, and finds a saving of about 50 per cent. in favour of electricity, a figure borne out by the results on the Mersey Railway. On steep-grade railways the showing is still more favourable to the electric side.

Examples are worked out giving the cost of coal for a certain steam service at 4s. 10d. per 1,000 ton miles and 3s. 7d. for an equivalent electric service in one case, and 2s. 10d. and 2s. respectively in another case. Taking, however, the price of coal for the locomotive as 7s. 10d. per ton, the difference is slightly in favour of steam.

These figures apply to an undulating profile, when coasting is occasionally possible.

An article by Mr. C. L. De Muralt gives the annual saving that would be obtained by electrification of the Pennsylvania Railway as over £950,000, and for the New York Central as £787,000, on the basis of a saving in fuel of 10 per cent., water saved entirely, other supplies 50 per cent., wages, &c., 25 per cent., and repairs to locomotives 40 per cent. Large as these alleged savings are, yet they would not amount to more than 2½ to 3 per cent. on the necessary increase in capital to electrify the roads on which the foregoing savings apply.

It is further claimed that, with electric operation, greater mileage is possible with the electric locomotive and that fewer units are necessary to perform the same service. Stress is laid on the fact that the ordinary freight locomotive makes only 3,000 miles per month, against which is put forward the ability of the electric locomotive to perform practically continuous service, suggesting the propriety of comparing electric and steam operation on the basis of ton miles per annum each is able to make and also the relative weight on driving wheels and not their total weight.

The impression is quite prevalent that if 100 steam locomotives are required to operate a certain division, if operated electrically, a power station capacity the equivalent of 100 locomotives would be necessary, whereas the generator capacity, barring the installation of spare units, would be of such size as to meet the average load.

Some advantages which electric locomotives possess for moving freight trains faster in places where traffic is dense, are dwelt on, but electric operation as compared with steam shows to greatest advantage in urban and suburban passenger service. Here, if multiple unit trains are employed, so that a considerable fraction of the total weight is carried on the driving wheels, a schedule speed quite impracticable in steam operation can be maintained. A more frequent service can be given without a proportional increase in expense, whilst in times of light traffic small trains can be run, the energy consumption per train in such service being almost in proportion to the number of coaches.

Passing on to some examples, the author quotes authorities to show that the road service costs per 1,000 car ton miles on the New York Central were 13s. for steam against 8s. for electric working. The fixed charges on the power plant and the transmission system are 8s. 2d. per 1,000 car ton miles, or about the same as the saving, so that if the train movement were but one-half the assumed amount (averaging 6,000 horse-power at the rails, or 6,000 kilowatts at the station) the cost for electric service would be slightly higher than for steam.

The Manhattan Elevated, with about 38 miles of road, was electrified at an expense of £3,400,000. The operating ratio under electric conditions has been reduced from 61 to 46 per cent. of gross receipts. The net result after taking care of the increased capital, &c., shows 15 per cent. profit, but it is a significant fact that the increase in business was 46 per cent. (carrying about 250,000,000 people per annum, 690,000 per day average, or 28,800 per hour).

Another example is the Mersey Railway. The net profit, allowing interest, &c., on the increased capital due to electrification, amounted to 15 per cent., but it took an increase in traffic of 55 per cent. to make this operating result possible. Ton miles increased from 43 to 67 million, or 55 per cent. Total expenses, which include operating expenses and interest on electric capital (but not depreciation) equal 2s. 4d. per ton mile. Interest equals 5·1d. per ton mile, or 22 per cent. of operating expenses.

President Harahan, of the Illinois Central, reports the results of the investigation that has been made relative to the proposed electrification in the following words: "Our suburban traffic is the only service which would in any degree be adapted to electric operation, but even in this particular service it can be readily shown to be unjustifiable at the present time. Our suburban traffic is not sufficiently dense to warrant the expense necessary to electrify these lines, there would not be an increase in traffic sufficiently large to offset the annual loss from operation."

With regard to the New York, New Haven, and Hartford Railway, the following extract from a letter from the President of the Company is given: "We believe we are warranted in saying that our electric installation is a success from the standpoint of handling the business in question efficiently and with reasonable satisfaction, and we believe we have arrived at the point where we can truthfully say that the interruptions to our service are no greater, nor more frequent, than was the case when steam was in use. But we are not prepared to state that there is any economy in the substitution of electrical traction for steam; on the contrary, we believe the expense is very much greater."

Plea for a Universal System.

The paper contributed by Mr. George Westinghouse, President of the American Society of Mechanical Engineers, emphasises the necessity for the early selection of a comprehensive system of electric traction which shall be standardised and accepted universally by all railway companies in order to ensure a continuance of the interchange of traffic now so general. The author expresses his firm belief that the increased capacity, economy, and other advantages obtained by conversion, will gradually bring about the systematic electrification of all railways, and insists that a universal system is essential to avoid trouble in the future. After referring to the heavy expense incurred in changing the

Digitized by Google

gauge of many railways to the now uniform one of 4 ft. 8½ in., he enumerates the following requirements for interchange of traffic:—Standard gauge and coupling and uniform brake, heating and signalling apparatus, further uniform contact line pressure and supply frequency, standard trolley-wire construction, and standard multiple-unit control apparatus. The author then describes in detail the characteristics of the three systems, single-phase, direct-current, and three-phase, and is evidently of the opinion that the single-phase system is the most suitable of the three. The choice of frequency is, he says, a most involved, difficult, and important problem. In America, the favourite frequency is 25 cycles, but he mentions that 15 cycles permits of a marked reduction in motor weight, and has been adopted in France, Austria, and elsewhere. Locomotives, he continues, on each of the three systems have proved their reliability, and though there are differences in weight and cost, these are, in many cases, more than offset by the differences in other parts of the system. In his opinion, the controlling factor in the cost of electrification, in nearly all cases, is the transmission and distribution system, and not the rolling stock. The requisites for a universal system are as follows:—The locomotives should practically duplicate the present steam locomotives in speed and power characteristics, but should exceed the latter in capacity; the system should adapt itself to passenger and freight, main, branch, and suburban line services; the contact conductor construction should be simple and reliable, and should interfere as little as possible with the track maintenance. Electric traction will necessitate alterations in practices, such as the composition, speed, frequency and weight of trains, the movement of freight, &c.

In appendices to his paper the author gives particulars of a number of electric locomotives, the more recent of which have already been described in ELECTRICAL ENGINEERING, and also a brief description of the electrical equipment of the New York, New Haven, and Hartford Railway. He states that during the past year the electric service has surpassed in efficiency all records previously obtained on that line with steam locomotives. The line consists of twelve miles with 650-volt D.-C. third-rail equipment, and twenty-one miles with 11,000 volt trolley-wire single-phase equipment. The forty-one locomotives have been in operation for twenty-two months, and the average number of miles run per locomotive per breakdown during the past year exceeds 12,000. Many of the motors have run over 100,000 miles without turning or sandpapering the commutators, and the brushes show an average life of 40,000 miles. The officials of the railway claim that the cost of maintenance per mile is less than with the steam locomotives. The final appendix gives some diagrams illustrating the relative capital costs, running costs, and losses for the three systems in the case of a proposed line, the results being favourable to the single-phase system in all respects.

The five Papers dealing with electric traction were discussed together.

Mr. H. F. PARSHALL (Consulting Engineer to the Central London Railway) pointed out that both the New York Central and New Haven Railroads were handling a class of traffic that could not be handled by steam; but he did not consider that the New Haven Railroad could be compared with our electrical systems since the usual safeguards as to reliable operation had been most studiously eliminated, and the system as it stood would not be possible in Great Britain. With reference to Mr. Westinghouse's Paper, it was erroneous to regard transmission as the principal element to be considered. Owing to the regulations of the Board of Trade in this country, the transmission system as a whole was a great deal more expensive than in the United States, and the cost of the transmission system, including energy losses, and capital charges, was about 15 per cent. of the total as against 45 per cent. chargeable to the electro-motive outfit, and 35 per cent. to the power station charges. He pointed out that the cost of the transmission system, even under the extravagant conditions obtaining in Great Britain (which did not obtain in America), was but one-third of the cost of the electro-motive installation, and that in applying the difference commonly recognised and proved, the difference between single-phase and continuous current motors would more than wipe out the whole 15 per cent. in the transmission system. He further pointed out that if the energy were transmitted single-phase, the cost of copper, with the same power factor, would be one-third more for the A.C. system than for the D.C. system: also that allowing for 10 per cent. additional loss for the rotary converter of the D.C. system, for equal current density, the cost of copper with 0·75 power factor would exceed by 60 per cent. that of the D.C. system, and for equal energy loss would be double that of the D.C. system, always on a basis that the A.C. train outfit was as efficient as the D.C. outfit. Further, owing to the compensating properties of the rotary converter, it would justify its existence considering the economy effected in having unity power factor in the transmission system. In conclusion, he stated that the D.C. system was the only one known in the present state of the art that could compete with steam in the classes of installation to which electricity is generally applicable, that is, to urban, suburban, and dense interborough traffic.

Mr. J. DALZIEL (Midland Railway Co.), who has been jointly responsible for the design and equipment of the single-phase line between Heysham and Morecambe, believed that the electrification of main line railways was comparatively imminent. It was certainly commercial to find a general system to be adopted universally. The single-phase certainly did not possess all the disadvantages which were attributed to it by Mr. Hobart. The general conclusion arrived at at the recent International Railway Conference at Berne was in favour of the single-phase system. Much expense could be saved in avoiding the doubling of main line tracks by the adoption of electricity. Again, it would be possible to burn a cheaper quality of coal in a central power station than on locomotives. The Midland Company's single-phase line had only had four breakdowns in two and a half years, and none of these were due to the use of the single-phase system. Dealing with Mr. Hobart's figures of comparison between the continuous current and single-phase systems, he pointed out that the general conditions assumed in order to get the comparison were not those under which the Morecambe-Heysham line was working.

Mr. STONE referred to the excessive rail wear on lines using the multiple unit system, and remarked upon the fact that on the City and South London Railway, where electric locomotives are used, the wear was not so marked. He thought this pointed to the necessity of having a greater proportion of the driving power on the front motors, and so keep all the draw bars tight instead of as at present with the multiple unit system having them slack, which resulted in a crushing up of the carriages at the moment of starting.

Mr. C. F. SCOTT (Westinghouse Electric & Manufacturing Co., Pittsburg) thought that Americans had devoted more attention to systems rather than the general features of the application of electricity to railway working. The reason for using electric motors was not to save power, but in order to use more power efficiently. He looked to the electrification of railways as a means of saving much expensive widening of tracks. He rather deprecated such comparisons as Mr. Hobart had made, because the slightest error in the assumptions led to very erroneous results, and it rather looked as if there were some errors of this sort in Mr. Hobart's case. A matter which needed some consideration was the cost of power, which, in Mr. Pomeroy's Paper, was given as 60 per cent. of the total cost of working. He disagreed with Mr. Potter's suggestion as to the number of cars necessary for running a service, namely, two in the sheds for every one running. In his opinion, for pure trunk line working the single-phase system was the only one, and it was interesting to note that the only real trunk line being operated in America by electric traction, namely, the New York New Haven line, was now purchasing new locomotives and making extensions upon the single-phase system.

Mr. PHILIP DAWSON sent a telegram regretting his inability to be present, and asserting that all Mr. Hobart's comparisons had been founded on erroneous data, which vitiated all his conclusions.

Mr. H. M. HOBART, referring to Mr. Potter's Paper, agreed that perhaps for the 100-mile line mentioned, single-phase might beat continuous current, but it was in those cases where single-phase was cheaper than continuous, that steam would beat them both.

Mr. ANGUS SINCLAIR (United States) did not think that there was much possibility of electricity beating steam for goods traffic in the United States for a long time to come.

Mr. J. G. WILSON (Great Eastern Railway), did not think it would be wise at present to standardise a system of electric railway working. It seemed to him that on railways having a heavy suburban traffic, such as the Great Eastern, the direct-current system would be cheapest, whilst on a line such as the Great Northern, with a heavy mineral traffic, the single-phase system would be the best. In view of the immediate advantages of the electrification to individual lines he did not think it wise to postpone general electrification for the sake of the problematical advantages of a standard system in the future, which would enable interchange of traffic to take place.

Prof. HUTTON (Honorary Secretary, American Society of Mechanical Engineers) thought the conditions of railway working in cities needed consideration before the long lines running into the country. He thought it would be a long time before the latter would need to be converted to electric traction.

Mr. J. A. F. ASPINALL (General Manager of the Lancashire and Yorkshire Railway) said that his experience was that heavy electric locomotives with large bearing surfaces and large journals based upon steam locomotive practice, were becoming necessary. At present the centre of gravity was very low, and the weight was not spring borne; hence the wear and tear on the rails was excessive. No general manager could afford to close his eyes to the possibilities of all systems of electric traction in order to utilise the rolling stock to the greatest extent. The feature of railway working at present was the extraordinarily small amount of time that the locomotives were doing useful work. Figures had been got out to show that for only 28 per cent. of their time were locomotives in commercial use.

WEST HAM ELECTRICITY UNDERTAKING

Overdrafts Declared Illegal

MR. JUSTICE NEVILLE delivered judgment on Friday in the action taken by certain ratepayers in West Ham, principally the India Rubber, Gutta Percha, and Telegraph Works Co., Ltd., of Silvertown, against the Corporation in regard to the financial management of their electricity undertaking. The general charge against the Corporation was that monies have been borrowed in the form of overdrafts from the London County & Westminster Bank in respect of the electricity undertaking for which the sanction of the Local Government Board had not been obtained, and that consequently the interest paid to the Bank, amounting to £14,000, was illegal, and must be repaid. A further charge was made that deficits upon the electricity undertaking have been carried forward from year to year instead of being met out of the current rate as provided for by the Acts of Parliament relating to municipal government, and also that proper provision has not been made for sinking fund in repayment of previous loans. The hearing of the action was reported at length in our issues of July 14th and 21st.

The judgment, which was against the Corporation on all points, took the form of a number of declarations as follows: (1) the overdraft obtained from the Bank for general purposes in respect of borrowing powers granted for specific purposes was *ultra vires* and illegal; (2) the application of money due to the Consolidated Loans Fund in repayment of such an overdraft was *ultra vires* and illegal; (3) the borrowing of money from the Bank for the purposes of electricity account otherwise than in the exercise of borrowing powers with the sanction of the Local Government Board was *ultra vires* and illegal. The Corporation and the Borough Treasurer were ordered to pay the costs of the action. During the action the case against the London County & Westminster Bank in respect of the interest, the return of which was claimed, was settled on the Bank agreeing to pay back the sum of £7,000.

It will be noticed that an injunction has not been granted, and in a short discussion at the conclusion of the judgment Mr. Justice Neville stated that he did not know of any means by which a declaration can be enforced.

MUNICIPAL WIRING

THE Leicester Corporation have decided not to appeal against the recent judgment of Mr. Justice Neville to the effect that municipalities may not wire premises or supply fittings except under special Parliamentary powers.

We understand that the Electrical Contractors' Association have made a proposal to the Sheffield Corporation for ending the dispute between them as to the wiring of premises, &c., which has been going on since 1898. The Sheffield Corporation in 1898 acquired the undertaking of the Sheffield Electric Light & Power Co., and £6,000 of the purchase money was paid specifically in respect of the house-wiring department. When the undertaking was taken over by the Corporation, the local contractors objected to this department being continued, but the Corporation resisted their demands, and they have continued the wiring of premises, &c., ever since. In the meantime the Electrical Contractors' Association have threatened to apply for an injunction to restrain the Corporation. Since the decision in the recent Leicester case, which is not to be appealed against, the Electrical Contractors' Association have suggested to the Sheffield Corporation that their dispute should be ended by the Corporation agreeing to an injunction against themselves, but no decision has yet been come to by the Corporation.

The question of municipal wiring was discussed at the Glasgow Convention of the Incorporated Municipal Electrical Association this year, and the Council were instructed to proceed in the matter of promoting a Bill in the next session of Parliament for conferring wiring powers upon all municipalities (ELECTRICAL ENGINEERING, June 23rd, p. 420). Acting upon this, a letter has been sent round to all municipalities in order to see to what extent such a Bill would be supported, and a number of Corporations have discussed the matter and come to a decision. The Dundee Corporation have agreed to support the Bill (ELECTRICAL ENGINEERING, July 21st, p. 483); at Oldham no action is being taken, as the Council are opposed to this form of municipal trading (ELECTRICAL ENGINEERING, July 28th p. 499); at Belfast the Electrical Engineer is to report upon the proposal; a motion to financially support the promotion of a Bill has been rejected at Stoke-on-Trent; the West Ham Electricity Committee propose to support the Bill; and the Middlesbrough Corporation, whilst agreeing with the need for such a Bill, will not financially support it.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

WELDING APPARATUS.—A leaflet from James McMillan & Co. (Clun House, Surrey Street, Strand, London), gives prices and particulars of apparatus for autogenous welding with acetylene or lighting-gas and oxygen.

FANS.—Messrs. Matthews & Yates, Ltd. (Swinton, Manchester), have sent us a leaflet calling attention to their "Cyclone" fans, blowers, and exhausters. The firm have recently introduced a motor especially designed for fan work, and constructed in sizes ranging from 3/16 b.h.p. to 5 b.h.p.

ELECTROMEDICAL APPARATUS.—Four new leaflets are to hand from Messrs. Siemens Bros. & Co. These describe respectively the "Skiafix," an apparatus for holding parts of the body during X-ray exposures; an improved pattern of X-ray outfit, with rotating high-tension rectifier; a small motor-generator set mounted on a portable table for providing current for cautery and other electrical treatments; and a new series of tantalum dental instruments. The special feature of the small motor-generator set is that it is so designed and constructed that it is impossible to obtain a shock from any of the regulating devices, or from the low-voltage cautery circuit. A flexible shaft is provided for vibration-massage and surgical operations.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

REFLECTORS.—A leaflet is to hand from the Reflector Syndicate, Ltd. (82 Victoria Street, Westminster), describing the Cowper-Coles patent gold mirrors, which are manufactured by depositing a film of gold on a glass surface. Motor-car headlights, searchlights, reflectors for general lighting, advertisement signs, and other adaptations are referred to.

INSULATORS.—We have received a comprehensive list of porcelain insulators, containing illustrations of a large number of patterns, both for overhead lines and interior wiring, insulating tubes, ceiling roses, fuse bases, &c., from the Paul Rauschert Porcelain Works of Huettengrund-Huettensteinach, Thuringia, Germany.

PUMPS.—Two illustrated lists are to hand from Messrs. Frank Pearn & Co., Ltd. (Manchester), giving dimensions and other particulars of a variety of steam and electrically driven pumps. Another leaflet from the same firm describes the Pearn patent high-speed surfacing and milling machines. These lists are issued in accordance with the system of the Engineers' Standardised Publications Association, and an index card printed with the name of the firm and the articles listed is supplied with the leaflets.

SWITCH-FUSE BOXES.—Messrs. A. Reyrolle & Co. Ltd. (Helburn-on-Tyne), have issued a revised list of their switch-type fuse boxes, which are now manufactured with capacities up to 400 amperes. The fuse-holders are attached to the lid, and, in order to replace a fuse, the holders must be withdrawn from all contact with the circuit.

Birmingham Tramways Dispute.—The action of certain shareholders against the City of Birmingham Tramways Co., who object to a proposal passed at an extraordinary general meeting to repay £4 per share on certain £5 shares in order to leave all the paid up shares as £1 shares, has been settled. In the Chancery Division the decision of the company was approved, and notice of appeal was given by the shareholders in question. When the case came on in the Appeal Court last week, however, it was stated that a settlement had been arrived at.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published July 28th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

18,965/09. **Arc Lamp Carbons.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). When carbons contain titanium carbide, particles of the substance are thrown off from the arc and adhere to the glass globe, and cannot be cleaned off. To prevent this, four and a half per cent. of free sulphur is mixed with the titanium carbide. The sulphur fuses with the carbide to form a compound which does not stick to glass. Four claims.

19,045/09. **Wall Socket.** J. M. Connare. The interior of this socket is similar in construction to an ordinary bayonet lamp-holder, the plug being in the form of an adapter. The flange has slots to allow the pins of the adapter to pass, and a disc cover is loosely rivetted at one side so that it will fall over the socket when the plug is withdrawn. Two claims, three figures.

19,871/09. **Electrical Marine Propulsion.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). It has been proposed to reverse by changing the connections between polyphase motor and generator, but the machines will get out of phase during the change over, and on closing the circuit a heavy current will flow unless resistances are used, which is undesirable. According to this invention, the motor and generator are permanently connected, and reversal is obtained by reversing the turbine, which is provided with forward running and reversing elements. If a forward running exhaust steam turbine is fitted on the propeller shaft, the supply of steam must be cut off before reversing, all the work being done by the reversing element of the main turbine. Four claims, three figures.

7,860/10. **Heating Apparatus.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). A number of wire heating spirals are stretched between two terminal blocks, and are connected in parallel. To strengthen the combination, several transverse stiff metal strips are connected to the spirals at points of equal potential. Three claims, three figures.

10,607/10. **Driving of Rolling Mills.** Allgemeine Elektricitäts Ges. In the Ward-Leonard system, a main lever is provided for effecting control of the speed of the driving motor from zero to rated full speed by varying the applied voltage, and in order to increase further the speed during the last stages of a pass, the field of the motor is weakened by means of an auxiliary lever. The two levers are usually interlocked to prevent the field being reduced until the maximum pressure is applied, but in spite of this the second is often operated too soon. To prevent this, the release of the second lever is made dependent upon the speed or back E.M.F. of the motor having reached a predetermined value. Two claims, two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Proctor, 16,924/09; Gebrüd. Siemens & Co. [Protective coating for carbons] 12,425/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Insulating compounds] 23,225/09.

Dynamos, Motors, and Transformers: Livesay [Generating systems] 20,587/09.

Electric Ignition: G. Roth A.G. [Combined electric and percussion primer for cartridges] 4,449/10.

Electrometallurgy and Electrochemistry: Flood [Electrolytic cell] 15,960/09; Corby [Electro-deposition] 2,002/10; Crocker [Electrolytic cells] 2,032/10.

Heating and Cooking: Ross [Heaters] 16,547/09.

Incandescent Lamps: Salzer [Supports for metal filaments] 6,658/10.

Storage Batteries: Marseille and Gouin [Alkaline cell plates] 3,733/10.

Switchgear, Fuses, and Fittings: Berry and Markham [Iron-clad switch-fuse] 13,443/09; Leitner [Automatic battery-charging switch] 15,888/09; A.-G. Brown, Boveri et Cie. [Regulation of installations] 16,630/09; Walker [Switches] 20,786/09; Podszns [Vapour apparatus] 22,827/09; Leitner [Reversing switch for generators] 23,042/09; Murray [Cut-outs] 23,227-8-9/09; Carrigan [Switches] 24,109/09; Down [Lamp-bracket for hospital operation theatres] 439/10; White and Carichoff [Electrically-operated switchgear] 4,697/10; Partington [Multiple fuse] 10,961/10; Lange [Portable lamp] 13,828/10.

Telephony and Telegraphy: Edwards (*Rosen*) [Telegraph transmitting machines] 18,954/09; Siemens & Halske A.-G. [Telephone exchanges] 26,269/09; Siemens Bros. & Co., and Riber [Telephone apparatus] 467/10; Fessenden [Wireless telegraphy] 10,817/10 and 11,155/10; Howard and Coad [Telephone mouthpiece] 11,333/10.

Traction: McCollum [Signalling] 16,541/09; Jackson [Trolley head] 16,682/09; Cunliffe and Alderman [Signalling] 19,399/09; Jones and Nelson [Actuating tramway points] 20,780/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Signalling systems] 24,017/09.

Miscellaneous: Viry [Controlling movements from a distance] 18,624/09; Dickie [Temperature alarm] 24,997/09; Elektriska Aktiebolaget, A.E.G. [Submarine mines] 1,206/10; Soc. Magic. Publicity [Luminous signs] 1,547/10; Stachow [Magnetic ore separators] 3,314/10; Lux [Electrical control of valves] 3,697/10; Kukiolka [Fire-alarm] 9,644/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electrometallurgy, &c.: Herold [Primary batteries] 13,739/10; Hering [Furnaces] 15,139/10; Badische Anilin & Soda Fabrik [Manufacture of nitrides] 16,368/10.

Incandescent Lamps: Krause [Elastic supports for metal filaments] 349/10.

Switchgear, &c.: Schafer [Mercury-vapour rectifiers] 15,720/10.

Telephony, &c.: Rosenthal [Transmitter for submarine telegraphy or telephony] 15,837/10; Cerebotani and Silbermann [Printing telegraph] 16,253/10.

The following amended Specifications can now be obtained.

W. Roos [Magneto-generator] 12,135/07; R. Hopfelt [Manufacture of metal filaments] 8,146/09.

Opposition to Grant of Patents

6,177/09. **Electrical Marine Propulsion.** C. A. Parsons, G. C. Stoney and A. H. Law. This patent has been granted in spite of the opposition by Mr. W. P. Durtnall. (See Electrical Engineering, July 21st, p. 476, and July 28th, p. 491.)

15,151/09. **Controllers.** R. C. Lyness. Opposition has been entered to the grant of this patent, which covers a contact finger for controllers. The finger is sprung into a bracket on the contact base, and is provided with a renewable tip sprung on to the finger.

Application for Amendment

9,802/98. **Electric Driving of Printing Presses.** W. A. Clatworthy, and J. H. Holmes & Co. desire to amend this patent in respect of which they recently brought, and lost, an action for infringement against the Associated Newspapers, Ltd. (Electrical Engineering, (Vol. V., pp. 915,936). An appeal (Electrical Engineering, February 3rd, 1910, p. 74) was dismissed. The Appeal Court decided that claims 1 and 2 were too wide to be valid, and the patentees desire to substitute the following: "Apparatus for electrically driving a newspaper printing machine or the like at very diverse speeds, consisting of a main motor coupled or geared direct to the main shaft of a driven machine in combination with an auxiliary high-speed motor, a power gear arranged between the main motor and auxiliary motor, a self-releasing clutch arranged between the power gear and main motor shaft, and a combination switch for controlling both motors, all arranged so that by the operation of the combination switch the auxiliary motor must be used both for the purpose of driving the printing machine at a slow and steady rate when required and for starting the printing machine from rest to enable the main motor to gather up power and drive without shock or excessive current, substantially as described."

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

17,481 of August 7th, 1896. **Steam Turbines.** J. Schmidt. This patent covers rotor discs provided with radial slots at the outer periphery to receive the blade shanks. The inner end of each slot is enlarged to receive a corresponding enlarged portion of the blade shank.

The following are the more important Patents that have become void through non-payment of renewal fees.

Electrometallurgy, &c.: H. Newton (*Farbenfabriken vorm. F. Bayer & Co.*) [Electrolytic manufacture of dyes] 7,708/99.

Storage Batteries: H. Leitner [Plates] 7,720/05; W. Fennell and W. P. Perry [Plates] 7,903/05.

Switchgear, &c.: J. Y. Johnson (*Voigt & Haeffner A.-G.*) [Automatic synchronising apparatus] 7,591/05.

Telephony, &c.: P. M. Justice (*Rowland Telegraphic Co., U.S.A.*) [Printing telegraphs] 8,487/02; W. Hjorth [Push-button telephone switch] 8,491/03.

Traction: F. H. Higley [Single-line signalling system] 8,421/04.

Miscellaneous: C. Junge (*W. Pierce*) [Boiler-tube scraper] 9,379/97.

Digitized by Google

STREET LIGHTING IN THE CITY OF LONDON

A REPORT on the work during 1909 of the Public Health Department of the Corporation of London, published last week, contains some information with regard to street lighting in the City. The number of arc lamps in use was not increased, or decreased, during the year. At the end of the year there were 366 of the original open-type arc lamps in use, at a total cost of £26 per annum per lamp, 32 of these lamps in Old Bailey, Ludgate Circus, and St. Paul's Churchyard having been replaced by cheaper flame arc lamps. In addition to these there were 63 Oliver flame arc lamps, costing £17 10s. per annum per lamp, and 18 Reason enclosed arc lamps, costing £12 10s. per annum per lamp, in use. Of the 63 Oliver lamps, 21 have been installed experimentally in Holborn by the City of London Electric Lighting Co., who are also responsible for the Reason lamps, also erected experimentally in Farringdon Street. The Charing Cross Co. continued their experimental lighting of Cannon Street with ten Oliver flame lamps, centrally hung. The number of defective lamps reported during the year was 52.

The number of gas lamps, including experimental lamps, paid for by the Corporation at the end of the year was 2,720, being a decrease of ten during the year. The 17 high-pressure inverted Keith lamps, installed in Fleet Street in December, 1908, were maintained during the year, the annual charge per lamp now being £15 2s. 6d. The number of defective gas lamps reported during the year was 1,841, viz., 1,495 ordinary, and 346 high-pressure lamps.

Finally, some extracts from the report of the deputation of the Streets Committee which visited several continental towns in March, 1909, are given. This report was abstracted and commented upon in ELECTRICAL ENGINEERING, Vol. V., July 15, 1909, p. 645.

LOCAL NOTES

ABERDEEN: *Industrial Advantages.*—A well got-up pamphlet has been issued by the Industrial Development Committee of the Corporation dealing with the Industrial and other societies of the City of Aberdeen. Particulars are given of the electric supply service, together with the charges for lighting and power, and an interesting list is included of the various industries at present carried on in the City and neighbourhood.

Tramways Accounts.—The accounts of the Corporation tramways for last year show a decrease in revenue of £558. The cost of electrical energy, however, has decreased by £1,124, but there was a deficit on the year's working of about £80. As, however, the introduction of universal 1d. fares represents a concession to the public of £2,554, the result of the year's working may be considered very satisfactory.

ARGENTINE: *Telephones in Rosario.*—According to the *Review of the River Plate*, the Rosario Municipality, in endeavouring to secure improvements in the service of the United River Plate Telephone Co., propose to put the company upon a new basis in regard to its concession. The Council claim that the company at present has only a permit which was granted in 1886, and it is now proposed to make the company pay the Corporation 5 per cent. of its gross receipts. If the company refuses to accept this offer, it is proposed to annul the permit and call for tenders for a telephone service in Rosario. Our contemporary adds:—"We are inclined to believe that the intention to tax the company has been uppermost in the minds of the authorities more than improving the service."

AUSTRALIA: *Sydney: Electricity Accounts.*—The report of the City Electrical Engineer for 1909 states that the number of units sold was 11,914,720, against 8,673,942 in the previous year. The large increase in output is partly due to the large number of consumers taken over from the purchased companies. The horse-power of motors connected increased from 8,290 to 10,978. The demand for motors on hire continues to increase, whilst the increase in the number of arc lamps on hire was greater than the increase in the previous year by 18 per cent. The rapid increase in this branch, however, is not looked forward to, as metal filament lamps are displacing arc lamps in many places. The total revenue was £118,275, and the working expenses, after adding 4 per cent. for depreciation, was £72,249.

BELFAST: *Electric Wiring.*—A letter from the Incorporated Municipal Electrical Association regarding the proposal made at the annual convention at Glasgow in June, that a Bill should be promoted in Parliament conferring electric wiring powers upon all municipalities, has been referred to the Electrical Engineer for his observations.

BRADFORD: *Plant Extensions.*—The two 3,000-kw. Curtis turbines which have been erected in the Valley Road power station were put into operation on Thursday. All the work has been carried out under the superintendence of Mr. T. Roles, City Engineer, the chief contractors being the British Thomson-Houston Co., Ltd., Worthington Pump Co., Ltd., Messrs. Pearn & Co., Messrs. Aiton & Co., and Messrs. Babcock & Wilcox, Ltd.

BRISTOL: *Electricity Deficit.*—The presentation at the last meeting of the Council of the accounts of the electricity undertaking for last year, which show a loss of £2,029, gave rise to considerable discussion and criticism. The whole of the loss is attributed to the use of metal filament lamps, for the number of consumers has increased, together with the output. Alderman Pearson, Chairman of the Electricity Committee, replying to his critics, gave many instances in which bills for electric light have been halved by the use of metal filament lamps. If the committee had seen fit to add a small fraction of a penny to the price per unit they could have put this right, but he did not think this was the proper policy to adopt.

CANADA: *Montreal: Street Lighting.*—A dispute has been in progress between the Council and the Montreal Light, Heat & Power Co. for some time concerning payment in respect of street lighting. It has now been decided to appoint Professor Herdt (of McGill University), Mr. A. Black (a civil engineer of Toronto), and Mr. A. Dion (Chief Engineer of the Ottawa Electric Railway Co.) as a Committee to arbitrate upon the matter.

CARDIFF: *Electric Lighting Accounts.*—There was a net profit of £1,124 upon the electricity accounts for last year. The revenue increased by £1,219.

Tramway Accounts.—After meeting capital charges, the tramway accounts for the past year show a net profit of £11,032, of which £6,937 has been transferred to depreciation and £4,094 to reserve. The number of passengers carried, namely, about 26,000,000, was a reduction of 24,000 from the total of the previous year, and the results show an increase in income with less mileage and fewer cars.

CROYDON: *Home Office Regulations.*—The Electrical Engineer reports that the new Home Office regulations will necessitate an estimated expenditure at the power station of £1,176.

DERBY: *Tramways Accounts.*—The net profit for the year to March 31st was £3,626, against £3,734 in the previous year.

FROME: *Transfer of Electricity Undertaking.*—Subject to the consent of the Board of Trade the Council's electricity undertaking is to be transferred to Messrs. Edmundsons' Electricity Corporation, who originally erected the works, and who have been carrying them on for the Council. The Council are to pay to the company the outstanding balance of £8,278 on capital account now due to them. The Council also agree to take current for street lighting purposes until 1928. Provision is made for the undertaking to be taken over again by the Council if thought desirable on arbitration terms, but the price is not to exceed £70,000.

LAUNCESTON (Cornwall): *Electric Lighting.*—The Board of Trade have written threatening to revoke the Electric Lighting Order granted in 1903, and now in the hands of the Electric Supply Corporation. The Council are in communication with the company on the matter.

LEITH: *Tramway Accounts.*—There was a loss of £1,625 upon the tramways undertaking last year, compared with £3,857 in the previous year.

LIMERICK: *Management of Electrical Undertaking.*—Mr. Aubrey V. Clayton, of London, has been appointed by the Council to investigate the general position and management of the electrical undertaking.

LLANELLY: *Electric Supply.*—Work has been commenced upon the buildings for the new power station of the Llanelly & District Electric Lighting Traction Co.

LONDON: *Hammersmith: Olympia Exhibition.*—The New Olympia Co. applied for permission to generate their own current at an electrical exhibition, to be held in September, 1911. At the present time the Company are under an agreement with the Council to take all current required for lighting and power from the Council's works, in consideration of which current is supplied at a low charge. The permission asked is only required in order to demonstrate the practicability of isolated country house generating plants. In 1906, for a similar exhibition, the company was allowed to generate continuous current, on which they paid the Council a royalty of ½d. per unit. In the present instance a royalty of ¼d. per unit is to be charged.

St. Pancras: Electricity Accounts.—The accounts of the electricity undertaking for the year ended March 31st show an increase in revenue of £1,613 over last year. The net profit is £9,506, as compared with £7,126 in the previous year. The Electricity Committee have adjourned to their next meeting the consideration of the disposal of the balance.

Digitized by Google

MARKET HARBOROUGH: *Electric Lighting Order Revoked.*—The Board of Trade have revoked the Market Harborough Electric Lighting Order granted in 1906.

PAIGNTON: *Tramways.*—The Council have been in communication with the National Electric Construction Co. with regard to the construction of the tramway on the overhead system between Torquay and Paignton. As they seem to be unable to get any satisfactory reply from the company, application has been made for the deposit of certain sums of money as provided for in the Act of Parliament authorising the extension.

PLYMOUTH: *Motors on Hire.*—The Electrical Engineer was recently instructed to report as to the desirability of making arrangements for letting motors on hire. He has now informed his committee that no scheme can be drawn up, because the Corporation have not the necessary Parliamentary powers.

SOUTHGATE: *Electricity Supply.*—The agreement between the Council and the North Metropolitan Electric Power Co. has been sealed.

TASMANIA: *Launceston: Electrical Extensions.*—Mr. R. J. Strike, the City Electrical Engineer, has presented comparative estimates of the cost of extending the power station by means of a Diesel engine and steam plant. It is proposed to install a three-phase alternator working in parallel with existing alternators driven by hydraulic turbines, and Mr. Strike has only been able to discover one instance where the Diesel engine is working under these conditions, namely, at St. Moritz, in Switzerland. Taking a Diesel engine capable of driving a 400 E.H.P. three-phase alternator, and the necessary enlargement of power station, &c., the capital cost is put at £10,851 15s., and the cost of oil at £5 per ton. For generating 875 units per day for 30 days during the summer, when the supply of water for the water-power plant diminishes, the costs are put at £620. The capital cost of steam plant is put at £6,059, and the working expenses at £450 14s. Consequently Mr. Strike is in favour of installing steam plant with coal firing rather than oil engines or steam engines with oil fuel.

WATFORD: *Trolley Omnibus.*—The Middlesex County Council propose to promote a Bill next session for powers to adopt the trackless trolley system for the Watford district.

WEST BROMWICH: *Supply in Bulk.*—An offer of the Shropshire, Worcestershire, & Staffordshire Electric Power Co. to supply electricity in bulk has been declined after careful consideration by the Electricity Committee.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-stations, Mains, &c.

ACCRINGTON.—A new storage battery is to be installed at the electricity works.

AUSTRIA-HUNGARY.—H.M. Consul of Buda-Pesth reports that the negotiations for the acquisition by the Council of the two electric supply companies in Buda-Pesth have failed, and the municipality are proposing to erect a separate power station.

BARKING.—Tenders are to be invited for the supply of cable.

BRAZIL.—The *Financial Times* states that the Brazilian Electric Power Co. has been granted a concession for the supply of electric power in Rio Janeiro in competition with the Rio Janeiro Tramway, Light & Power Co. As a result of this concession, the latter company have obtained an injunction in the High Court in the Brazilian Republic restraining any interference with their rights.

HESTON AND ISLEWORTH.—An inquiry was held last week concerning a loan of £3,600 for electrical extensions.

LEICESTER.—A Local Government Board inquiry was held last week concerning a loan of £19,190 for electrical extensions.

NETHERLANDS.—The Amsterdam Municipality propose to enlarge their generating station.

The Municipality of Deventer has decided to establish an electric power station.

SOUTHAMPTON.—In connection with the proposed duplication of the high-tension feeder to the Portswood district a small sub-station is to be erected in the Portswood tramway depôt.

SOUTHEND.—An inquiry was held last week concerning a loan of £20,467 for electrical extensions. This sum includes £3,000 for meters, and £1,000 for street lighting purposes, but the Inspector recommended that these should be paid for out of revenue.

STOKE-ON-TRENT.—A committee has been formed to consider the question of extensions.

TURKEY.—The Belgian Vice-Consul at Tripoli states that the municipal authorities are considering the erection of an electric generating station for lighting and tramways.

WEST HAM.—A Local Government Board inquiry has been held into an application by the Corporation for a loan of £52,000 for electrical extensions. The India Rubber, Gutta Percha & Telegraph Works Co. were represented, and somewhat heated discussion again took place between Mr. Elvy Robb, the solicitor for them, and the officials of the Corporation upon details of contracts entered into, but, as on the previous occasion, the Corporation refused to give any information on these points. The loan asked for includes £20,600 for prospective extensions of mains, and £5,000 for services; a new substation is being erected; more motors are required for hiring out; £19,400 are required at the generating station, and £2,000 for a crane and elevator. As a result of the answers given, the Inspector mentioned that he would take the advice of the Local Government Board as to whether the inquiry should be adjourned in order that the questions raised by the Silvertown Co. should be further investigated.

WREXHAM.—An application is to be made for a loan of £3,345 for electrical extensions.

Miscellaneous

ABERDEEN.—The car shed accommodation is to be increased at an estimated cost of £1,625.

LONDON: *London County Council.*—Tenders are invited for covering with asbestos tape certain electric cables (see an advertisement on another page).

St. Pancras.—Two additional feeder pillars are to be obtained, at an estimated cost of £221.

NEW ZEALAND.—Tenders are invited by the Minister of Telegraphs, Wellington, by December 15th, for the erection of wireless telegraph stations at (1) Doubtless Bay, (2) Gisborne, (3) Capt Farewell, (4) Sumner, near Christchurch, (5) and Bluff. Copies of the specifications, &c., may be obtained on application to the Office of the High Commissioner for New Zealand, 13 Victoria Street, London.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

W.C.—Alterations and extension of Italian Hospital, Devonshire Street, Queen Square. E. & A. Roome & Co., builders, 36 Basinghall Street, E.C.

S.W.—Extension of South-Western Polytechnic, Chelsea, S.W. The Governors.

Adaptation part of Fitzalan House, Arundel Street, W.C., for accommodation of L.C.C. Staff. Architect, L.C.C., Spring Gardens, S.W.

Adaptation of part of Hamilton House, Temple Avenue, and 35 Spring Gardens, for accommodation of L.C.C. Staff. Architect, L.C.C., Spring Gardens, S.W.

E.—Schools, Tollit Street, Mile End. Architect, L.C.C. Education Committee, Victoria Embankment, E.C.

E.C.—Bank premises, Threadneedle Street, H. A. Pelly, architect, 25 Gresham House, Old Broad Street, E.C.

N.—Public slaughterhouses, Metropolitan Cattle Market, Islington, N. (£19,050). F. Sumner, engineer and surveyor, City of London Corporation, Guildhall, E.C.

PROVINCES.

BARROW.—Proposed fire station (£2,380). J. W. Smith, Borough Surveyor.

BRADFORD.—School, Thornbury (£6,000). R. S. Kirkby, City Architect.

BRIDGWATER.—Police station and court-house, Northgate (£7,778). F. Parr, Surveyor, Bridgwater Town Council.

BRIDLINGTON.—Proposed isolation hospital. J. Haggett, Borough Surveyor.

CANTERBURY.—The workhouse is to be wired for electric lighting. The City Electrical Engineer is preparing a scheme.

CROYDON.—Electric theatre and offices, North End. Architects, Gilbert & Constandures, 43 Finsbury Square, E.C.

DEWSBURY.—Central disinfecting station. Surveyor, T.C., Dewsbury.

DOVER.—School (£4,400). Secretary, Education Committee.

DUBLIN.—The Technical Education Committee invite tenders for the wiring of the Bolton Street Technical Schools. Particulars from the City Electrical Engineer, and tenders by August 9th.

ECCLES.—Extension school and Patricroft hospital. J. Knight, architect, South King Street, Manchester.

FALKIRK.—Extension fever hospital (£1,500). Surveyor, Eastern District of Stirlingshire C.C.

FOOTSCRAY.—Enlargement of Longlands Council School (£1,570). Builders, Friday & Ling, Northend Works, Erith.

GRIMSBY.—Council school, Strand Street (£8,796). Architect, H. C. Scaping, Court Chambers.

MALVERN.—Parish hall (£2,000). Churchwardens of Holy Trinity Church, Malvern.

MANCHESTER.—Theatre (1,000 places). Managing Director, Victoria Picture Theatres, Ltd., Manchester.

Digitized by Google

MANSFIELD.—Electric theatre, Leeming Street, for the Palace Electric Theatre Co.

MIDDLESBROUGH.—Archibald Schools, Ayresome Green Lane (£14,150). Clarke & Moscrop, architects, Middlesbrough.

NEWCASTLE-ON-TYNE.—Alterations to school, Westmoreland Road (£1,434). J. C. Hope, builder, 7 Meldon Street, Newcastle.

PAISLEY.—School (£9,500). Craig, Barr & Cook, architects, 15 St. James's Place, Paisley.

PONTYPRIDD.—Additions, Hopkinstown Schools (£2,500). W. C. Lowe, architect, Pontypridd.

SALISBURY.—Joint isolation hospital (14,187). Thos. Higgs, builder, Northampton.

SUNDERLAND.—Building at workhouse (£4,000) for consumptives. R. Thompson, Clerk, Guardians.

WEST HAM.—Cinematograph theatre, High Street, Stratford. Emden, Egan & Co., Architects, 2 Lancaster Place, E.C.

WEST HARTLEPOOL.—Completion of St. Aidan's Church (£3,000). J. H. Marsion & Son, architects, Bank Chambers.

TENDERS RECEIVED AND ACCEPTED

BRIDLINGTON.—A tender has been placed with the British Westinghouse Co. for the supply of metal filament lamps for twelve months.

CHELMSFORD.—Tenders have been received from the Electric Supply Corporation and the Chelmsford Gas, Light & Coke Co. for street lighting for three or five years, but they have been referred to a committee for a report. The Electric Supply Corporation's price for flame arc lamps is £25 5s. per annum, and for 100-c.p. metal filament lamps, £3 3s. per lamp per annum. The tender offers a higher candle-power at the same rate as is now being paid, the previous metal filament lamps being only 32 c.p.

EALING.—The Council have accepted the tender of Willans & Robinson at £2,332 for condensing plant.

HENDON.—The Council have accepted the tender of Messrs. Waring and Gillow for the electric wiring of the whole of the Council's offices, which are now lighted by gas.

LEYTON.—The Council have accepted the tender of Headland & Headland at £9 10s. for a supply of 32-c.p. tantalum lamps. An order has been placed for a further 25 public lighting lanterns with the Electrical Joint Box Co.

LONDON: *St. Pancras.*—The Council received the following tenders for 21 flame arc lamps: Electrical Co. (incomplete), £86 13s. 6d.; Foster Arc Lamp Co., £116 7s. 6d.; Abbey Electric Co., Ltd. (incomplete), £165; Arc Lamps, £183 8s.; Gilbert Arc Lamp Co., £184; Beck Flame Lamp Co., £189; Maxim Lamp Works. £210; Johnson & Phillips, £213; Union Electric Co. (accepted) (Excello), £216 11s.; Crompton & Co., Ltd., £222; Oliver & Co., Ltd., £250; General Electric Co., £300; British Westinghouse Co., £308; Jandus Arc Lamp Co., £315 9s. 6d. The Chief Electrical Engineer states that he found the Excello, Crompton, and Johnson & Phillips lamps the most suitable for the Council's purposes, and of these three he recommended the Excello lamp offered by the Union Electric Co., as the patent methods applied for carrying away the products of combustion and keeping the globe clean had proved most advantageous.

The tender of Messrs. Edwin Danks & Co. (Oldbury), Ltd., for an additional boiler at £2,600 has been accepted.

SOUTHAMPTON.—The Council have accepted the tender of Messrs. Willans & Robinson at £392 for an air pump for the 300-kw. alternator.

WEST HAM.—The Council have placed an order with the British Thomson-Houston Co., at £83 for a Tirrill regulator; they have also accepted the tender of the British Westinghouse Co. for switchgear at £573.

Messrs. Willans & Robinson, Ltd., have recently received a large number of orders for surface condensing plants, the principal of which are set out below:—One set for dealing with 100,000 lbs. steam per hour for the East Rand Mines; two 64,000 lbs. sets for Sydney Corporation; two 41,000 lbs. sets for Australia; one 36,000 lbs. set for Cardiff Corporation; three 34,000 lbs. sets for Canada; one 30,000 lbs. set for Eastbourne Corporation; one 30,000 lbs. set for South Africa; one 28,000 lbs. set for Belfast Corporation; two 22,000 lbs. sets for Devonport Dockyard; two 21,000 lbs. sets for Midland Railway, Derby; two 20,000 lbs. sets for Pleasley Colliery; two 17,000 lbs. sets for Baldwins, S. Wales; two 15,000 lbs. sets for Calcutta Electric Supply Co.; one 13,000 lbs. set for Carlisle Corporation; two 7,500 lbs. sets for Swansea Harbour Trust.

APPOINTMENTS AND PERSONAL NOTES

In consequence of the appointment of Mr. C. H. Yeaman as Electrical Engineer to the new County Borough of Stoke-upon-Trent, the electrical engineers at Burslem, Longton, and Stoke have been given three months' notice to terminate their agreements.

Mr. George Westinghouse has resigned the presidency of the Westinghouse Electric & Manufacturing Co., Pittsburg. Mr. E. F. Atkins succeeds Mr. Westinghouse.

Mr. George G. L. Preece, for 15 years with Messrs. W. T. Glover & Co., Ltd., Electric Cable Manufacturers, Trafford Park, Manchester, and for the last few years acting as their technical and special outside cable expert, has now joined the firm of Messrs. Bruce Peebles & Co., Ltd., of Edinburgh.

Taunton Corporation invite applications for the post of Borough Electrical Engineer. The commencing salary is £200 per annum. Applications to the Town Clerk by August 4th.

Mr. Jas. R. Wilkinson, B.Sc., son of Mr. Geo. Wilkinson, Borough Electrical Engineer, Harrogate, has just passed out of University College, London, with distinction. During the College course Mr. Wilkinson was a member of the Officers' Training Corps; he is to be gazetted within the next few days, after which he joins his regiment at Salisbury Plain for four months' military training. He will then take a three years' course of practical engineering in Woolwich Arsenal.

The Right Hon. James Tomkinson, Chairman of the North Wales Power & Traction Co., Ltd., who died in April last, left estate of the gross value of £115,156, with net personality £75,059.

Mr. W. R. Dick, a director of the Craigpark Electric Cable Co., Ltd., who died early this year, left estate of the gross value of £40,000 with net personality in the United Kingdom valued at £35,493.

The late Major Philip Cardew, who was at one time Electrical Adviser to the Board of Trade, left estate of the gross value of £30,330, and net personality of £10,925.

The late Mr. Alfred Colson, Electrical and Gas Engineer to the Leicester Corporation, left estate of the gross value of £23,220, with net personality of £18,384.

Mr. C. F. Butler, who has acted as Managing Engineer to the Lewes & District Electric Supply Co. for the past four and a half years, has been appointed Resident Electrical Engineer to the Citenhage Electric Lighting & Power Co., Cape Colony.

MISCELLANEOUS CITY NOTES

DIVIDENDS ANNOUNCED.—Westminster Electric Supply Corporation, interim dividend for the June half-year at the rate of 10 per cent. per annum.—Metropolitan District Railway Co., 4 per cent. on the guaranteed stock, and 3 per cent. per annum on the 5 per cent. extension preference stock, placing £10,000 to renewals, and carrying forward £8,527.—Dublin & Lucan Electric Railway Co., 5 per cent. on the preference shares for the June half-year.—Hove Electric Lighting Co., interim dividend on the ordinary shares at the rate of 8 per cent. per annum.—Chelsea Electric Supply Co., interim dividend at the rate of 4 per cent. per annum.

Brompton & Kensington Electricity Supply Co., interim dividend for the June half-year at the rate of 9 per cent. per annum.—Vickers, Sons & Maxim, interim dividends for the June half-year of 2½ per cent. on the preferred 5 per cent. stock, and 5 per cent. preference shares, and 1s. per share on the ordinary shares, free of tax.

Charing Cross, West End & City Electricity Supply Co., interim dividend at the rate of 5 per cent. per annum on the ordinary shares on the West End undertaking.

Telephones on Trains.—A successful experiment in train telephony was made last week by permission of the London, Brighton & South Coast Railway Co., by Mr. H. von Kramer, of Birmingham. Full technical particulars of Mr. Kramer's system are not yet available, but it appears that the instrument on the train is connected to a large coil of insulated wire in a longitudinal vertical plane, completely encircling one coach, and that the speech currents in this circuit are reproduced in a stationary circuit comprising two insulated wires laid parallel with the track between the rails, by magnetic induction. The lowest part of the large coil is eighteen inches from the stationary wires, and there are, of course, no rubbing contacts. The wires were laid along a four-mile length of track between Horley and Three Bridges, and a van of a fast Brighton train was put at Mr. Kramer's disposal. Conversation was carried on between the train, running at full speed, and the signal-box at Three Bridges, and is stated to have been most clear and distinct. We understand that the chief difficulty in developing the system has been the elimination of disturbances due to the telegraph wires along the track. According to the *Daily Mail*, the Brighton Company will equip the line between London and Brighton on this system next winter, so that passengers travelling by the express trains will be able to send or receive telephone messages during the journey. The consent of the General Post Office will have to be obtained, however. A possible application of the system will be its use for communication between trains and signal-boxes in time of fog.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £57 15s. to £58 5s. per ton (last week £57 5s. to £57 15s.).

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—An application will be made on October 13th at the Court House, St. Thomas' Street, Portsmouth, for the discharge of H. K. Barham, trading as the South of England Electrical Engineering Co.

The last day for receiving proofs in the bankruptcy of A. E. Felgate & W. Storey, trading as Felgate & Storey, electrical engineers, 10 Queen Victoria Street, Reading, is August 5th. The trustee is B. P. Allnatt, 2 Forbury, Reading.

W. L. Grimsley, electrician, Shelley Road, Boscombe, Hants, has been adjudicated bankrupt. The first meeting of creditors will be held at the Arcade Chambers, Bournemouth, on July 30th, at noon, and the public examination will take place at the Town Hall, Poole, at 11.30 a.m., on August 26th.

CANADIAN AGENCY.—A London firm manufacturing arc lamps, transformers, and metal filament lamps wishes to appoint reliable agents in Ontario and Manitoba. Particulars from the High Commissioner for Canada, 17 Victoria Street, London, S.W.

ELECTRICAL FOOTBALL LEAGUE.—There are a few vacancies in this league for clubs connected with the electrical industry. Full particulars from Mr. C. Phillips, 140 Minet Avenue, Harlesden, London, N.W. Referees with vacant dates please write to Mr. Fraser, 100 Bishop Road, Fulham, London, S.W.

COMPANIES' MEETINGS AND REPORTS

ALLGEMEINE ELEKTRICITATS GES., BERLIN.—A dividend of 14 per cent. is proposed, as against 13 per cent. in the previous year.

METROPOLITAN RAILWAY CO.—The receipts for the June half-year show an increase of £12,000 over the corresponding period of last year, and the expenses £776. There is a net revenue of £146,379 after placing £10,000 to electrical renewal and depreciation fund. After payment of the preference dividend and £1 5s. per cent. per annum upon the ordinary stock, a balance of £6,043 remains.

The meeting was held on Wednesday last week, Sir Charles McLaren, Bart., M.P., presiding. The installation of automatic signalling between Baker Street and Neasden will soon be completed, and the Pullman car service between Aylesbury and the City had proved satisfactory. The proposed L.C.C. tramways from Swiss Cottage to Marylebone Road, and from Marble Arch to Baker Street, were referred to as introducing serious competition with the company, and the board have decided to strenuously oppose the proposals when they go before Parliament.

CHATHAM & DISTRICT LIGHT RAILWAYS CO.—There was a net profit of £6,090 on the June half-year's working. After meeting the 5 per cent. preference dividend, and 2 per cent. per annum on the ordinary shares, the sum of £2,090 is carried forward. The traffic receipts show an increase of £1,242.

UNITED RIVER PLATE TELEPHONE CO.—At the annual meeting last week it was stated that by the end of the present year the principal exchanges in Buenos Aires will have been changed over to central battery working.

REES ROTURBO DEVELOPMENT SYNDICATE.—The royalties for the June half-year amounted to £1,610, compared with £1,108 in the corresponding period of last year. The experiments with air pumps and condensers conducted at the works of the Rees Roturbo Manufacturing Co. during the past six months have been fruitful in results, and the latter company are now placing these machines on the market. An interim dividend at the rate of 5 per cent. per annum is declared.

DUBLIN UNITED TRAMWAY CO.—The directors' report for the half-year ended June 30th gives the amount available for division as £45,191 4s. 8d., out of which it is recommended that dividends be paid for the half-year at the rate of 6 per cent. per annum, less income tax, on both the preference and ordinary shores, and that a sum of £4,000 be set aside towards the renewal of cars. The dividends and the sum set aside will absorb £37,000, leaving £7,291 4s. 8d. to be carried to next account.

CENTRAL LONDON RAILWAY CO.—The report for the June half-year states that the number of passengers carried was 20,664,869, compared with 18,989,109 in the corresponding period of last year. A contract has been entered into for the construction of the extension to Liverpool Street, and also for the making of the public subway between the Bank Station of the Central London Co. and the booking hall of the City & South London Co. in King William Street, the cost of which will be borne equally by the two companies. The net revenue for the half-year was £70,711, compared with £64,140 in the corresponding period of last year. After meeting dividends of 5 per cent. on the undivided ordinary stock and 4 per cent. on the preferred stock, a balance of £45,805 is carried forward.

HARPER ELECTRIC PIANO CO.—The report for the year to June 1st mentions that the new company has gone to allotment, and that the purchase of the company's assets by the Harper Electric Piano (1910) Co. takes place as from June 30th. A dividend at the rate of 15 per cent. per annum is declared upon the deferred shares, making 10 per cent. for the year, and a balance of £1,888 is carried forward.

CROMPTON & CO.—At the annual meeting last week Mr. John Trotter said that although politically he was not a protectionist, he had to confess that, with regard to the electrical industry, there seemed little hope under present fiscal conditions of our manufacturers reaping proper rewards.

NATIONAL TELEPHONE CO.—At the half-yearly meeting last week, reference was made to the coming acquisition of the company's business by the Post Office. Negotiations are proceeding for the preparation of the inventory of the company's plant, and it is hoped that an agreement minimising the contentious objections will be come to. Mr. George Franklin, the President of the company, emphasised their determination to maintain the plant in an efficient state to the very last, as it was to the company's advantage to do so.

GREAT NORTHERN & CITY RAILWAY CO.—There was a loss of £3,163 on the past year's working, which has been met, as usual, from outside sources, in order to meet fixed charges. The number of passengers carried was 5,966,114, against 6,041,755 for the corresponding period of last year.

LANCASHIRE ELECTRIC POWER CO.—Mr. H. F. Parshall presided at the annual meeting last week, and stated that the load had increased by 1,750 h.p. during the year. The average consumer's installation was about 200 h.p., and the bulk of the business was done with cotton mills. There are at present about 2,800 h.p. contracted for, but not connected. As a result of the recent Board of Trade decision with regard to Radcliffe, the directors hope to be able to come to satisfactory terms with that Council, as they were certainly not able to supply power at reasonable terms.

Wireless Telegraphy.—The compulsory wireless Act, which has just become law in the United States, provides that "after July 1st, 1911, it shall be unlawful for any ocean-going steamer of the United States, or of any foreign country, carrying passengers and carrying 50 or more persons, including passengers and crew, to leave or attempt to leave any port of the United States unless such steamer shall be equipped with an efficient apparatus for radio-communication, in good working order, in charge of a person skilled in the use of such apparatus, which apparatus shall be capable of transmitting and receiving messages over a distance of at least one hundred miles, night or day." Steamers plying only between ports less than 200 miles apart will be exempt from the Act. The apparatus will not be deemed efficient unless it is possible to exchange with it messages with shore or ship stations using other systems.

At a meeting last week, at Newcastle, of the North of England Steamship Owners' Association, consideration was given to the Bill now before the House of Commons for compelling ships leaving British ports to carry wireless apparatus. After some discussion, the matter was referred to a sub-committee to draft a resolution embodying objections to the provisions of the Bill.

The British Acting Consul-General at Rio de Janeiro (Mr. E. Hambloch) reports that, according to the *Jornal do Commercio* of June 28th, in view of the excellent results that have attended the trials of wireless telegraphy on the Madeira-Mamoré Railway, the Minister of Public Works has been authorised by the President of the Republic to receive proposals for the installation of radiographic stations (Marconi system) in the three prefectures of Acre. The Acting Consul-General adds that there may or may not be a public call for tenders in this connection.

Parliamentary.—The London County Council (Tramways and Improvements) Bill was read a third time in the House of Lords on Thursday.

London Electric Supply Bill was read a second time in the House of Lords on Wednesday last week.

Royal assent was given last week to the following Bills:—Dunfermline & District Tramways (Extensions) Order Confirmation Act, 1910; Wemyss Tramways (Extensions) Order Confirmation Act, 1910; Electric Lighting Orders Confirmation (No. 3) Act, 1910; Bishop's Stortford, Harlow, and Epping Gas & Electricity Act, 1910; Yorkshire Electric Power Act, 1910; Reading & District Electric Supply Act, 1910; London Electric Railway Amalgamation Act, 1910; Metropolitan Railway Act, 1910; Nottingham Corporation Act, 1910; Belfast Corporation (Tramways) Act, 1910; Wimbledon & Sutton Railway Act, 1910; and Baker Street & Waterloo Railway Act, 1910.

In the House of Lords on Wednesday last week a new Standing Order was agreed to by which plans of all works affecting street traffic in the metropolis, forming the subject of Bills, must be deposited with the Commissioner of Police by November 30th in each year. The object of this new Standing Order is to facilitate the work of the Commissioner of Police in making his reports to the Home Office on traffic questions in London. An amendment was moved, substituting the Traffic Branch of the Board of Trade for the Commissioner of Police, but this was negatived, and the new Standing Order was agreed to.

SUMMARY

A LETTER from a station engineer complains of the action of a gas company which is alleged to have removed street metal filament lamps "for testing." Mr. W. P. Durtnall writes further regarding his recent opposition to a patent. We have received a letter from an ex-employee of the National Telephone Co. with regard to the dismissals of the staff which have taken place in view of the expiry of the company's licence and the transfer of the undertaking to the Post Office at the end of 1911. (Page 516.)

A SHORT article discusses a suggestion for the formation of an Association of Motor Manufacturers on the lines of the Cable Makers' Association. (Page 512.)

A PAPER read by Mr. J. M. Jockell before the Junior Institution of Engineers contained some interesting notes on the care of commutators. (Page 517.)

A SAFETY device to enable repair work to be done on overhead lines at pressures up to 7,500 volts is to be introduced into this country. It consists of a thick rubber trough or mat, and one is placed over each of the wires near which the man is working. (Page 518.)

WE publish some remarks made by Mr. Corbet Woodall at the half-yearly meeting of the Gas Light & Coke Co., with regard to the competition between gas and electricity for street lighting. (Page 518.)

OUR monthly article on new electrical supplies and accessories appears in this issue. Illustrations are given of a new tubular tantalum lamp and a useful extended shade ring. The latest forms of the "Tricity" cooker, which is suitable for continuous as well as alternating currents, are also described, and other apparatus mentioned includes small accumulators and appliances for charging them. (Page 519.)

THE following books are reviewed in this issue: "Electrotechnics," by J. Henderson; "Continuous-current Dynamos and Motors and their Control," by W. R. Kelsey; "Elementary Electrical Calculations," by T. O'Conor Sloane; "First Stage Sound, Light, and Heat." (Page 520.)

A SHORT communication describes the aims and objects of the newly formed Association of Consulting Engineers. Membership is limited to corporate members of the Institution of Civil Engineers. (Page 521.)

MR. C. C. F. MONCKTON contributes an account of some experiments on harmonics in wireless telegraphy. (Page 521.)

AMONG the specifications published by the Patent Office on Thursday last is one by Dr. Forbes Ross for a heater for liquids consisting of a resistance spiral wound on a porcelain core and enclosed in a quartz tube with a packing of plaster of Paris.—C. B. Walker describes a slow-working quick-break movement for automatic battery regulators and motor-starters.—Dr. F. Salzer protects the wire supports of metal filaments by covering them with an electrolytically deposited coating of chromium.—A patent by R. Jahoda covering the use of silver and copper to strengthen metal fila-

Digitized by Google

ments during manipulation before sintering is opposed. —K. Maxaner has been granted a patent for a centrifugal fan in spite of opposition. (Page 522.)

An Electrical Conduit and Fittings Association has been formed; the majority of electrical conduit firms have joined it, and the prices of several firms supplying interior conduit have been raised to the level of those of the firms whose prices were higher previously. The proposal of the I.M.E.A. for a Bill to give all municipalities wiring powers is being considered by various local authorities all over the country. We comment also on the position of the wiring contractor in regard to the pending metal filament patent action. (Page 523.)

An important announcement has been made which points to a concentration of interests by the A.E.G. and the Lahmeyer Co. in Germany. (Page 523.)

A new type of tramcar, requiring only one official, is to be tried at Glasgow.—The Halifax tramway undertaking shows a profit of over £13,000 for the past year. —The Rochdale electricity undertaking has resulted in a profit of £5,171.—The South Shields electricity undertaking has been adversely affected by the metal filament lamps, and a loss of £106 has been made on the year's working.—The foundation stone of the extensions to the Wigan Electricity Works was laid last week. (Page 524.)

Local Government Board inquiries have been held for loans at Fleetwood (£4,100); Leicester (£19,190); and Wimbledon (£6,600). Switchgear is required at Eccles, and tenders are invited for the reconstruction of permanent way at Bournemouth. (Page 524.)

The Metropolitan District Railway has made a profit of over £62,000. The Great Northern & City Railway shows a small credit balance. Dividends of 3 per cent. and 2 per cent. on the "A" and "B" ordinary shares are recommended in the case of the Baker Street & Waterloo Railway, and ¾ per cent. for the Charing Cross, Euston & Hampstead Railway. For the Great Northern, Piccadilly & Brompton Railway a dividend of 1½ per cent. is recommended. (Page 526.)

CORRESPONDENCE

GAS COMPANIES AND METAL FILAMENT LAMPS.

To the Editor of Electrical Engineering.

Sir,—Electrical engineers whose Councils are considering the lighting of their streets by metallic filament lamps, or who at present use this means of lighting, are warned that recently a gas company in London was found to temporarily remove the lamps from columns during lighting hours, their object in doing so being stated to be "for testing."

Viewing the fragile character of the metallic filament lamp, it cannot be stated to be just competition to tamper with such apparatus; moreover, the fact that all tests as to efficiency of lighting can be carried out without interfering with the source of light, whether it is gas or electric, renders such an action unjustifiable. Although one cannot but admire the persistence with which the gas companies are waging a hopeless warfare in endeavouring to recapture street lighting, I think they have overstepped the bounds of commercial morality and have, at the same time, committed a breach of the law.

Yours faithfully,
Station Engineer.

SLOW-SPEED MOTOR DRIVE.

To the Editor of Electrical Engineering.

Sir,—We require a ¼ h.p. electric motor, continuous-current, 200 volts, fitted with reduction gear to reduce speed to about 18 r.p.m., and, if possible, emitting no greater noise than that caused by an ordinary electric motor. We have written to the firms advertising in your paper, but as it is quite possible you may know of other firms who make a motor of this description, perhaps you will be able to give us the name of a most likely house. It is quite possible that a clockwork motor would be obtainable for fulfilling these requirements, and as the machine for which the motor-power is required may be used in country districts (where electric power is not available), a motor of this type would be preferable. Could you give us the names of any firms who make spring or clock motors of this character?

Yours faithfully,
Goodhouse, Ltd.
L. Hill.

165 Fleet Street, E.C.
August 8th.

[Perhaps some of our readers may be able to give the desired information.—Ed. E.E.]

ELECTRICAL MARINE PROPULSION.

To the Editor of Electrical Engineering.

Sir,—I notice in your last issue that you again refer to matter of the recent opposition that I made in connection with the application of Mr. Parsons and others for a patent for the above method of ship propulsion.

May I again draw your attention to the fact that Mr. Parsons' patent is sealed on the understanding that it refers to a method of *winding* the generators and motors *only* in such systems of ship propulsion.

The question of the combination of a high-speed turbo-generator with stationary armature, and a slow-speed induction motor, forming a speed reduction gear for ship propulsion, is the subject of my master patent, No. 17,248—1905. The opposition that I made was not in connection with Mr. Parsons' *winding*, but in connection with the fact that such an electrical speed-reduction gear had been proposed before in my above patent; as the matter stands to-day no specification has been put up which shows a similar arrangement to that proposed in my invention of the above combination, and for the above purpose. Mr. Parsons' patent is not for a system of propulsion, but a method of *winding* only.

I shall be obliged if you will kindly publish the above, as you state that the above patent was granted, in spite of my opposition, which is not a correct statement of fact for the above reasons.

Thanking you in anticipation,

Yours faithfully,
William P. Durtnall.

August 8th, 1910.

THE NATIONAL TELEPHONE CO.'S STAFF.

We have received an extremely long letter, signed "Telephonist," complaining of the dismissals of the company's constructional staff which are occurring in view of the expiry of the company's licence and the acquisition of the undertaking by the Post Office at the end of next year. The letter states that "whereas in the ordinary course of business the company would be carrying on their constructional works and be providing for the replacement of the more antiquated of their exchanges by the modern central battery system, they are now closing down all these constructional works and dismissing and placing upon 'short time' those of their staff who would have been employed upon these very necessary works." The writer further states that "proposals have been made by the Postmaster-General which, if accepted by the company, would have allowed of the uninterrupted carrying on of such works, and have allocated to the company and to the Post Office due proportions of the cost according to the benefit derived by the parties from the new plant erected and the plant replaced, . . ." but that the Board of the National Telephone Co. have refused these offers, and have thereby caused extreme hardship to their staff, many of whom are threatened by years of unemployment after having served the company for periods of five, ten, and twenty years. The writer, who states that he is an ex-employee of the National Telephone Co., also contends that, unless some immediate action is taken, the spare plant at the disposal of the Post Office for new telephone lines will be altogether insufficient if the telephone system continues to expand at the same rate as during the past five years, as he estimates that the time taken to enlarge a telephone exchange or to reconstruct underground or overhead line routes varies from twelve months to two years, according to the size and character of the job. He points to the risk that, when the Post Office is in a position to do the necessary constructional work themselves after the end of 1911, the skilled staff which will be required will have been dispersed, and it will be found impossible to gather together a sufficient number of practical men to cope satisfactorily with the arrears of work which will have accumulated due to the present policy of the company.

Supply Meters.—The M.H. type continuous current ampere hour meter of the British Thomson-Houston Co. has been approved by the Board of Trade.

Penny-in-Slot Lamp-posts.—A correspondent of the *Daily Mail* writes that the local authorities of Jocketa, a village in Saxony, have recently installed electric light in the streets of the village and have provided a novel addition in the form of penny-in-slot machines attached to certain lamp-posts. The lamps are switched off at 11 p.m. every night, but should a resident in the village return home later than this, he can insert a penny in a slot machine and light up the whole village for a short time.

PRICES AND RATING OF MOTORS

ONE of the worst features of the manufacturing side of electrical engineering is the excessive price-cutting which has characterised the sale of electrical machinery during the last few years, an evil which appears to be showing very few signs of diminution. It is even said that motors are being offered in this country at prices which must be below the bare cost of material alone. Along with this cutting down of prices in the race to obtain orders there comes naturally a tendency to cut down quality and to adopt absurd ratings and unduly high speeds. We propose here to examine a suggestion, which has been made to us, of a possible means whereby this state of affairs can be alleviated to some extent.

The suggestion is that, as far as small and moderate-sized motors are concerned, some sort of association might be formed between the leading British manufacturers, analogous to the Cable Makers' Association, with the object of drawing up a standard specification of such motors and coming to an agreement as to the prices at which these are to be sold. This would have the dual object of ensuring that the customer, even if he was paying more than he is at present, was really getting his money's worth, and not a "cheap and nasty" machine, and making it possible for the manufacturer to earn a fair profit. It would probably be advisable to allow members of the association to be free to manufacture "non-association" brands of motor as well. A system such as this should have the effect not of removing competition, but directing it into matters of quality rather than price; nor would it in any way take away the incentive to practising economies in manufacture. The matter is probably of more moment to the small manufacturer who does not build heavy plant and has few strings to his bow than to the large firm which thinks it good policy to sell part of its manufactures below cost to keep down the percentage of standing charges, and looks for its profit in other directions.

The arrangement of such a scheme is, however, not such a simple matter as it appears at first sight, as it is largely bound up with questions of rating. Unless a standard range of standard outputs and speeds were agreed upon, there would be a tendency for an order to go, as is often the case at present, to the firm who listed a standard machine nearest to the output specified. On the other hand, it would be out of the question to ask all the manufacturers to go to the length of re-designing and re-standardising their lines of machines. Again, the exact form of the rating specification is of great importance, as the temperature rise allowed, the length of the test run, and the magnitude and duration of the overloads all influence the design of the motor which best fulfils it. For different classes of work, motors of widely different characteristics are required, and very different specifications should be drawn up for motors for continuous running on constant load, or variable load and for intermittent running. The difficulties in the last case are considerable, as has been shown in a recent Paper by Dr. R. Pohl before the Yorkshire Local Section of the Institution of Electrical Engineers. (*See* ELECTRICAL ENGINEERING, March 31st, page 217.) It may perhaps be said, however, that the utmost refinements of rating and testing are often completely thrown away owing to the extreme vagueness of the requirements and the difficulty of predetermining the actual work a motor will have to perform.

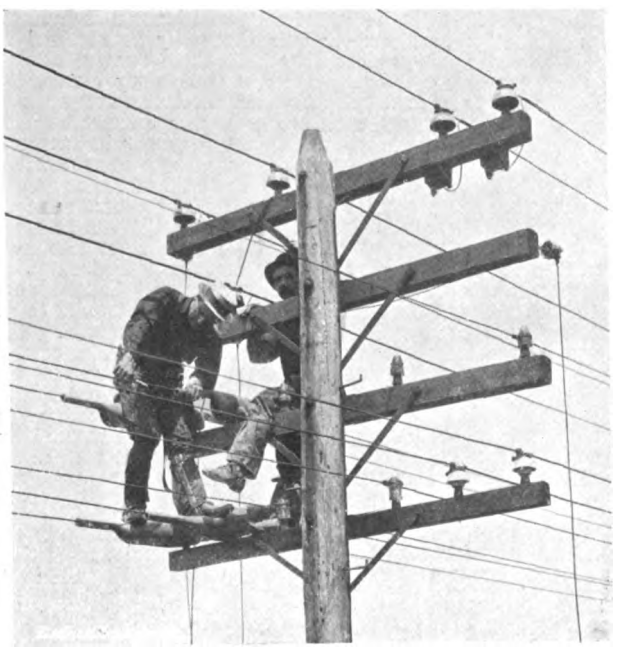
The success of the scheme largely depends on the details of the rating specification, as the slightest irregularity will make the customer take refuge in a non-association machine and defeat the ends of the arrangement. It would, however, always be to the interest of the manufacturers to sell an "association" rather than a "non-association" motor, and this in itself should act as an incentive to keep the standard specification up to date and in accordance with requirements, while the presence of the non-association machines on the market would prevent the prices being raised above figures allowing a fair margin of profit.

THE CARE OF COMMUTATORS

IN the course of a Paper read recently before the Junior Institution of Engineers, entitled "Notes on the Running of an Electricity Works," Mr. L. M. Jockel made some remarks founded on practical experience on the care of commutators.

The surface of the commutator must be kept clean and smooth if good commutation is to ensue. When the machine is on load the commutator can be kept clean by the occasional application of a pad or cloth soaked with benzine, and afterwards finishing off with a clean dry cloth. The use of good quality carbon brushes obviates the necessity of lubricating the commutator, but occasionally the brushes cause an excessive noise or "hissing," and this is usually remedied by the application of paraffin wax or a slight trace of mineral oil. Paraffin wax has the disadvantage that it accumulates on the brushes along with the copper and carbon dust, and is troublesome to remove, and it also causes the machine to drop its load slightly when it is applied. The use of a slight amount of mineral oil is very beneficial in promoting a good running skin or surface on the commutator, and this treatment is applied regularly to the machines in the Royal Navy. With special brushes such as the "Morganite," a hard, smooth skin can easily be obtained on the commutator. A common trouble is the formation of flats on the commutator. These may arise from many causes, but are often due to neglected slight sparking. A frequent cause of sparking is the unequal wear of the copper commutator bars and the mica insulation. The trouble can usually be overcome by turning or grinding out the bad mica or in some cases by sawing out the mica until it is below the level of the segments. If a lathe or emery-grinder is not available, recourse must be had to hand work, and a somewhat temporary job can be made by using a file moistened with paraffin or a light lubricant. Should the flat not be very deep, it may be ground out with emery-cloth or glass-paper, using a wooden pad hollowed out to the curvature of the commutator and carefully bedded to it. The brushes can be quickly bedded down by increasing the pressure on the springs, and using emery-cloth. The correct pressure on the brushes is usually from 1½ to 3 lb. per sq. in. of bearing area, and this can be ascertained by using a spring balance. After trueing up a commutator, and rebedding the brushes, a good working surface can generally be secured by frequently cleaning the commutator, and treating it with slight applications of good mineral oil or vaseline.

German Export Trade in Electric Lamps.—According to an American consular report, the export of incandescent lamps from Germany has steadily increased since 1901, when it amounted in value to about £130,000. In 1907 it had reached some £400,000, and in 1909 it was £1,570,000. The value of the exported lamps in the first quarter of 1910 was put at £755,000, as against £347,000 for the corresponding three months of 1909. The increase is said to be due to greater shipments to this country, Austria-Hungary, Argentina, Russia, Denmark, and Italy.



New Telephone Exchange at Melbourne.—It is expected that the new central telephone exchange, now being erected in Melbourne, Australia, will be out of the hands of the contractors, the Western Electric Co., in about eight months' time. The large common battery switchboard is capable of carrying 11,700 subscribers' lines, but at present it will be fitted with 9,000 only. Meters for automatically recording the number of calls are installed. Tunnels carrying heavy lead cables, each containing 260 pairs of wires, extend for a considerable distance underground.

High-Speed Telegraphy.—A system of high-speed telegraphy with some novel features has been devised by Mr. Hans Knudsen, and is being developed by a syndicate called the Knudsen Express Cable System. Instead of representing each letter by a group of long and short impulses as in the Morse system, only one short impulse is transmitted per letter, each letter being represented by the distance or time between two successive impulses. Three machines are employed. The first has a typewriter keyboard, and this punches holes in a tape, the distance between the holes representing the letters. This perforated tape is passed through a transmitter at a uniform speed so that the different letters are represented by different times between successive current impulses. A tape passes through the receiving instrument at the same uniform speed, and the distance between the marks made on it are then read off by means of a rule graduated in the letters of the alphabet. Mr. Knudsen claims a reduction in time of 75 per cent. over the Morse system for the actual transmission of the message, which means that the capacity of a cable working on this system would be four times its capacity on the Morse system.

REPAIR WORK ON LIVE H.-T. OVERHEAD LINES

OUR attention has been drawn to a safety device of American origin which is shortly to be placed on the British market. This device has been designed for the purpose of enabling linemen to do repair and other work on overhead transmission lines working at high pressures up to 7,500 volts, and is stated to have been adopted by over two hundred power companies in the United States. As can be seen from the accompanying figure, the device, known as a "shield," consists of a thick rubber trough. This is laid over the wire and firmly clamped to it by means of two hard rubber split rings, which are passed over the tubular extensions of the trough at each end. The trough portion is large enough to fit over insulators, and when working on any set of wires, each wire which the man may come in contact with is covered by a shield, except that wire on which he is working. Thus, in the illustration, one of the men is shown cutting the insulation from one wire of a three-phase line, with an uninsulated knife held in his bare hand, and we are assured that the line was alive at 4,600 volts at the time. Though the man is thus charged to the full high pressure, he is insulated from earth and from the other wires, and is therefore protected from shock. The manufacturers recommend the use of these shields on circuits up to 7,500 volts only, as, although they are tested in water up to 30,000 volts, they consider that on damp days the man might get a shock on circuits of higher pressures. They also recommend the use of rubber gloves as an additional precaution against shock.

WORKING ON A LIVE 4,600-VOLT THREE-PHASE LINE.

Line superintendents in this country do not like, nor are they generally permitted, to allow their men to work on live H.-T. circuits, but in America it is very usual, even on extra high-pressure circuits. It is frequently highly inconvenient to both the power company and its customers to be obliged to shut down a heavy transmission line in order to carry out a trivial repair, but this is generally considered to be necessary in European countries. There have been a very large number of accidents due to linemen coming into contact with live wires, but it appears to be thought absolutely necessary that repair work should be carried out without shutting down the line; and much attention is being given to the subject of devices for rendering such work less dangerous.

We are informed that in the case of one company in America, who had used the above device for eighteen months, it had been found possible to carry out all repair work, tapping and connection, or removal of transformers, without shutting down any circuits and without any accidents. Previous to their use, two men had been killed while working on live wires. Readers desiring further information regarding this device should communicate with Mr. E. W. Stevenson, at 14 Union Court, Old Broad Street, London.

GAS COMPANIES AND STREET LIGHTING

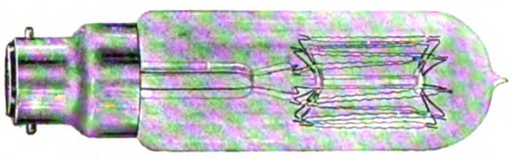
IN view of the circumstances in connection with the street lighting contracts in Westminster, it is interesting to quote the remarks made by Mr. Corbet Woodall, who presided at the half-yearly meeting of the Gas Light & Coke Co., on Friday. An arrangement had been come to with the Corporation of the City of Westminster, he said, for the improved lighting of the district, and he felt sure that the result would surprise the inhabitants of London generally. A similar arrangement had been made with the Corporation of Finsbury, but he regretted "that the corporation of one of the North London boroughs had decided, in the interests of its own electrical department, to substitute electricity for gas." This Company's tender, he continued, would have given to that borough an amount of light 70 per cent. in excess of the light it would enjoy when the change was made, and at no more cost, "but these were considerations that would not weigh when the assumed interest of a municipal electrical department was concerned." It is a pity that Mr. Woodall did not quote actual figures, and it would have been interesting to know whether the Gas Light & Coke Co. are offering the same extravagantly low prices to the other London Boroughs as they did to the Westminster City Council.

The Birmingham Boundaries Extensions.—After a long hearing the House of Commons Committee have passed a Provisional Order made by the Local Government Board, extending the boundaries of the City of Birmingham. The Bill has some interest to electrical engineers, inasmuch as the districts of West Bromwich, Handsworth, and King's Norton are included in the scheme. Each of these Local Authorities have at present their own electricity works, and if the precedent of Stoke-on-Trent is followed, the local electricity works of these districts will be absorbed into the Birmingham undertaking, and probably station superintendents placed in charge.

Train Lighting.—According to the report issued by the Swiss State Railway authorities for the year 1909, there are 2 496 railway carriages (or 72·2 per cent. of the total number on the railways) already equipped with electric lighting. Gas lighting is used for only 15 per cent., and petroleum lighting for the remaining 12·8 per cent. All new cars for the main lines and most of the new cars for local lines are being fitted with electric lighting.

Electricity in Agriculture.—The British Consul for the province of Pomerania, Germany, states that a number of small power stations have been erected in various parts of the province for supplying current to neighbouring towns, villages, estates, and farms. The largest station is at Rosswitz, with 116 miles of overhead lines; the second in size is situated at Lottin with 83·2 miles of overhead lines. Two smaller stations are at Crüssow and Schmolsin. Additional stations are in course of erection. These works are principally controlled by associations formed by landed proprietors, and sums have been voted by the Provincial Representative Chamber to assist them.

Overhead v. Underground Telephone Lines.—The Croydon Corporation have been unsuccessful in an appeal to the Railway and Canal Commissioners against a decision by which the Post Office were permitted to erect certain overhead wires for telephones in Croydon. It had been urged that they would disfigure the roads, constitute a danger and a nuisance, and would depreciate the value of the house property; but, on the other hand, the difference in cost between overhead and underground wires in the particular case worked out to over £700. If in any particular streets the Corporation desire to have the wires placed underground and are willing to defray the difference in cost, this will be done.



Electric Railways in Japan.—The following particulars are taken from a recent American Consular report:—The four miles of the Kobe Electric Co.'s line, opened in April, cost £300,000. The generators, rails, poles, and air brakes are American, the equipment of the cars English, and the cars and overhead equipment Japanese make. The Minomo-Arima Electric Railway Co.'s 18-mile line to mountain summer resorts, opened in March, cost £400 000. All the machinery is American, the cars and overhead equipment Japanese make. The Keihan Electric Railway, 28 miles long, was opened in April, and connects Osaka and Kyoto. The £700,000 capital was expended, and a debt of £250,000 contracted. The materials nearly all came from England, though the overhead wires came from the United States: the woodwork of the cars was made in Japan. The Keishin Electric Railway, from Kyoto to Otsu, and the Uji Electric Railway, from Fushimi to Uji, now building, will connect with this line. The Hyogo Electric Railway opened its first section—from Hyogo to Suma—on March 15th; it will extend 12 miles along the shore of the Inland Sea to Akashi. The material has chiefly come from the United States, the woodwork of the cars and the overhead wires being made in Japan.

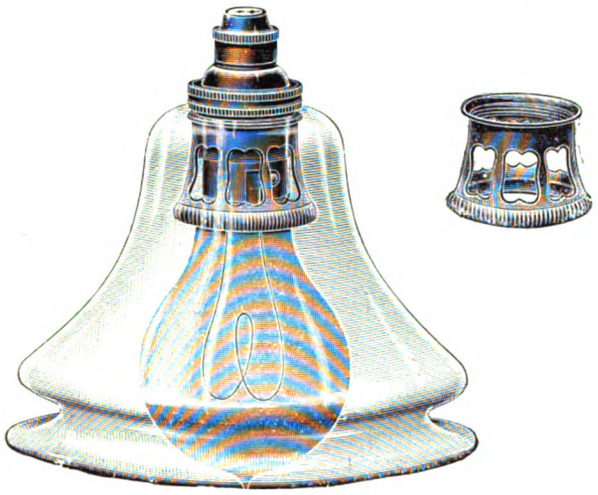
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Incandescent Lamps.

The newest form of Tantalum lamp to be put on the market by Messrs. Siemens Brothers Dynamo Works, Ltd. (Incandescent Lamp Department, Tyssen Street, Dalston), is illustrated here. It has a tubular bulb 1½ in. diameter and



New Tubular Tantalum Lamp.

5¼ in. in length, and is made in the 25 c.p. size for 100 to 130 volts for single or series running on continuous or alternating circuits, with an efficiency of 1·7 watts per c.p. These lamps should prove of considerable use in connection with strip reflectors for shop windows and concealed decorative lighting.

Fittings, Switches, and Accessories.

The Sun Electrical Co., Ltd. (118 Charing Cross Road, London, W.C.) have introduced a new design of extended shade ring, which should be found useful in hotels, restaurants, shops, and other places where the lamp-shades are

Extended Shade Ring.

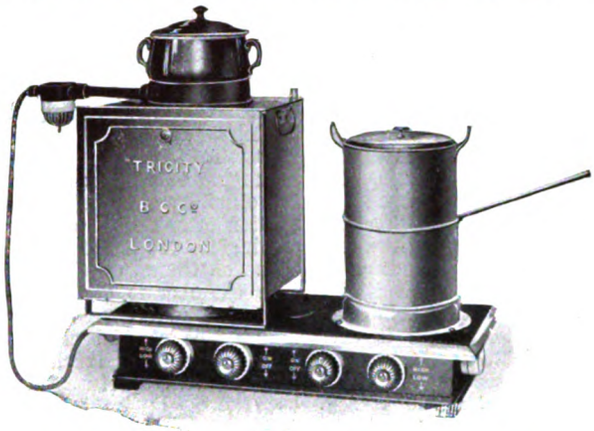
exposed to much dust and require frequent removal for cleaning. As shown in the accompanying figures, the shade ring can be readily removed without the aid of any special tool, even when the shades have narrow openings. The ring is threaded to screw on to all standard B.C. holders, and will carry all shades with 1⅛ in. hole.

Heating and Cooking Apparatus.

The Berry Construction Co., Ltd. (29A Charing Cross Road, W.C.) have issued a new list of their "Tricity"

Fig. 1.—Single Cooker with Extension Cooker.

cookers and cooking ranges. They have now a complete set of D.-C. apparatus, similar in external appearance and in wattage and output, and also in price, to their well-known A.-C. cookers. The apparatus in both cases can be supplied for any pressures from 100 to 120 and 200 to 240 volts. It is particularly the strong mechanical construction of these cookers that calls for admiration, and this is carried even to the flexible armoured conductor and plug. The two illustrations show the "single" and "duplex" cooker respectively, each fitted with an "extension cooker," which can be supplied with either if desired. The unit to the left of Fig. 1 measures 11 in. by 16 in. by 9 in., and consumes 800 or 200 watts, according to the position of the switches. The



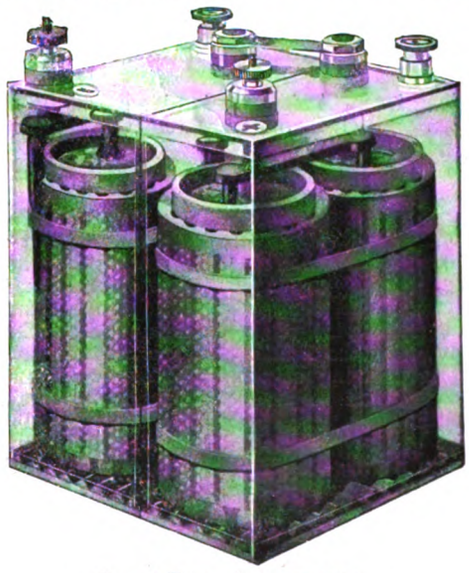


Fig. 2.—Duplex Cooker with Extension Cooker.

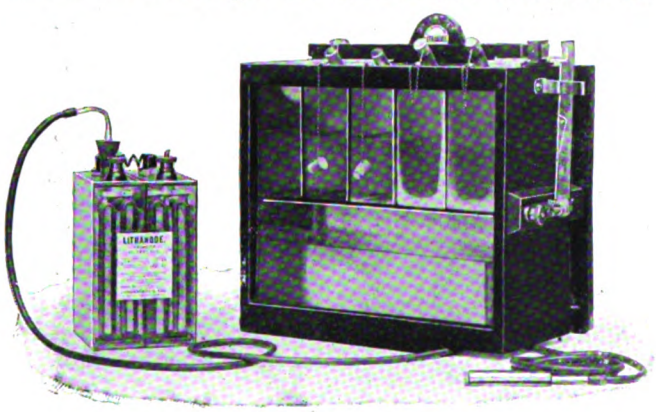
oven to the right of this can be removed from the hot plate and can be used as a stand for the "extension cooker," which is another hot plate controlled by a two-way switch, and consuming either 800 or 200 watts also. It can also be used for the top heat of the oven. The duplex cooker (Fig. 2) has two plates, each consuming either 800 or 200 watts, and controlled by its pair of switches, and two plug bases are attached to the cooker-case so that extension cookers or additional single cookers may be plugged up to increase the capacity of the outfit. In Fig. 2 the two plates are in use, and an extension cooker as well. The catalogue includes a full list of utensils for use with the apparatus.

Small Accumulators and Accessories.

A new series of portable accumulators for which a number of special advantages are claimed has been introduced by



Cox 4-Volt Accumulator.

Messrs. Harry W. Cox & Co., Ltd. (47 Gray's Inn Road, London, W.C.). These accumulators are covered by the patents of Mr. H. Joel, the special features being the circular plates and a porous earthenware separating cylinder between the plates of opposite polarity. The illustration shows a 60 ampere-hour, two-cell battery, with four sets of

Digitized by Google

electrodes. The dimensions of this battery in a stout oak case are 8¼ in. by 6 in. by 13¼ in., and the weight is 45 lbs. The discharge rate is 10 amperes for 6 hours, or 20 amperes for short periods. Although it would seem that the earthenware cylinders would materially increase the internal resistance, it is stated that they do not do so on account of their extremely high porosity. They afford the important advantages that internal short-circuiting and buckling of the plates are practically impossible. Among the other claims made are reduced weight and size for the same output, the possibility of charging and discharging at very high rates without injury, and retention of the charge for a long period when the cell is not in use. Another feature of these cells is the use of celluloid stuffing-boxes filled with vaseline for the terminals. These effectively prevent corrosion of the terminals. At present these batteries are listed in two sizes of 30 and 60 ampere-hours' capacity respectively.

A novel and ingenious device which may find favour amongst the many users of small portable accumulators has been introduced by Messrs. Longstreth's, Ltd. (190 Queen's Road, Battersea, London), the manufacturers of the well-known "Lithanode" accumulators. This device is an automatic switch for cutting off the charging current as soon as a battery is fully charged. It is worked by the gas given off by the cell, and requires no attention after having once been set. As shown in the accompanying figure, it consists of a celluloid chamber enclosed in a wooden frame, on the side of which is the switch itself. The chamber is divided horizontally into two halves. The bottom half contains water, and the upper half is divided into five vertical chambers, communicating with each other by means of small holes. Four of these chambers are provided with apertures at the top, which can be closed, as shown, by rubber corks. The end chamber on the left is in communication with the bottom of the lower chamber by means of a pipe, and contains a float consisting of two celluloid balls attached to the

Automatic Accumulator Charging Cut-out.

end of a long lever. This lever is pivotted at its other end, and holds in position the switch through which the charging current passes.

The gas given off by the cell is brought by means of a rubber tube into the lower chamber, and the water is slowly driven into the chamber containing the float. When the water reaches the top, the float is lifted and the switch released. Gas is given off, of course, during the whole period of charging, but the greater quantity is evolved when the cell is fully charged, and consequently, one size of chamber will be suitable for a wide range of cells. When charging at one ampere, only the float chamber is allowed to fill with water; when charging at two amperes, two chambers are allowed to fill, and so on—each chamber representing one ampere, until when charging at five amperes, all five are in use. To put any chamber into use, the rubber cork is removed from it; this allows the air to escape and the water to enter. Where a battery of several cells is being charged, the gas from one cell only is used to control the charging of the whole series. It is immaterial whether the battery has been completely or only partially discharged, and it is perfectly safe to leave cells charging over-night, provided the chambers have been tested for air-leakage before setting in operation by blowing down the gas tube until the water reaches the level of the float.

An ingenious appliance for facilitating the charging of small accumulators after lighting circuits has been brought out by the Accumulator Clip Co. (7 Cavendish Street, Keighley) in the form of a wooden spring clip, into which contacts connected to a flexible lead are embedded, so that connection can be made by simply springing the clip on to the terminals of the cell. The two jaws of the clip are clearly marked positive and negative.

REVIEWS OF BOOKS

Electrotechnics. By John Henderson. 165 pp. 7½ in. by 5 in. 38 illustrations. (London: Longmans, Green & Co.) 3s. 6d.

Although essentially a collection of instructions prepared by the author for the use of his students in the electrical department of the Borough Polytechnic Institute, London, this book is suitable for any students who wish to carry out a series of thoroughly practical experiments, and have the ordinary apparatus at their disposal. The book has been divided into three parts, corresponding roughly to a three years' course. The first part contains experiments corresponding to the elementary stage of the City and Guilds of London Institutes' syllabus in electrical engineering, whilst the second and third parts correspond to the D.-C. and A.-C. sections of the ordinary grade course of the same syllabus. The text is confined entirely to instructions for specific experiments, but in each case the instructions are preceded by a short explanatory statement, and a number of useful notes and hints are included. The book is illustrated with a few woodcuts of the more unusual pieces of apparatus, and diagrams of connections. The almost complete absence of curves is an advantage where college students are concerned, as it is best that they should not have a guide as to the curve their readings should follow, but in the case of private students there is perhaps a danger of their plotting the curves incorrectly and getting wrong impressions. The number of diagrams might also be increased with advantage. The experiments cover a large range, and are thoroughly practical. It is refreshing and also encouraging to the student to come across an experiment in the early pages dealing with the effects of the variation of resistance of carbon and metal filaments with the current. Other interesting and useful experiments dealing with the blowing currents of fuses, the efficiency of secondary cells and of incandescent lamps, &c., are met with early in the book, interspersed with the more usual laboratory work. Induction experiments, the measurement of permeability and hysteresis, the characteristic curves of D.-C. machines, and the testing of meters, are dealt with in the second part, while the third part is devoted to alternating-current experiments of a simple nature, including methods of measuring power and the taking of E.M.F. wave-forms. A useful collection of constants and tables is given at the end of the book.

Continuous-Current Dynamos and Motors and their Control. By W. R. Kelsey. Second edition. 346 pp. 7½ ins. by 4¾ ins. 192 illustrations. (London: The Technical Publishing Co., Ltd.) 7s. 6d.

After a concise exposition of the principles of electromagnetic induction, magnetisation, hysteresis, and other fundamental matters, the author describes ring armature windings which, though rarely employed in practice, are to some extent useful as a means of leading up to the consideration of drum windings. A large number of diagrams and tables are given in the chapter on drum windings, including the Arnold series-parallel winding and other unusual forms. The few notes on armature and commutator construction appear to be fairly representative of modern practice, but the inclusion in the section on field systems of a number of obsolete designs seems very unnecessary now that the circular frame radial pole construction is almost universal even for two-pole machines. In the calculations of the field windings, the losses and the commutation criteria, the approximate methods of Hobart are followed to a large degree. The objects of commutating poles and compensating windings are briefly explained, but in view of the extensive adoption of the former even in standard machines, one would expect further details as to their influence on the general design of D.C. machines. The calculations for a 12½-kw. 4-pole 800 r.p.m. generator are worked out in full on the usual lines in the chapter on design. The different types of motors are briefly described, and some notes on the design of motor starters are included. A separate chapter is devoted to traction motor design and control, and, in the section dealing with characteristic curves, an interesting diagram from which to obtain the behaviour of the motors of a car under any given running conditions is explained. The book concludes with some brief notes on the testing of D.C. machines.

Elementary Electrical Calculations. By T. O'Conor Sloane. 304 pp. 8 in. by 5½ in. Illustrated. (London: Crosby, Lockwood & Son.) 9s.

This book is a collection, with worked examples, of the elementary mathematical laws underlying the calculations which are met with in problems in electrical engineering, and should form a useful supplementary manual to the text-books dealing more with the physical side of the question. In the first forty pages the author briefly runs over the elements of algebra, mechanics, and physics with the idea of refreshing the reader's memory, and then deals in succession with Ohm's law, resistance

Digitized by Google

the arrangement of cells, energy and power, absolute and practical units, heating effects of current, thermo-couples, and the principles of electro-chemistry. The second half commences with the elementary laws of magnetism, and deals with electro-magnetic induction, alternating-current circuits, hysteresis, and eddy currents. At the end of the book is a chapter on "Networks," in which analytical methods of arriving at the voltage drop on interconnected conductors are given. The book is of American origin, and, consequently, wire sections are expressed in circular mils. In a future edition some mention of the various wire gauges would be of use to American as well as English readers. Graphical methods are intentionally avoided by the author, and this we consider to be a mistake. Diagrams and curves are also only very sparingly employed; thus, in the section on magnetisation and hysteresis we look in vain for the familiar B.H. curve which would convey so much more to the student than the equivalent tables which are given.

First Stage Sound, Light, and Heat. By R. W. Stewart. Second Edition. 288 pp. 6¾ in. by 4¾ in. 57 illustrations. (London: University Tutorial Press.) 2s.

THE present edition has been thoroughly revised and much has been rewritten, while a large number of new experiments and diagrams have been added. Though specially prepared for those studying for the science examinations of the Board of Education, the book forms a lucid introduction to the subjects dealt with, suitable for the use of schools or private students.

THE ASSOCIATION OF CONSULTING ENGINEERS

WE have received a communication from the Secretary of the above Association, setting forth the aims and objects in view of some misunderstanding on the subject which appears to have existed.

One of the principal objects of the Association is to secure that municipal and other public works shall be supervised by duly qualified consulting engineers. The Association will include all branches of the profession—civil, mechanical, electrical, gas, and possibly others—and it is proposed that every member shall be a properly trained and qualified engineer, and that he shall be acting solely in a professional capacity—that is, as a consulting engineer. It is not intended to encroach in any way on the authority of the councils of the leading institutions which deal with the different branches of engineering.

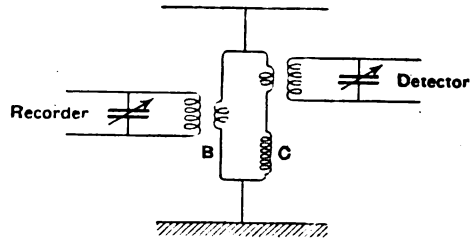
The Association does not propose to deal with science and problems of engineering, but only with professional status and conduct.

Although the bye-laws governing professional conduct issued by the Institution of Civil Engineers, and adopted by the Institution of Electrical Engineers, require that the members of these institutions, when acting in a "professional capacity"—that is, as consulting engineers—shall conform to certain rules, no distinction is made between their members, and are therefore not able to say to which of their members the rules are applicable. As the rules stand, a member can act in one capacity one day, and in another the next. The new Association adopts the view that there should be as clear a distinction between the work of a consulting engineer and that of other members of the engineering profession as there is between the work of a barrister and that of a solicitor in the legal profession.

The register of the Association will, it is hoped, form a complete list of the qualified consulting engineers to whom the professional conduct rules above referred to will be applicable at all times. This register will be open to inspection by the authorities responsible for spending public money, as well as to anyone else requiring the advice of a consulting engineer.

The rules of the Association are now under consideration, and will be based on the professional conduct rules of the institutions of Civil and of Electrical Engineers. These rules will be submitted to a general meeting in the autumn. It is hoped that all the leading men in the profession will be willing to give their advice and help, so that nothing may be done that would be detrimental to the interests of the existing institutions or of the public.

At present the membership is confined to those who are corporate members of the Institution of Civil Engineers and also of the Institution representing the particular branch of the profession in which they practice. It is hoped that all consulting engineers in sympathy with the objects of the Association will send their names to the Honorary Secretary, Mr. A. H. Dykes (1 Victoria Street, Westminster, S.W.), so that notice may be sent them of the general meeting which will be called in the autumn to consider and decide on the rules and constitution of the Association.



AN EXPERIMENT ON HARMONICS IN RADIOTELEGRAPHY

By C. C. F. Monckton

AT a station A, 60 miles from B and about 35 miles from C, an attempt was made to receive signals from both stations simultaneously on the same aerial. B was sending with 50 watts, C with from 1 to 3 kilowatts. The receiving circuits were in tune and arranged as in the accompanying figure.

The following points were noted:—(1) No signals could be received from station C if the B circuit were completed. (2) Closing the C circuit, no difference was made to the B signals. (3) Using a closer coupling, C signals could be received in B when C was open or closed. (4) The wave-length of C was double that of B within 10 per cent.

A further experiment was made. A single receiving circuit was used with three turns of inductance 22·7 cms. diameter as the primary, and 44 double turns of 19/0·005 mils. wire on a 15·4 cms. diameter bobbin as the secondary of a transformer. The

primary and secondary were both tuned to half the wave-length of C. Readable signals were obtained from C with the coils separated 8 cms. centre to centre, using the silicon detector; no signals were received if the capacity were increased or diminished by about 0·0001 mf. Then keeping the primary circuit the same, the capacity was increased fourfold to make the secondary in tune with C; readable signals were obtained with the coils 10 cms. apart centre to centre; the signals were lost if the capacity were increased or decreased 0·00006 mf.

Finally, altering the primary to tune C by adding inductance, and the secondary to tune B, the coils had to be brought as close together as possible for signals to be received from C. Increasing the capacity, the signals gradually became louder till the secondary was in tune with C.

Automatic Telephone Exchange.—According to a British Consular Report, the year's trial made in Lyons, France, of the Lorimer automatic telephone exchange, was completed in the autumn of 1909, and was very successful. It is stated, however, to be doubtful whether the French postal authorities will take up the invention, partly on account of its complicated, delicate, and costly nature, and partly also on account of the wholesale dismissal of telephone operators which the general adoption of the system would entail.

The Summer Meeting of the Institution of Mechanical Engineers.—On page 508 of ELECTRICAL ENGINEERING of last week, in our special report of the discussion on the electric traction Papers read at the combined meeting of the Institution of Mechanical Engineers and the American Society of Mechanical Engineers, Mr. J. G. Wilson was described by an error of our reporter as being connected with the Great Eastern Railway. This is not so, as the Mr. Wilson who spoke belongs to the firm of Merz & McLellan, consulting engineers, of Newcastle and London.

Electricity Supply in Austria.—The Elektrotechnischer Verein in Wien (Electrotechnical Society of Vienna) have issued a 32-page brochure giving full particulars of electricity supply in Austria. The list includes 675 stations supplying over 1,500 districts, and is corrected up to July 1st last. Among the details given are the number of inhabitants of the place in question, the owner of the supply system, date of commencement of supply, nature of supply, pressure, frequency, capacity of lamps and motors connected, charges, and output. Of the 675 stations, 241 are under municipal control, and the remaining 434 are owned by private concerns. Of the latter, 114 are works in connection with large factories, works, or mines. The continuous-current stations number 403; single-phase, 15; two-phase, 5; three-phase, 192; both continuous-current and three-phase, 37. Particulars are failing in the case of the remaining 23 stations. There are 10 stations of over 5,000-kw. capacity, and 89 of between 500 and 5,000 kw. Steam stations number only 127. There are 308 water-power stations, 52 gas and oil engine stations, 87 steam and water, 15 steam and gas engine, 42 water-power and gas engine.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Aug. 4th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

16,547/09. **Electric Heater for Liquids.** Dr. F. W. Forbes Ross (London). Nickel or other resistance wire is wound on a grooved core of porcelain, and enclosed in a closely fitting quartz tube. Before fitting on the tube, the grooves are filled up with plaster of Paris or a phosphate or silicate cement. The space between the core and the outer tube is thus filled up with paste, and this facilitates the transfer of heat from the wire to the liquid. The wire is heated before the paste sets, so that it makes a channel large enough for itself to expand in. One figure.

16,682/09. **Tramcar Trolley Head.** F. Jackson (Ashton-under-Lyne). A construction of ball race previously used for pulley blocks is applied to trolley heads. The trolley wheel is bored slightly taper, and is fitted with a bush, on each side of which is a ball race. The balls are retained in position by cones inserted in the bush and screwed on to the central bolt passing through the wheel. Two figures.

20,586/09. **Electrical Marine Propulsion.** J. N. Bailey (Stretford). In a system comprising a turbo-alternator and a motor driving the propeller shaft, speed variation is obtained by controlling the admission of steam to the turbine. A special form of controller is used, and on going from one step to a step of lower speed, steam is temporarily cut off and water is automatically admitted to a hydraulic friction brake on the turbine shaft. This slows down the turbine quickly. An alternative method of braking consists in temporarily admitting water to a water resistance permanently connected to the generator. Four figures.

20,786/09. **Switchgear.** C. B. Walker (Solihull, Warwick). This is a quick-break mechanism suitable for automatic battery regulators and slow-speed gear for heavy motor starters. The contact arm is attached to a worm wheel which gears with a worm. The wheel is held from rotating by a catch, and instead of moving the wheel, the worm, on being rotated, slides along its axis and compresses a spring. When a certain point is reached, the catch is released and the spring causes the worm to slide back and move the contact arm quickly one step on. The slow rotation of the worm ensures that the contact arm shall remain stationary a considerable time on each step. Two figures.

23,225/09. **Commutator Segment Insulation.** British Thomson-Houston Co. *(General Electric Co., U.S.A.)*. An insulating material which will wear down evenly with the segments is composed of 237 parts of dry Kaolin, 37 parts powdered glass, 88 parts green silko, 2 parts red silko, and 156 parts asbestos. The mixture is made into sheets, treated with silicate of soda, and finally fired at a high temperature under considerable pressure. The compound is stated to have high dielectric and mechanical strengths, and to withstand high temperatures

3,733/10. **Alkaline Accumulator.** L. Marseille and P. Gouin (Paris). When forming electrodes with hydroxides of nickel, considerable expansion occurs. To avoid distortion, the electrode consists of a cylindrical tube of nickel perforated and bound all over with wire. This tube is then oxidised, so as to fill the insterstices of the binding with sesquinoxide of nickel. Finally, it is filled with the active material and closed at both ends with ebonite plugs. Five figures.

4,697/10. **Motor Control.** H. E. White and E. R. Carichoff. (Schenectady.) In electromagnetic control systems as used with traction motors, auxiliary electromagnetic switches controlled by the motor current are mechanically interlocked with the successive resistance controlling contactor switches in the control circuit, so that if the master controller is moved to the next position, the corresponding contractor will not work until the motor current has fallen to a predetermined value. One figure.

6,658/10. **Supports for Metal Filaments.** Dr. F. Salzer (Ujpest, Hungary). In order to protect the metal supports or leading-in wires from the effects of the high temperature of the filament, the former are coated electrolytically with a thin film of chromium. The coated wires are heated to anneal the coating and render it flexible.

10,817/10. **Wireless Telegraphy.** R. A. Fessenden (Brant Rock, U.S.A.). On warships where the apparatus is placed below the protective deck, it has been found that the proximity of the steel plates to the aerial leads weakens the signals. To overcome this objection, the leads are surrounded by a cage of copper wires, where they pass through the protective deck. The cage is connected to the copper sheathing on the outside of the vessel. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Dalziel's Constant Voltage Patents, Ltd., and Dalziel [Distribution system] 16,645/09; Beaver and Claremont [Cable joints] 20,106/09.

Dynamos, Motors, and Transformers: Boult *(Deutsche Elektro Sparlicht Ges.)* [Transformers] 17,043/09; Siemens Bros. Dynamo Works, Ltd. *(Siemens Schuckertwerke Ges.)* [Frequency changers with commutators] 24,269/09; Schlick [Generator for bicycle lamps] 5,043/10; Siemens Bros. Dynamo Works, Ltd. *(Siemens Schuckertwerke Ges.)* [Frequency changers] 7,292/10.

Instruments and Meters: Berry, Russell and Jung [Speed recorder] 11,515/09; Rennie [Speed indicator] 16,621/09; Palmer [Prepayment meters] 10,802/10.

Storage Batteries: Garde and Adams [Plates] 9,066/09; Taylor [Charging methods] 14,212/09.

Switchgear, Fuses, and Fittings: British Thomson-Houston Co. and Wedmore [Protective devices] 17,031/09; Arnold [Lampshade holders] 20,666/09; Adams Manufacturing Co. *(Cutler Hammer Manufacturing Co., U.S.A.)* [Electromagnetically worked switches] 5,801/10.

Telephony and Telegraphy: Lake *(Electric Press Bulletin Co.)* [Telegraphic apparatus] 23,328/09.

Traction: Pink [Traction system] 18,499/09; Perraud [Automatic stopping of trains] 24,015/09; Heizer [Air brakes] 25,870/09; Wheless [Rails] 29,763/09; Roberts [Rail-joints] 4,762/10; Soc. in Accomandita per l'Utilizazione delle Invenzioni Ing. Beer [Signalling] 11,358/10; Walter's Electrical Manufacturing Co., and Moore [Signalling] 15,882/10.

Miscellaneous: Burks [Combined massaging and magneto machine] 16,405/09; Hirst [Coal-cutter] 17,235/09; Whipple [Tyre-pump] 17,414/09; Thompson *(Hamburger Elektricitats Ges.)* [Illuminated signs] 19,623/09; Knight [Fire-alarm] 22,378/09; Siemens Bros. Dynamo Works, Ltd. *(Siemens Schuckertwerke Ges.)* [Flexible couplings] 28,019/09; British Thomson-Houston Co., Ltd. *(General Electric Co., U.S.A.)* [Treatment of metals of chromium group] 3,981/10; Fairburn-Hart *(Electric Renovator Manufacturing Co.)* [Centrifugal fans] 5,376/10; Freise [Selenium cell fire-damp indicator] 9,545/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: A.-G. Brown, Boveri et Cie. [Voltage regulation of A.-C. machines] 15,415/10.

Electrochemistry: Billiter [Electrolysis] 11,693/10.

Miscellaneous: Maschinenfabrik Oerlikon [Driving of ring-spinning machines] 2,237/10; Maloney [Mono-rail cars] 17,075/10.

Opposition to Grant of Patents

9,110/09. **Boilers.** W. Wallis. This patent has been granted in spite of opposition. It covers the use of a series of short curved deflecting plates near the surface of the water to promote circulation.

15,496/09. **Metal Filaments.** R. Jahoda. Opposition has been entered to the grant of this patent, which covers the use of copper and silver oxides in the manufacture of metal filaments. (*See* Electrical Engineering, June 23rd, 1910, page 415.).

15,659/09. **Centrifugal Fan.** K. Maxaner. The grant of this patent has been allowed in spite of opposition. The specification was abstracted in Electrical Engineering, April 21st, 1910, p. 274.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: W. S. Weedon [Titanium oxide electrodes] 9,190/04.

Distribution Systems, &c.: E. Claremont and C. J. Beaver [Cable braiding] 8,810/03.

Dynamos, &c.: H. Chitty [Ventilation of field magnets] 9,397/02; H. Leitner [Train-lighting system] 8,812/05; British Thomson-Houston Co. and F. Holden [Train-lighting dynamo gear] 8,570/05.

Incandescent Lamps: British Thomson-Houston Co. *(General Electric Co., U.S.A.)* [Machine for capping bulbs] 8,568/05.

Switchgear, &c.: C. J. Klein [Push-button switch] 8,910/04; W. H. Lau [Lamp-holder] 8,253/05.

Telephony, &c.: S. G. Brown [Quadruplex telegraphy] 7,471/00.

Miscellaneous: A. F. Berry and R. J. Wallis-Jones [Electric welder with transformer] 8,340/99; G. C. Lilley [Mariners' compass] 9,178/02.

Digitized by Google

THE WIRING CONTRACTORS' POINT OF VIEW

THERE are three topics of conversation among wiring contractors, and in all three cases they give rise to a certain amount of speculation. By the word speculation we do not mean "the laying out of money with a view to more than the usual success in trade," nor do we mean "a hazardous commercial or business transaction entered into in the hope of large profits," both of which are excellent dictionary definitions; we are using the term in what we believe to be its original meaning. Wiring contractors are speculating—or, let us say, wondering—what are the precise arrangements that have been come to by the tube makers who have formed a "ring," or, more than a ring, an "Electrical Conduit and Fittings Association." They are wondering what is precisely the position of the wiring contractor in the patent fight between the metal filament lamp makers and importers. Lastly, they are wondering whether Parliament will grant the general wiring powers to Local Authorities, which it has sometimes refused and sometimes granted in the special cases that have arisen hitherto.

The Incorporated Municipal Electrical Association has lost little time in circularising its members to enquire whether they would support a general Bill to give full powers to Local Authorities to carry on house-wiring. The proposition has already been considered by a few municipal councils, with varying results, as reported in our last issue. Among those who decided to support the Bill were the Dundee Council, but last week the Council received a deputation of Dundee wiring contractors, who placed before them their point of view, and after some discussion the matter was remitted for further consideration by 12 votes to 10.

The pending patent action by the Osram lamp people against Messrs. G. M. Boddy & Co., one of the importers of Philips lamps, will have one good effect in "clearing the air." Some surprise is expressed, however, that, with, we believe, only one exception, no other lamp makers or importers have replied to the public announcement made by the General Electric Co. and the B. T.-H. Co. with regard to this matter. The wiring contractor and his customer want to know what liability they incur by selling and purchasing lamps alleged to be infringements of the Osram group of patents, and the consulting engineer who has large consumers of lamps to advise, and the municipal electrical engineer who buys for street lighting, also desire similar information. If it is not forthcoming it is obvious that several customers of the smaller lamp makers and suppliers will be transferring their patronage to the Osram and Mazda.

The "Electrical Conduit and Fittings Association" is apparently a combination to level up prices of conduit for electrical purposes—we say advisedly level up and not level down. So far as we have been able to ascertain, practically all the interior electrical conduit firms have joined the Association, and prices have been agreed upon which represent a considerable advance in the case of the cheaper firms and those who have been cutting prices hitherto, but leave the list prices and discounts of the larger firms practically unchanged. It remains to be seen whether the new Association will endure, as has been the case of the Cable Makers' Association, or whether it is to be regarded merely as a temporary measure to prevent further price cutting. It is already causing some loss to contractors who have tendered for work on the basis of the lower prices of conduit and have now to buy at the top prices.

Parliamentary Intelligence.—Among the Bills to which Royal Assent was given last Wednesday were the following:—Eastbourne Corporation, London County Council (Tramways and Improvements), London United Tramways, Rhondda Urban District Council (Tramway Extensions, &c.), Electric Lighting Order Confirmation (Nos. 1, 2, and 4), Tramway Order Confirmation, Metropolitan District Railway.

Hysteresis in Iron and Steel.—A Paper on "Hysteresis Loops and Lissajous' Figures, and on the Energy Wasted in a Hysteresis Loop," was read by Prof. S. P. Thompson at a recent meeting of the Physical Society of London. Explanations of the forms of the looped curves which express the hysteresis exhibited by iron and steel have been given by Ewing and Hopkinson, and M. Pierre Weiss has put forward an electronic theory. Prof. Thompson shows that any hysteresis loop can be analysed into a harmonic series of closed curves corresponding to the various terms in the analysis of the current wave. A number of examples of hysteresis loops were chosen and subjected to analysis. These related to various kinds of iron and steel, hard and soft, solid and laminated. Details are given of the analysis of various loops, the effect of eddy currents on the size and form of the loops is discussed, and an account is given of the effect of the higher sine and cosine constituents of the current wave.

THE A.E.G. AND THE LAHMEYER CO.

Concentration of Interests

THE *Frankfurter Zeitung* aroused considerable interest on July 30th by predicting a combination of interests between the A.E.G. Co. and the Felten & Guilleaume-Lahmeyerwerke. That this prediction was based on good information is now proved by the announcement that an important agreement has been arrived at between the Elektricitäts-A.-G. (*vorm* W. Lahmeyer & Co.), Frankfort, and the Bank für elektrische Unternehmungen, Zürich, whereby shareholders in the Lahmeyer Co. are to receive new shares in the banking company to the face value of 3,000 francs in exchange for every 4,000 marks of shares of the Lahmeyer concern. The exchange has yet to receive the sanction of the shareholders of the Lahmeyer Co., and an extraordinary general meeting will be held on August 23rd, but it is considered certain that the arrangement will be agreed to. The importance of the agreement is due to the fact that the Bank für elektrische Unternehmungen is practically controlled by the Allgemeine Elektricitäts Gesellschaft, of Berlin, who own most of the shares, and that the Elektricitäts-A.-G., *vorm* W. Lahmeyer & Co., holds 16 million marks of the 55 million marks which is the total capital of the Felten & Guilleaume Lahmeyer Werke combination. The capital of the Bank is 40 million francs, and it has acted as a holding company for the various shares in the companies acquired by the A.E.G. in the course of their business. The capital of the W. Lahmeyer Co. is 25 million marks. Further, it is asserted that there has been for some time past a friendly understanding between the Allgemeine Elektricitäts Gesellschaft and the Siemens Schuckert group, so that a general concentration of interests is predicted with a view to eliminate wasteful competition. The competition of recent years is said to have been considerably increased by the rapid growth of the Bergmann Elektricitäts Gesellschaft of Berlin.

Telegraph Traffic.—On the 3rd inst., the cable between Bonny and Duala ceased working, while on the 8th inst. the line between Rome and Constantinople was down. The Western Union Telegraph Co. are now busily finishing their new Atlantic cable, the c.s. *Telconia* having laid the shore end at Bay Roberts, Newfoundland. The Direct United States Cable Co.'s deep-sea sections to connect their existing cable with Newfoundland (Harbour Grace) will also soon have been laid.

Wireless Telegraphy.—In connection with the manœuvres of the Territorial forces, a wireless company of the Northern Engineers is stationed near the Western Camp at Aldershot, and is provided with up-to-date portable apparatus, with a forty-foot aerial. At Bexhill, a wireless company of the Royal Engineers are using telegraph poles as masts from which to hang their aerials.

The City of Dublin Steam Packet Co. has made arrangements with the Marconi Co. for fitting the mail packets with wireless apparatus. The R.M.S. *Connaught* has already been fitted.

According to the *Times*, the Glasgow Chamber of Commerce on Monday agreed unanimously to oppose the Wireless Telegraphy Bill. Mr. Robert Henderson, of the Anchor Line, representing the Glasgow Steamship Owners' Association, stated that the Bill was uncalled for unless where vessels carried over 100 passengers, exclusive of crew. To compel vessels carrying only 50 passengers, inclusive of crew, to carry the apparatus would place a great hardship upon purely cargo ships. The Bill seemed in the interest merely of wireless telegraphy companies, who would make the utmost use of the monopoly thus afforded them.

Wireless Telegraph Detectors.—A Paper entitled "The Energy Relations of Certain Detectors used in Wireless Telegraphy" has been contributed to the Physical Society of London by Dr. W. H. Eccles. The paper gives the results of experiments on the electrolytic detector, the zincite rectifier, the carborundum rectifier, and a thermoelectric detector consisting of a light contact between graphite and galena. The quantities of energy given in the form of electrical oscillations were the same as in actual practice. Three ways of investigation were followed. The first way consists in applying to the detector an electromotive force which is gradually increased, and measuring the current at each step. The second way is to fix the electromotive force at some particular value, to send trains of oscillations of various energy values through the instrument, and to measure the intensity of the sound produced in the telephone on each occasion. The third way is to send trains of constant energy value through the instrument while the steady electromotive applied to it is varied, and to measure at each step the intensity of the sound produced in the telephone. The results suggest that all the detectors are fundamentally thermal in their action.

Digitized by Google

LOCAL NOTES

Aberdeen: *Tramway Accounts.*—The result of the year's working is a balance of £14,634, which has been transferred to renewal account. The consumption of electrical energy has decreased since ampere-hour meters have been fitted to the cars, and is now 1·102 unit per car-mile, a reduction of 0·146 unit since 1906, although more top-covered cars are in use.

Auckland (New Zealand): *Tramway Brakes.*—According to the *Australian Mining Standard*, a Royal Commission which has inquired into the tramway undertaking recommends the adoption of compressed air brakes and sanding gear, and the reconstruction of the existing track brakes so that 45 per cent. of the weight of the car can be transferred to the blocks.

Belfast: *Tramway Extension.*—At the monthly meeting of the Corporation last week the proposed tramway extensions in various portions of the city which have been discussed by the Council in Committee were approved. The extension scheme consists of eight different extensions within the city, at a probable cost of £111,000, and also a new line of tramway to M'Art's Fort, on the top of the Cave Hill, which, it is estimated, will cost £130,000.

Chatham: *Lighting of Corporation Buildings.*—With reference to a proposed increased charge for current by the local company, the Town Council are to obtain an estimate for lighting the whole of the corporation buildings with gas, and also are to have a report prepared as to the advisability of the corporation generating their own electricity for lighting the Town Hall.

Chelmsford: *Street Lighting.*—The Council have received tenders from the Electric Supply Corporation for street lighting at the following prices:—Twenty-one flame arc lamps at £25 5s. each per annum, and twenty-three 200 c.p. and 280 100 c.p. and certain other incandescent lamps at £3 3s. per annum. The gas companies submitted several alternative tenders for lamps from 75 to 125 c.p. at prices from £3 to £3 4s. 6d. per annum.

Cleckheaton: *Tramways.*—The Board of Trade have decided to issue an order granting to the British Electric Traction Co. a cessor of powers with reference to the unconstructed portions of the Spen Valley lines, so that the projected line from Cleckheaton to Hartshead Moor will be abandoned.

Finchley: *Showroom.*—A small showroom at the electricity works is to be equipped with cooking, heating, and other apparatus for demonstrations.

Glasgow: *New Type of Tramcar.*—A new type of small single-deck car, in which one official will be able to act both as driver and conductor, is to be put into use between Finnieston and Stobcross.

Greenock: *Electricity Accounts.*—The profit on the year's working has amounted to £3,247, of which £1,000 has been carried to reserve, while the remainder is to be applied to relief of rates.

Halifax: *Tramway Accounts.*—The total revenue for the past year is given as £89,270, and the working expenses as £53,898. After meeting capital charges the net profit is £13,065, against a loss of about the same figure for the previous year.

Herne Bay: *Electrically-caused Fire.*—An outbreak of fire due to the fusing of a lighting cable took place at the new pier pavilion on Thursday evening, but very little damage was done.

Ilford: *Electricity Accounts.*—The electricity accounts for the year to March 31st show a net profit of £1,569 after meeting capital charges, compared with a profit of £1 in the previous year. The average price obtained per unit sold for private supply increased from 2·15d. to 2·55d., and for public lighting from 1·66d. to 1·98d.

Llanelly: *Tramways.*—The Board of Trade have confirmed the Llanelly & District Light Railway (Renewal and Extension of Time) Order, 1910, renewing the powers and extending the periods for the completion of light railways.

London: *Hornsey: Dispute with the North Metropolitan Electric Power Co.*—The Council have decided to take counsel's opinion regarding their complaint that the North Metropolitan Electric Power Co. have acted *ultra vires* in supplying a cinematograph theatre in Frobisher Road.

Nelson: *Lighting of Brierfield.*—A letter was read to Nelson Town Council from the Brierfield Authority on August 4th with regard to the supply of electricity in their district for lighting and motive power, and suggesting a limited term of 3¾ years. The suggestion was accepted, and an agreement was authorised for the supply of electricity in bulk until March 31st, 1914. Application is now to be made to the Board of Trade for an order authorising the supply.

Peterborough: *Electricity Accounts.*—The accounts for the year ended March 31st show a deficit on the year's working of £1,801. Included among the expenses of the year were £1,016, costs of an arbitration case with a traction company.

Plymouth: *Motor Hire.*—The Electrical Engineer having been instructed to report as to arranging for the letting of electric motors on hire, informed his Committee that at the present time the Corporation do not possess the requisite statutory powers.

Rochdale: *Electricity Accounts.*—The accounts of the Electricity Department for the year to March 31st show a net profit of £5,171 after meeting capital charges. The number of units sold was 3,545,339, and is a substantial increase over the figure for the previous year, due to the extra energy supplied for power purposes. In 1909 the Council passed a resolution that an amount equal to 1 per cent. of the capital charges should be charged to revenue account for depreciation, and this has been done. In view of the satisfactory condition of the undertaking, there is a possibility that the Committee will reduce the prices for energy, although there may be some doubt as to this in view of the fact that coal is likely to increase in price, and that all additional power units sold tend to reduce the average income per unit.

Sheffield: *New Tariff.*—The Electricity Committee has framed the following conditions with regard to discounts to lighting consumers:—(1) To any consumer who uses electricity for lighting purposes as much as possible throughout the year during daylight or long hours, mostly when the output is not at its maximum, and provided that the consumption, based on the estimated maximum demand, does not fall below 100 units per annum per 60-watt lamp or equivalent, a discount of 50 per cent. will be allowed from the usual price of 4d. per unit. (2) Accounts will be rendered weekly, monthly, or quarterly, at the option of the Committee, and the discounts will be adjusted according to the average daily rate of consumption as shown between successive readings. (3) No discount will be allowed unless the account is paid before the next account is due. (4) The Committee may, in special cases where they deem it an advantage so to do, make such terms as they think fit, provided that in any such case similar terms shall be allowed to other customers in similar circumstances as required by the provisions of "The Electric Lighting Act, 1882."

South Shields: *Electricity Accounts.*—The electricity undertaking, which, for nine years, had been producing a profit, has an adverse balance of £106 on the last year's working. It is stated that the introduction of the metal filament lamp has caused a serious diminution in revenue.

Stafford: *Electricity Accounts.*—The total expenditure for the year was £1,865, and the revenue was £4,344. After meeting capital charges, the net profit was £374, and £110 was brought forward from last year; £340 is to be transferred to depreciation, and the remainder carried forward.

Stockport: *Tramway Accounts.*—A balance of £5,000 has been contributed in aid of the rates.

Strood: *Order Revoked.*—The Board of Trade has revoked the Strood & Dartford Electric Lighting Order.

Wigan: *Extensions to Electricity Works.*—The foundation stone of the extensions to the Electricity Works was laid on Wednesday of last week. The cost of the extensions will be £36,000.

Wolverhampton: *Tramway Accounts.*—The past year's working of the tramways, which are upon the Lorain surface-contact system, has resulted in a net profit, after meeting capital charges, of £5,667.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Accrington.—The Electricity Committee have decided upon the purchase of a new battery, which is to be paid for out of revenue. It is the intention to use the old boxes and the present battery.

Australia: *Melbourne.*—Tenders are required for 4,840 yards of low-tension lead-covered cable, and 880 yards of

Digitized by Google

high-tension concentric cable. Tenders by August 23rd. Particulars from Messrs. McIlwraith, McEacharn & Co. Ppty., Ltd., Billiter Square Buildings, London, E.C.

BOURNEMOUTH.—Tenders are invited for the reconstruction of 2½ miles of permanent way and the supply of 450 tons of rails. Tenders by August 31st, and particulars from the General Manager.

DUBLIN.—Considerable mains extensions are to be proceeded with at a cost of £2,350. The South Dublin Union have received sanction for a loan for an electric light installation.

ECCLES.—As an additional switch panel will be required in connection with a new H.T. feeder about to be laid from the electricity works to Monton Green, the Electrical Engineer has been authorised to inspect the Ferranti switchboard at the Hastings Electricity Works. The Local Government Board has sanctioned the borrowing of £1,927 for the extensions of the engine-room and additional generating plant, and £1,307 for main extensions.

FLEETWOOD.—A Local Government Board inquiry was held at Fleetwood on August 4th into an application by the Fleetwood Council to borrow £4,100 for the purpose of the electricity undertaking. The proposed extension comprises a 800 kw. steam dynamo (£1,700), switchboard (£560), an overhead crane (£135), extension of building (£1,120), and contingencies.

HEREFORD.—The Local Government Board have sanctioned loans of £2,000 for mains and £1,500 for services.

LEICESTER.—A Local Government Board enquiry was held last week concerning a loan of £19,190 for additional generating plant at the Tramways Power Station. The Corporation have two power stations. One will supply alternating current, and is used for lighting almost exclusively, and the tramway power station, which also distributes continuous current, for power purposes. It is now proposed to work the two stations in conjunction with each other, although the loan in question is not affected by any arrangement which may be come to between the Tramways and Lighting Committees.

ROCHDALE.—Tenders are invited for the supply and delivery of paper insulated cables during a period of twelve months. (See advertisement on another page.)

RUSSIA.—The Riga Telephone Co. plans the following long-distance telephone lines: 100 miles to Pernau, 160 miles to Riga-Dorpath, and 142 miles to Riga-Fellin. The Russian Government proposes to build wireless stations at the port of Libau, at Bolderaa (mouth of the Dvina), and on Runo Island (Gulf of Riga). New electric power stations are contemplated for Novgorod; Kupyank, in the Government of Kharkov; Roono, in the Government of Volhynia; and Karassubarar in the Government of Tabriz; Alexandroosk-Gruschersk; and Kharbin. The following undertakings are either decided upon or are projected: Hennitchesk, electric lighting; Kiev, extension of electric lighting; Tchernigoff, telephone system; Orgieff, electric lighting; Rostov-on-the-Don, power station; Simferopol, electric tramways; Abashukino (in the Caucasus), hydro-electric station: Vladivostok, central power station; Novo-Nikolaievsk, electric lighting; Minsk, electric traction for tramways; Tiflis, electric railway along Mount St. David, and several other works in the district; Piatigorsk, electric power station; Romaninsk (Caucasian oil fields), power station; Poltava, electric tramways. The St. Petersburg Central Telephone Administration has obtained permission from the municipal authorities to use £285,000 in extending the telephone system and enlarging the central exchange so as eventually to serve 34,000 subscribers. The administration desires to arrange for an eventual 45,000 subscribers, and has asked that the amount be increased to £485,000. If Moscow can secure a loan of £2,470,000, the town council will expend £1,050,000 on the tramway system.

STRETFORD.—The Resident Engineer is to prepare a specification for the switchboard connection to the battery.

WIMBLEDON.—The Local Government Board has sanctioned the borrowing by the Council of the following amounts:—£3,400 for mains; £1,600 for house services; and £1,600 for meters.

MISCELLANEOUS

AUSTRALIA: *Victoria.*—Tenders are required for telegraph and telephone material to various specifications by August 30th, September 13th and 20th, and October 4th; also for electric lamps. Particulars from office of Commonwealth High Commissioner in London.

New South Wales.—Tenders are required by October 5th for 5,000 insulators. Particulars from Departmental Stores, 170 Clarence Street, Sydney.

AUSTRIA-HUNGARY.—According to the *Board of Trade Journal*, tenders will be received up to October 1st by the Municipal Authorities of Mostar for plant for the supply of electricity to the town.

BARCELONA.—A concession has been granted to the "Sociedad Anónima Los Tranvías de Barcelona" for extensions.

EGYPT.—Tenders are invited for an electrical installation at an asylum at Khanka. Particulars from Mr. A. L. Webb, Queen Anne's Chambers, S.W.

KIRKCALDY.—Tenders are invited for tramway material by August 24th. Particulars from S. L. Lumsden, Burgh Surveyor, Tolbooth Street.

LONDON: *Poplar.*—The Board of Guardians invite tenders for general stores for twelve months, including electrical supplies. Particulars from the Clerk to the Guardians, 45 Upper North Street, Poplar, and tenders by August 13th.

RAINHILL.—Tenders are required for a complete telephone installation for the County Asylum by August 25th. Particulars from J. Gornall, Clerk's House, County Asylum.

SKIPTON.—Tenders are invited for a gas engine and dynamo, and for the wiring of the Town Hall. Tenders by August 17th, and particulars from R. Wilson, Clerk to the Council.

TORQUAY.—The Borough Surveyor has been asked to prepare a scheme for the illumination of the Princes Gardens by electricity.

WEYMOUTH.—A loan of £150 has been sanctioned for tools at the Electricity Works.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

N.—Church and Schools, Wightman Road, North Harringay. Architect, Edgar Harry Selby, 8 Buckingham Street, W.C.

S.W.—Electric Theatre, Balham. Surveyors, Williams & Williams, 151 Regent Street, W.

PROVINCES.

ASHTON-UNDER-LYNE.—Savings Bank (£3,160). Architects, W. H. George & Sons, 7 Warrington St., Ashton-under-Lyne. Builders, Saxon Bros., Stalybridge.

BESWICK.—School, Gibbon Street (£6,684). J. H. Reynolds and C. H. Wyatt, Joint Secretaries, Education Committee, Manchester Town Council.

BOGNOR (SUSSEX).—Congregational Sunday Schools (£1,660). Architect, E. J. Hamilton, Brighton. Builders, J. Lingfield & Sons, Littlehampton.

BOLTON.—Training College (£3,660). F. Wilkinson, Secretary, Education Committee, Town Council.

BURTON.—Electric Theatre. Architect, T. Jenkins, Arcade Buildings, Station Street, Burton-on-Trent.

CHESTER.—Fire station (£3,000). Architect, G. Strong, Liverpool. Builders, J. Meyers & Co., Canal Side, Chester.

CREWE.—School, Derby Street (£12,000). Architect, G. Eaton Shore, Council Offices, Crewe.

ECCLES.—Baths, Cromwell Road. Surveyor, Eccles Town Council.

EDINBURGH.—Additions, George Watson's Ladies' College (£12.000). Architect, G. Washington Browne, 8 Allyn Place, Edinburgh.

FENCE HOUSES.—School (£11,875). J. A. L. Robson and J. L. Dawson, Joint Secretaries, Durham County Council, Education Committee, Durham.

FOLKESTONE.—Additions, Corporation Offices (£234). Builder, Otto Marx, c/o Surveyor, Folkestone Town Council.

LINCOLN.—Proposed Carnegie library (£10.000). R. A. MacBrair, Surveyor, Town Council.

MANCHESTER.—Governesses' institution (£4,262), Upper Brook Street, High Street. The Governors.

PUDSEY.—Extensions Town Hall (£3,500). Architects, J. Kendall & Son, 26 Lowtown, Pudsey.

RENFREW.—Masonic hall (£3,000). Architects, J. Boyd & Co., 49 Bath Street, Glasgow.

RUGBY.—Palace Theatre (£4,344). Builder, C. Cockerill, Rugby.

RYHILL.—School (£4.500). W. V. Dixon, Secretary, Education Committee, West Riding of Yorks County Council, Wakefield.

SALFORD.—School (£14.000). O. Duthree, Secretary, Education Committee, Salford Town Council.

WIGAN.—School (£8.000). Architects, F. & W. Thornley, Library Street, Wigan.

British Association.—The Australian Government will invite the British Association to meet in Australia in 1913 or 1914. Meetings in all the State capitals are contemplated, and the Australian Parliament will be asked to vote £10.000 to defray expenses connected with the visit.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

AUSTRALIA: *New South Wales.*—The tender of J. Paton (Sydney) for 6,000 wall telephones (£15,600) has been accepted.

Western Australia.—The tender of the Western Electric Co. for 1,200 telephone wall sets (£3,120) has been accepted.

BRIDLINGTON.—The tender of the British Westinghouse Co. for the supply of metal filament lamps has been accepted.

BURY.—The tender of Messrs. Siemens Bros. & Co., for extra high-tension trunk mains to be laid from the new power station to the present electricity works, has been accepted.

DELAGOA BAY.—The Chloride Electrical Storage Co., Ltd., are supplying a battery and Entz booster equipment.

ECCLES.—The Council have accepted the tender of E. M. Evans & Sons, Manchester, at £460 9s. 6d., for the electrical wiring and fittings for the proposed new secondary school.

FAREHAM.—The Asylums Committee of the Southampton County Council have accepted the tender of Shalders & Davis, Southampton, for electrical machinery at £1,715.

FOLKESTONE.—The tender of E. Morgan at £69 15s. for supplying and fixing electric fittings at the Corporation Offices has been accepted.

GRIMSBY.—The Council have accepted the tender of Accumulator Industries, Ltd., for the supply of metal filament lamps for street lighting; and the tender of E. A. Hall for fixing two 18-in. fans in the Council Chamber at £20 2s. 6d.

IRELAND (BALLYCLARE).—The tender of Messrs. Curran Bros. has been accepted for an electric lighting installation at Ballyclare. The contractors have promised the Council to have the plant in working order for the winter.

LEITH.—The tender of the British Westinghouse Co. for a mixed-pressure continuous-current turbo-generator and accessories (£4,775) has been accepted.

MANCHESTER.—The Council have accepted the tender of the Union Cable Co., Ltd., for service cables at £1,500. At the meeting on August 3rd objection was raised to the order going to a foreign firm. The Chairman of the Electricity Committee (Mr. Howarth) said the lowest British tender was £2,750. The undertaking had suffered in the past from the Cable Makers' Association. The Union Cable Co., it was said, are about to build a factory at Dagenham, in Essex. An amendment to refer the matter back to the Committee was negatived.

ROTHERHAM.—The tender of Hall & Matthews for electric wiring at the South Grove Higher Standard School at £117 has been accepted.

SHEFFIELD.—The Town Council has accepted the following tenders:—British Insulated & Helsby Cables, Ltd., two miles of figure 8 bronze trolley-wire, 8½d. per pound, less 2½ per cent.; W. T. Glover & Co., Ltd., ten tons of H.C. copper wire to be made up into cables during a period of two years.

STRETFORD.—The tender of the Tudor Accumulator Co. for alteration and extension of the existing battery at £784.

TORQUAY.—An order has been placed with Ferranti, Ltd., for the annual supply of meters at £1 6s. 6d. each, for the smaller sizes, this price to include all ordinary repairs and adjustments.

WALSALL.—The Town Council has accepted the following tenders:—H. G. Richardson & Co., providing low-tension switchboard and altering a switchboard, £88 10s.; Union Electric Co., Ltd., three high-tension isolation switches, £19 10s.

WARRINGTON.—The tenders of George Wallington for laying down concrete foundations for the turbo-alternator and condensing plant, and the erection of a building for switchboard extensions at £300 have been accepted.

The Synchronome Co. (32 Clerkenwell Road, London, E.C.) are now installing their system of electrical impulse dials in a number of buildings, including the Transvaal Government Offices, Pretoria; the Transvaal University, Johannesburg; the Royal Courts of Justice, Rangoon; the locomotive workshops of the Manchurian Railway at Shakako; several offices and the Eastleigh works of the London & South Western Railway. The company are also exhibiting at Brussels, and will instal the system in the Royal Palace at Laeken.

APPOINTMENTS AND PERSONAL NOTES

Mr. P. M. Hampshire, assistant in the physics and engineering department at Blackburn Municipal Technical School, has been appointed lecturer and practical instructor of engineering subjects at the Municipal Institute, Walsall, at a salary of £160 per annum.

Finchley District Council has increased the salary of Mr. E. Calvert, electrical engineer, from £500 to £525 per annum.

COMPANIES' MEETINGS AND REPORTS

LANARKSHIRE TRAMWAYS CO.—There was a net profit of £15,477 for the June half-year, and a dividend at the rate of 5½ per cent. per annum is declared, carrying forward £6,045. The traffic receipts increased by £4,058, and the expenses by £2,913.

BOMBAY ELECTRIC SUPPLY & TRAMWAYS CO.—The annual meeting was held last week under the chairmanship of Sir Edward Sassoon, Bart. The tramway revenue increased by £8,628, in spite of the depression in the mill industry. The proposal of the company for a small increase in a few of the long-distance fares has been met in a sympathetic spirit by the Corporation, and the new fares have now been instituted. It has been decided to construct ten new single-deck trailer cars in order to deal with the traffic at rush hours. The revenue from the electric supply undertaking increased by £9,800. During the year it has been decided to substitute a flat-rate system and to abandon the maximum-demand system of charging. The chairman regretted the inability to pay dividends upon the ordinary shares, but he thought their patience would be well rewarded in the near future.

NEW GENERAL TRACTION CO.—The amount received from the subsidiary companies for the year to March 31st was £780 in excess of that for the previous year.

LIVERPOOL OVERHEAD RAILWAY CO.—The report for the June half-year shows a balance of £5,916 after meeting the 5 per cent. preference dividend. At the half-yearly meeting on Tuesday, Sir Wm. Fulwood, who presided, announced a slight increase in traffic since the previous year. This had produced an increase in revenue of £824, while the expenditure had been reduced by £524. The report was adopted, and a dividend of 5 per cent. on the preference shares was declared.

MAIN COLLIERY CO.—Sir George White, Bart., presided at the annual meeting of this company last week, and mentioned that by the use of electrical pumping, twice the amount of work was now being performed, in the two pits where electrical working had been installed. It is proposed to extend the supply of electricity to other pits and utilise it for pumping, ventilation, &c.

GREAT WESTERN RAILWAY.—In the half-yearly report it is stated that the mileage run by electric trains during the six months under review was 130,400, an increase of 1,912 over the corresponding period of 1909. The expenses of electric train working are given as follows:—Wages of trainmen, £1,290; current, £3,952; oil and stores, £534; repairs and renewals, £2,751.

LONDON, TILBURY & SOUTHEND RAILWAY.—At the half-yearly meeting on Thursday last, Mr. A. L. Stride, who presided, said that with regard to the new electric service between Ealing and Southend, a certain amount of time was necessarily occupied in getting a new service known. It was found, however, that every week the traffic of the through trains increased.

CENTRAL LONDON RAILWAY.—At the meeting on Thursday last, the Chairman, Sir Henry Oakley, said that the company was in a comfortable position, but the progress was slow. The contracts for the construction of the extension to, and new station at Liverpool Street, were referred to, and it was mentioned that the cost of the subway to the City and South London Co.'s booking hall in King William Street was to be borne by the latter company. The report and accounts abstracted on page 514 of our last issue were adopted.

METROPOLITAN DISTRICT RAILWAY CO.—The report for the June half-year shows that after providing for interest and other charges and setting aside £10,000 to renewals, there is a credit balance of £62,277. As already announced, the full dividend is declared upon the 4 per cent. guaranteed stock, and a dividend at the rate of 3 per cent. per annum on the 4½ per cent. preference stock. The number of passengers carried increased by no less than 3,230,413.

GREAT NORTHERN & CITY RAILWAY CO.—Lord Lauderdale, who presided at the half-yearly meeting on Wednesday last week, said that by reducing the working expenses, they had a small credit balance for the past year, apart from the fixed charges. This deficiency has been balanced as in previous years from those of their friends who were interested in the welfare of, and had confidence in, the undertaking.

BAKER STREET & WATERLOO RAILWAY CO.—After providing for interest, rents, and preference dividend, and reserving £4,000 for contingencies and renewals, the accounts for the June half-year show a net balance of £21,974. A dividend at the rate of 3 per cent. is recommended on the "A" ordinary shares, and 2 per cent. on the "B" ordinary shares, carrying forward £2,869. The number of passengers carried increased from 14,325,065 to 14,807,736.

CHARING CROSS, EUSTON & HAMPSTEAD RAILWAY CO.—After providing for interest and rents, and reserving £3,000 for contingencies and renewals, the accounts for the June half-year show a balance of £16,783, and a dividend at the rate of ¾ per cent. per annum is recommended on the ordinary shares, carrying forward £569. The number of passengers carried during the half-year increased fom 14,862,882 to 15,264,355.

GREAT NORTHERN, PICCADILLY & BROMPTON RAILWAY CO.—After providing for interest, rents, and guaranteed preference dividend, and reserving £6,000 for contin-

Digitized by Google

gencies and renewals, the accounts for the June half-year show a balance of £46,852. A dividend at the rate of 1½ per cent. per annum is recommended on the ordinary shares, and a balance of £8,972 is carried forward. The number of passengers carried during the half-year increased from 19,155,883 to 19,973,049. The report, in common with the reports of the two other affiliated companies, expresses appreciation of the services rendered to the companies by Sir George Gibb, and regrets that his retirement on accepting the chairmanship of the newly-constituted Road Board.

DUBLIN UNITED TRAMWAYS CO.—The half-yearly meeting was held in Dublin last week, under the chairmanship of Mr. William Murphy, who congratulated the shareholders upon an increase in receipts of over £5,000. On the question of renewals track, the chairman said he now looked upon this with more assured feelings than he had experienced in the past. They had been engaged for three or four years now in renewing their track, and had proof that they would be able to meet this additional demand upon their financial resources without inconvenience, owing to the increase in traffic and increase in gross profits.

NORTH METROPOLITAN TRAMWAYS.—The accounts for the half-year ended June 30th show a net profit of £385, so that, with the addition of £81 brought forward, £466 is to be carried forward.

A.-G. BROWN, BOVERI & CIE., BADEN, SWITZERLAND.—A dividend of 8 per cent. is proposed, as against 11 per cent. in the previous year. The dividends of the affiliated companies for the past year are as follows:—Gesellschaft Motor, 6 per cent.; Elektricitäts Ges., Baden, 5 per cent.; Brown, Boveri & Cie., A.-G., Mannheim, 4 per cent. (against 6 per cent. in 1908-9); Technomasio Italiano, Brown, Boveri, Milan, 6 per cent.; Electro-Mécanique le Bourget, Paris, 10 per cent.; Akt. Norsk Electrisk & Brown, Boveri, Christiania, 3 per cent.

NORTH MELBOURNE ELECTRIC TRAMWAYS & LIGHTING CO.—The report for the year to September 30th, 1909, states that the undertaking is still managed by Messrs. J. G. White & Co. Whilst the net revenue shows a slight increase in both departments, the directors are not satisfied with the results. The company, however, is gradually extending its electric supply business, and the directors believe the undertaking generally will show a steady increase in the future. The directors serve without fees, and Messrs. J. G. White & Co. merely charge out-of-pocket expenses in regard to management.

BLACKPOOL AND FLEETWOOD TRAMROAD.—The report for the half-year ended June 30th, gives the profit, after providing for debenture interest, as £5,277. A dividend at the rate of 4 per cent. per annum is recommended, with £750 transferred to depreciation, and £500 to reserve, and £1,027 carried forward.

MISCELLANEOUS CITY NOTES

MORTGAGES AND CHARGES.—Particulars of the following have been registered:—Institution of Electrical Engineers.—Mortgage and instrument of charge, both dated July 15th, 1910, to secure £11,500. Property charged, 15-18, Tothill Street, Westminster, and land in rear thereof. Holders—Economic Life Assurance Society, 6 New Bridge Street, Blackfriars, E.C.

DIVIDENDS, &c., ANNOUNCED.—Consolidated Electrical Co., 3½ per cent. for the year. Melbourne Tramway and Omnibus Co., bonus at the rate of 5 per cent.—Brompton & Kensington Electricity Supply Co., interim dividend of 9 per cent. per annum.—Waste Heat and Gas Electrical Generating Stations, Ltd., 5 per cent. per annum for the half-year ended July 31st.

Bank für Elektrische Unternehmungen, Zürich. A dividend of 10 per cent. is proposed for the past year as in the year 1908-9.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 5s. per ton (last week, £57 15s. to £58 5s.).

DISSOLUTIONS OF PARTNERSHIP.—W. J. Richardson Fox, Junior, and Arthur Brooke, electrical engineers, Victoria Garage, Bradford Road, Batley, have dissolved partnership.

E. Jennens, A. E. Summers, and G. F. Summers, electrical engineers, 6 Fisher Street, Gosta Green, Birmingham, have dissolved partnership.

BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—The first and final dividend of 7s. 3d. in the £1 is to be paid in the bankruptcy of Messrs. Platt & Bleasdale, electrical engineers, Victoria Square, Bolton. The dividend is payable to-day at 10 Acresfield, Bolton.

NEW COMPANIES

THOMAS BRITTAN, 34 Risinghill Street, Pentonville, London. Capital, £500. To take over the telegraph, telephone, and electrical instrument business already carried on at the above address.

C. H. HARE & SON.—Capital, £12,000 in £1 shares (4,000 pref.), mechanical and electrical, general engineers, &c. To adopt an agreement with the Caribonum Co., Ltd. Private company. Registered by Radford & Frankland, 27 Chancery Lane, W.C.

SOUTH LONDON ELECTRIC THEATRES.—Capital of £1,500). To take over all or part of the business and assets of the Greenwich Electric Theatre, now carried on at St. Peter's Hall, Bridge Street, Greenwich, and to adopt an agreement with A .W. Grist. Office: 19 Laurence Pountney Lane, E.C.

HOLOPHANE.—(Capital, £200,000.) To acquire from O. A. Mygatt, of Paris, all his interests in the Holophane system of illumination in all parts of the world, except France and the French Colonies, including (*a*) the whole of the share capital (200,200 dollars) of the Holophane Glass Co., of New Jersey, U.S.A., which possesses the exclusive right, subject to certain contracts, of manufacturing and selling Holophane scientific glassware in North America; (*b*) the right to the use and goodwil of the word "Holophane," in all parts of the world, except North America, France, and French Colonies; (*c*) the business carried on by O. A. Mygatt at 12 Carteret Street, S.W., and elsewhere, as the Holophane Co.; and (*d*) all patents, secret processes, trade marks, and designs relating to glassware for artificial lighting purposes, belonging to the vendor, except so far as they may exclusively relate to such countries aforesaid. First director, O. A. Mygatt (President of Holophane Glass Co., of New Jersey), Lt.-Col. F. J. P. Butler, G. C. Glynn (manager, Holophane Co. of London), Lord Ernest William Hamilton, and R. Woodhouse, jun., Registered offices: 12 Carteret Street, S.W.

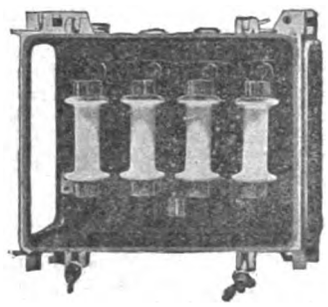
ENGINEERS' STANDARDISED PUBLICATIONS ASSOCIATION, Craven House, Kingsway, London. Capital, £2,000. To take over the business of agents for the classification and distribution of manufacturers' trade circulars carried on by F. Samuel and J. D. B. Innes at the above address.

DAC ACCUMULATOR SYNDICATE, 39 Red Cross Street, London, E.C. Capital, £25,000. Electrical engineers and contractors. To adopt agreement with G. Schauli, F. T. W. Price, and H. E. Hughes, for the acquisition of certain patents.

DARTMOOR ELECTRIC SUPPLY CO.—Capital of £4,000 in £1 shares, to carry on at Bovey Tracey and elsewhere the business of an electric light company in all its branches, and to adopt agreements with J. H. Lee for a lease of a mill and premises at Bovey Tracey, and with A. J. Wyatt, relating to the supply of any surplus power required by the company. Registered office, 12 Market Street, Newton Abbot, Devon.

LOCH LEVEN ELECTRICITY SUPPLY CO.—Registered by Messrs. Batten, Proffitt & Scott, 13 Victoria Street, London, S.W. Capital, £10,000 in £10 shares. To take over so much of the undertaking of the Loch Leven Water & Electric Power Co. as relates to the supply and distribution of electrical energy (other than the supply to the factories and works of the British Aluminium Co., Ltd.). To carry on at Kinlochleven and elsewhere in the counties of Inverness and Argyle, the business of an Electric Light & Power Co. The subscribers are W. B. Rommeh, engineer, 1 London Wall Buildings, London, E.C., and G. Fleet, contractor, Abchurch Yard, Cannon Street, London E.C.

M. & G. TRUCK & ENGINEERING CO.—Capital £5,500. To carry on the business formerly carried on by Mountain & Gibson, Ltd., Elton Fold Works, Bury, and to adopt an agreement with Hobdell, Way & Co., Ltd. Private company. Registered by Lawrence, Webster, Messer, and Nicholls, 14 Old Jewry Chambers, E.C.



TITAN ELECTRIC CO., 792 Salisbury House, London Wall, E.C. Capital, £8,000. To adopt an agreement with S. de Szepczynski for the acquisition of a business of manufacturers of electric batteries and accessories.

CHAPMAN MOTOR STARTER SYNDICATE.—(Capital of £5,000 in £1 shares.)—To adopt an agreement with A. S. J. Chapman for the acquisition of the invention for an improved arrangement of a combined collector ring commutator and switches for use with a small battery to start petroleum engines fitted with magnetic-igniting apparatus. Registered office: 21 Great St. Helens, E.C.

DRILLS.—Registered by T. Hull & Son, 22 Chancery Lane, London. Capital, £2,000. To adopt an agreement between R. S. Crawford and J. Scott for the acquisition of patents relating to electric mining drills and other electrically driven percussive tools, &c.

SUMMARY

We have received letters from several consulting engineers complaining of the rule that only corporate members of the Institution of Civil Engineers shall be admitted to the newly formed Association of Consulting Engineers. (Page 530.)

The Post Office opened last Saturday the new central telephone exchange at Glasgow. It replaces an old flat-board exchange on the call-wire system, and is a 10,000 line C.B. exchange with many new features. The equipment was supplied and manufactured by the Peel-Conner Telephone Works, Ltd. In the operator's cord circuit the repeating coil is dispensed with, condensers are included in the speaking circuit, and a 40-volt battery is used instead of a 24-volt. Our article contains diagrams and explanations of the circuits and illustrations of some of the apparatus. (Page 531.)

The Grille water tube boiler, which is being introduced into this country, has several features of interest. One end of the tubes which are bent enters the steam drum above the water level, and means are provided for blowing the water out through a blow-off cock in the lower header to clean the tubes. Cartridges with ¼ in. openings are inserted in the lower ends of the tubes to restrict the flow of water into them, and this is claimed to increase the evaporative capacity and to prevent excessive discharge of water in the event of a tube bursting. (Page 533.)

Some progress was made at the unofficial meeting of the International Electrotechnical Commission held in Brussels last week. The alphabetical method of dealing with nomenclature is to be replaced by a more logical arrangement proposed by the German Committee. Symbols and the rating of electrical machinery were discussed. There is every probability of the official meeting of 1911 being held at Turin during the period of the International Exhibition. (Page 534.)

In accordance with our practice of last year we are publishing some particulars of the courses of instructions in electrical engineering which are given at the various universities, colleges, technical institutes, &c., about the country. Particulars are given in this issue of the Electrical Engineering courses at Cambridge and Oxford, and the leading universities, colleges, and technical schools in the provinces, giving an idea of the length and nature of the course, the fees, and the degrees or certificates that can be taken. The colleges, &c., in London will be dealt with next week. (Page 535.)

The Electricity Committees of fifty-one local authorities have already signified their intention of supporting the Bill to be promoted to confer upon all local authorities owning electricity works the right of wiring houses and selling and hiring lamps, fittings, motors, &c. (Page 538.)

Among the specifications published by the Patent Office on Thursday last was one by A. M. Taylor describing the use of a single battery booster on a three-

Digitized by Google

wire system, the neutral point being obtained by means of tappings on the booster armature winding connected through slip-rings to a static balancer.—C. J. Beaver and E. A. Claremont have patented a joint box for protecting the junction of overhead copper and aluminium cables.—A simple lamp-shade ring is described by C. Arnold.—Opposition has been entered to the grant of a patent to the British Thomson-Houston Co. for a system of electrical propulsion for ships.—A patent by F. J. Chaplin for copper gauze dynamo brushes expires on Monday, after a life of fourteen years. (Page 540.)

The Birkenhead tramway system has shown a profit of £1,832 against the previous year's loss of £407.—The floods in Tokyo are causing failure of the electric light service.—A new system of fares has been inaugurated on the London United Tramways.—The "fair fare" system has been abandoned by the Potteries Electric Traction Co.—Trolley omnibuses are to be adopted in Stockholm. (Page 539.)

Tenders are invited for switchboard extension at Hackney, and cables at Ipswich. (Page 541.)

Over 36 million passengers have been carried during the last half-year on the Metropolitan District Railway, and the receipts have increased by £26,000.—The report of the Underground Electric Railway Co. of London states that the income from investments for the last six months shows an increase of 17 per cent.—The Mersey Railway has reduced its balance to debit of net revenue from £18,414 to £11,821. (Page 543.)

CORRESPONDENCE

THE ASSOCIATION OF CONSULTING ENGINEERS.

In two recent issues we published some information with regard to the newly-formed Association of Consulting Engineers. There is little doubt that there is room for such an association, and that it can do good and useful work; but the rules which have been formulated will, if unaltered, deter a large number of consulting electrical engineers of high standing and with good practices from becoming members. One of the rules mentioned in our previous articles is that to qualify for membership, gentlemen must be Corporate Members of the Institution of Civil Engineers; associate membership or even full membership of the Institution of Electrical Engineers is apparently not considered by the founders of the Association to be a sufficient qualification. There are upwards of thirty full members of the Institution of Electrical Engineers who practise as consulting electrical engineers, and who have ample qualifications to undertake consulting electrical engineering work, either of a special or a general nature, but are not Members or Associate Members of the Institution of Civil Engineers. Some of these gentlemen have already large practices, and no association of consulting engineers could be considered to be representative of the electrical engineering branch of the profession if they were excluded. In addition to these, there are many Associate Members of the Institution of Electrical Engineers who are amply qualified to practise. We publish below some letters on the subject which we have received from correspondents.

To the Editor of Electrical Engineering.

Sir,—In response to your invitation to state my views with regard to the proposed Association of Consulting Engineers, I have to say that I am entirely in sympathy with the movement, and consider that such an Association would, if properly conducted, be able to do a great deal of useful work. I consider, however, the proposal to enrol only those who are corporate members of the Inst. Civil Engineers a questionable one, as it means the exclusion of a number of well-known consulting electrical engineers, who will certainly object to being forced to apply for membership to an institution that has only an indirect connection with their work, in order to qualify for admission to the proposed Association. Membership of the Institution of Electrical Engineers should be a sufficient qualification. The proposed rule would, I venture to think, create a certain amount of dissatisfaction and opposition (already the technical press are adversely commenting on the point).

There are many consulting engineers of undoubted reputation, position and influence who are independent of any institution, and whose co-operation would be of considerable value, and it would be a pity to exclude them from membership of the Association solely because they are not members of the Inst. Civil Engineers.

If membership is to be confined to the Inst. Civil Engineers, then a similar association will become necessary to embrace members of the Inst. Electrical Engineers.

I should like to qualify my remarks by stating that I am not conversant with what has passed at the meetings held in connection with the proposed Association.—I am, dear Sir, yours very faithfully,

S. G. Castle Russell.

19 Lombard Street, E.C., Aug. 13th, 1910.

To the Editor of Electrical Engineering.

Sir,—Every engineer, whether a consultant or otherwise, will doubtless agree that the proposal to form an Association of Consulting Engineers is in the best interests of the profession generally, and of consulting engineers in particular. Such an association should be able, by weeding out unqualified men, to raise the status of consulting engineers, and put them on the same footing as solicitors and doctors. Membership of the Association should be a guarantee to the public that conscientious, impartial, and efficient technical advice will be given. Further, the Association should do a great deal to protect the interests of consulting engineers against the encroachments which are being made from many sides, but which it is not necessary to particularise here.

In order to exclude unqualified men, some sort of test must be applied, but the test proposed by the promoters, viz., corporate membership of the I.C.E., is quite unreasonable. Although at the time of its formation the I.C.E. could claim that it embraced all kinds of engineering other than the military branch, the conditions are now entirely altered: mechanical engineering has immensely developed since that time, and electrical engineering may be said to have come into existence during the last fifty years. The importance of these branches led to the foundation of the I.M.E. and the I.E.E., both of which are flourishing bodies with large membership, and it is, I think, generally recognised now that it is sufficient for an engineer to join the institution representing his particular branch. If the proposed rule comes into force, many electrical engineers perfectly well qualified to act as consultants will be debarred from joining the Association, and will consequently labour under a serious disadvantage in their professional career.

To take my own case: I am a full member of the I.E.E., and hold a degree of London University; further, I have had some twenty years' practical experience in the branch to which I have devoted myself, and the firm to which I belong has carried out responsible work with success. Since, however, I am not a corporate member of the I.C.E., I am not eligible for admission to the Association. It is surely unfair to expect that a busy consulting engineer who has left college many years should be compelled to take the examination for admission to the I.C.E. What an

Digitized by Google

outcry would have been raised if, when the examination for admission to the I.C.E. was instituted, all existing members had been required to pass that examination or cease to belong to the institution! Whatever is decided in the case of subsequent applicants, I maintain that it is unjust that members of *bonâ fide* firms of consulting engineers already practising should be excluded from the Association on account of their not being members of the I.C.E. In my opinion a more reasonable method of procedure would be to require applicants for admission to submit their claims, which would be considered by a sub-committee for the branch to which they belonged.

I must apologise, Sir, for the length of this letter, but the subject is one which concerns many electrical engineers beside myself. I trust that you will take the question up, so that it may be well ventilated.

Yours truly,

Birmingham. FRANK J. MOFFETT.

August 15th, 1910.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Will the Association of Consulting Engineers be a truly representative body if its membership is to be confined to "those who are corporate members of the Institution of Civil Engineers?"

There must be a number of consulting engineers, thoroughly competent in their own specialty, who would be excluded by this restriction; and it is open to question whether they or the new Association would be the poorer for their exclusion.

Certainly in some special lines of work, as, for example, telephony, the man who has spent his life in the work is better qualified than the average corporate member of the Civils.

It is to be hoped that in justice to those who for a variety of reasons have not been able to join the Civils, the proposed restriction will not be maintained.

I am, &c.,

HERBERT LAWS WEBB.

35 Old Queen Street,
Westminster. *Aug. 15th*, 1910.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—By limiting the new Association to Members and Assoc. Members of the Institution of Civil Engineers an extremely easy method would be found of only admitting a good class of consulting engineer.

At the same time, there are a number of consulting electrical engineers of good standing who would wish to join the Association, and who would be excluded by the proposed regulation. In my opinion, this would be a mistaken policy.

Aug. 13th, 1910. C. C. F. MONCKTON.

NEW CENTRAL TELEPHONE EXCHANGE AT GLASGOW

EXCEPTIONAL interest attaches for several reasons to the new "Central" telephone exchange which was opened for public service in Glasgow on Saturday. It is the largest common battery exchange (10,000 line) exclusively of British manufacture that has been erected in this country; it marks the advent of a new competitor, the Peel-Conner Telephone Works, Ltd., in the business of large telephone exchange equipments; it embodies several new developments in the circuits and other technical details; and it is one of the first outward and visible signs of working arrangement between the Post Office and the National Telephone Company, preparatory to the acquisition of the company's system by the Post Office at the end of next year.

There is so much to describe in the new exchange from the point of view of the electrical engineer that any reference to historical matters must perforce be brief, but it may be noted that the new exchange replaces the old flat-board call-wire exchange built by the Glasgow Corporation to compete with the National Telephone Co. The existence of two independent and rival systems in one city without adequate intercommunication prevented the development of telephony in Glasgow to the same state of efficiency as in other towns of similar importance, and the terms of the agreement between the Post Office and the National Telephone Co. a few years ago to facilitate the new arrangements for working the telephone system of the country after the end of next year made the position of the Glasgow Corporation telephone department almost desperate. After a period of negotiation, the Corporation's system was acquired by the Post Office, who wisely decided to "scrap" the call-wire exchange and agreed with the National Company to transfer to the new central exchange a large portion of the company's subscribers.

The exchange is situated on the top floor of the new Post Office Building in Waterloo Street, a street in the very centre of the city, and it is all upon one floor. It is rare that it is possible for accommodation to be found on one floor, for the power plant, the main and intermediate distributing frames, the battery, and the switchboard itself, but it has been done in this case. The area covered is about 245 ft. by 107 ft., of which about 180 ft. by 65 ft. is occupied by the switchroom. The length parallel to the switchroom is taken up by the battery and power-rooms, the main and intermediate distributing frames with the meter and relay racks, and the linesmen's rooms, and beyond this are the operators' rooms, &c. The lead-covered cables enter the basement of the building from the street, and are brought right up to a cable run which supports them behind the main frame. This support accommodates the solid joints between the cables and the lead-covered, silk- and cotton-covered cables, which are used to lead to the main frame itself. The line side of the frame has a capacity of 16,560 circuits, made off on 69 verticals, and the exchange side 13,800 circuits arranged in 69 verticals. The fuses are upon the line side, and the heat coils and lightning protectors on the exchange side. The I.D.F. has a capacity of 12,400 circuits.

There are 28 equipped subscribers' sections to the switchboard, and 12 on the junction board, with one unequipped, one cable-turning section, and a one-third section on each. The sections have a multiple capacity of 14,400 lines, and equipment for 10,000 lines. On the subscribers' board there are 960 outgoing junctions, multipled every two positions. Space is provided at each position for 150 answering jacks and lamps, but the present equipment is for 120. Each keyboard has 17 cord circuits and 40 junction order-wires. Each position on the junction board accommodates 26 incoming junctions. The interconnecting cables, in chases under the floor, between the switchboards and the apparatus racks, &c., are lead-covered.

In the power-room two independent supplies are brought in from the Glasgow Corporation mains, and it has, therefore, not been considered necessary to duplicate the battery. On emergency, the battery could be temporarily replaced by a supply direct from the mains. One of the main new features of the exchange is evident in the battery-room, as the battery has twenty cells in place of the customary twelve, and extra cells are not employed for the meters. The battery consists of Chloride cells of 3,230 ampere-hours capacity at the nine-hour discharge rate, and with an initial equipment of plates corresponding to 2,720 ampere-hours. There are two ringing sets, one driven off the common battery, and the other direct off the Corporation mains, and two 30-kw. motor-generators have been installed for charging the battery. The motor generators, power switchboard, &c., were manufactured at the Witton works of the General Electric Co.

Apart from the 40-volt battery, the chief feature of the system employed is the absence of the repeating coil in the operator's cord circuit and the inclusion of condensers in the speaking circuit. This arrangement was also adopted in the

Digitized by Google

new Cardiff exchange, equipped by another rival of the Western Electric Co., but the circuits are very different in other respects. Fig. 1 is an outline sketch of the transmission system. In an article reviewing generally the various C.B. transmission systems, published in the *Post Office Electrical Engineers' Journal* in April, 1908, Mr. M. Ramsay pointed out that this system was particularly adapted

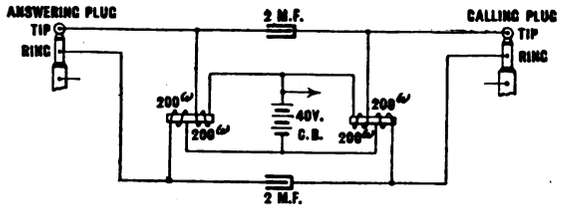

FIG. 1.—OUTLINE DIAGRAM OF THE TRANSMISSION SYSTEM.

for working on long and high resistance lines. Where there are small private branch exchanges to be supplied, in which current must be taken from the common battery, through the B-wire with an earth return, there would be objection to the 200-ohm relay coil between the battery and the B-wire, and also to a 200-ohm supervisory relay coil in a similar position in the cord circuit, but this class of service will not be catered for in Glasgow.

Fig. 2 is a more detailed diagram, showing the subscriber's line, the cord circuits, meter circuits, &c. Removal of the

If the wanted subscriber is not engaged, the insertion of the calling plug into his multiple jack energises his cut-off relay through the 400-ohm resistance, and disconnects his line relay and line lamp. While he is being rung, the supervisory lamp on the calling cord will glow, as the drop of voltage over the 400-ohm resistance is sufficient to energise it, but as soon as the subscriber has taken down his telephone the lamp will darken between the intervals of depressing the ringing key as the supervisory relay will be energised. When the subscribers hang up, the circuits of the supervisory relays are broken and the two lamps glow. The operator then depresses the meter key for effective calls, and clears.

The meter circuits should also be traced on Fig. 2; as already mentioned they are worked from the common battery without the usual extra meter cells. In addition to the subscribers' meters there are two meters connected to each position: a meter of 0·5-ohms resistance which records effective calls, and one of 500-ohms resistance for ineffective calls. When the answering plug is inserted in its jack, the 500-ohm winding of the subscriber's meter is connected to the battery, but is bridged by the cut-off relay, and the current passing through it is too small to actuate the meter. When, however, the meter key for effective calls is depressed at the conclusion of the conversation, the 400-ohm resistance between the battery and the sleeve of the plug is shunted by the 0·5-ohm position meter, and the subscriber's meter records. At the same time the armature of the meter places a 50-ohm coil in parallel with the 500-ohm coil, and the further increase in current is sufficient to actuate the 0·5-ohm

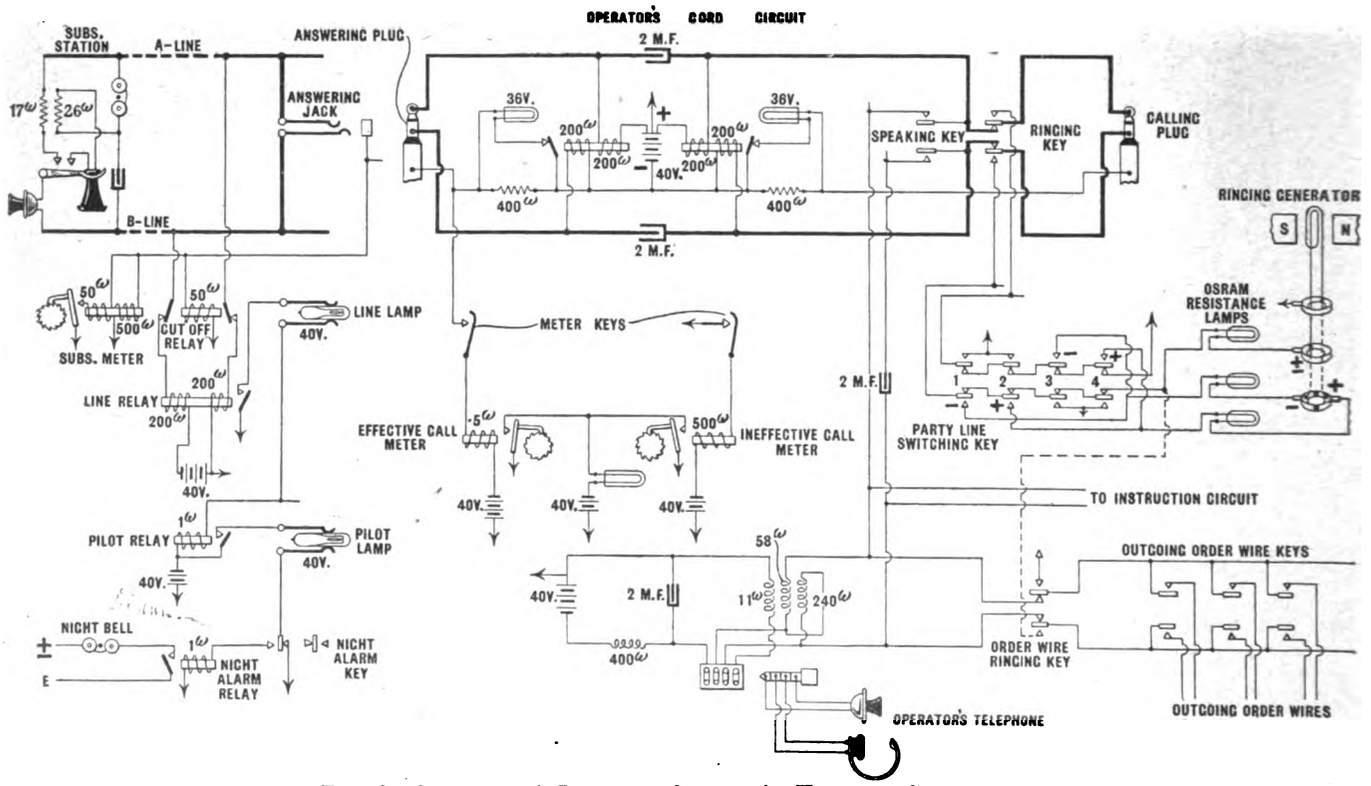

FIG. 2.—SUBSCRIBERS' LINE AND OPERATOR'S KEYBOARD CONNECTIONS.

subscriber's receiver from the switch-hook closes the circuit of the line relay and lights the 40-volt line lamp. Plugging-in the answering plug actuates the cut-off relay through a 400-ohm resistance and disconnects the line relay; at the same time the circuit of the supervisory relay on the answering cord is closed through the subscriber's instrument, and the 36-volt supervisory lamp is disconnected. On tracing out the circuit of the cut-off relay, it will be seen that, if a subscriber is engaged, the bush of his jack (and, therefore, all his multiple jacks) will be at negative potential, there being the resistance of the cut-off relay between it and the earthed side of the battery. The two-m.f. condenser connected through the tertiary of the operator's induction coil to the headgear receiver will be charged by the common battery when the speaking key is thrown over, but as the tip of the calling plug is at zero potential the condenser will be discharged to some extent when the bush of the multiple jack is touched by the tip of the plug, and a click will be heard by the operator.

"effective" position meter. The meter for ineffective calls is connected directly to the battery through its key.

In addition to the ringing keys on each cord, each position has one set of four party-line switching-keys on the Thompson and Robe system, enabling positive or negative pulsating currents to be sent between either the A or B line and earth.

On the incoming junction positions, there is a set of five ringing keys on each junction, four for party-line ringing and one for ordinary ringing, and the arrangement is such that the buttons of the party-line keys return to a half-way position after being depressed, and remain there even when the ringing circuit is automatically disconnected, until the next time a party-line key is depressed. This makes it simpler for the operator to ring up again if requested to do so. There is much that is interesting in the other details of the junction circuits, but space will not permit us to enter into them; there are seven different types of junction circuits, owing to the variety of exchanges that have to be connected to the Central.

Digitized by Google

The design of some of the pieces of apparatus mentioned is novel. The lamp jacks (Fig. 3) are entirely of metal; Fig. 4 shows the constructon of the line and cut-off relays, the line relay being at the top, and Fig. 5 illustrates a combined ringing and speaking key and a meter key. Fig. 6 is a strip of twenty multiple jacks, and these, as well as the answering jacks, are made with the A and B springs one on each side, instead of on the same side of the plug.

Those of our readers who desire to study the design of this exchange in greater detail should refer to an article by Mr. J. W. Turner, of the Engineer-in-Chief's Department of the Post Office, which appeared in the *Post Office Electrical Engineer's Journal* for last January. We are indebted to this article for the greater part of the technical particulars we have given above, and also to the Peel-Conner Telephone Works, Ltd. (Midland Bank Chambers, Queen Victoria Street, E.C.), for the loan of the blocks illustrating their apparatus. This company has taken over from the General Electric Co., Ltd., the telephone manufacturing branch of the latter company's business, and the whole of the Peel works in Salford. They manufacture, sell, and erect telephone exchange equipments, but the General Electric Co. remain sole selling agents for their house telephones, etc.

THE GRILLE WATER TUBE BOILER

DEMONSTRATIONS are being given at the engineering works of Messrs. Fraser & Fraser, Ltd., Bromley-by-Bow, London, by the British Grille Water Tube Boiler Co. (Craven House, Kingsway), of the special advantages of the Grille boiler. This boiler is already largely in use in France, and is now being introduced into this country by the above company. On Friday last we inspected the boiler erected at Messrs. Fraser & Fraser's works, and were enabled to witness a special test demonstrating that, should a tube burst, there is no danger of scalding accidents to stokers.

As shown in Fig. 1, which is a sectional elevation of the boiler, there is one steam drum with top and bottom headers *C* to which are attached the steam generating tubes. The top headers are above the water level, so that the steam, instead of entering the drum through the water, enters above the water level in a dry state. The tubes are arranged in sections of forty-seven tubes, each section having separate top and bottom headers. The steam separator pipe is shown at *T*. The tubes are bent U-shaped, and the necessity for mechanical cleaning of the tubes, usual with straight-tube boilers, but impracticable with bent tubes, is claimed to be avoided by the provision of a system of reverse circulation. This is effected by closing an internal valve *R* between the water drum and one of the lower headers. The supply of water is thus cut off from that particular section, and by opening the blow-off cock in the corresponding lower header, the water is blown out of the tubes by the steam, which scours the tubes and removes any deposit.

The principal feature of the Grille boiler, however, is the use of "Solignac" tuyeres or cartridges, with ¼ in. openings, which are placed in the ends of the one-inch tubes attached to the lower headers, as shown at *t* in Fig. 1. These restrict the amount of water admitted, and, it is claimed, enable a higher rate of evaporation to be secured than in boilers which have the tubes logged with water. Each section of tubes evaporates 1,100 lbs. of water (actual)

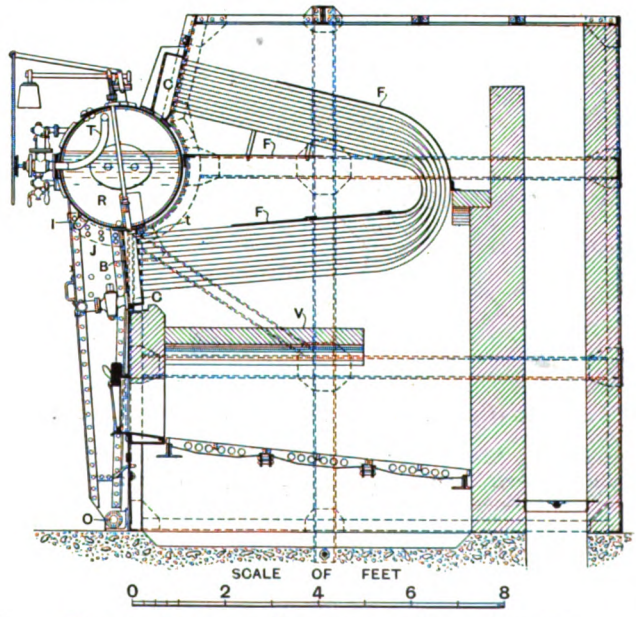

Fig. 1.—Sectional Elevation of Grille Boiler.

per hour from feed water supplied at 60° Fahr. Thus, a boiler with seven sections will evaporate 7,700 lbs. of water

Digitized by Google

per hour. The maximum number of sections per drum is nine. An evaporation of 6 lbs. of water per hour per square foot of heating surface on normal duty is said to be obtained, and no trouble is said to be experienced when evaporating at the rate of 12 lbs. For special purposes, when burning 70 lbs. of coal per hour per square foot of grate area, 18 lbs. of water (actual) may, it is claimed, be evaporated per square foot of heating surface, the efficiency under these

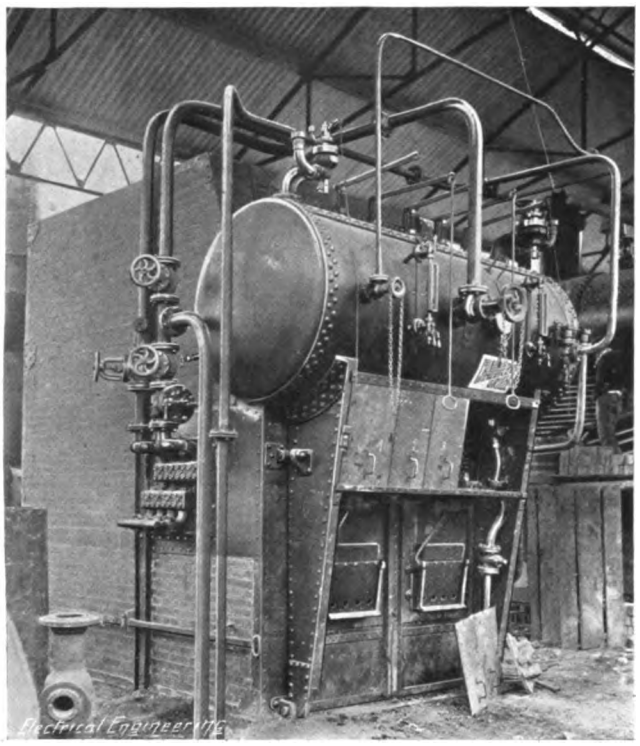

Fig. 2.—Grille Five-section Boiler with Superheater.

severe conditions being as high as 65 per cent. On normal duty and with natural draught of, say, half an inch, the boiler is claimed to give 76 per cent. efficiency. The temperature of the flue gases in the Grille boiler is about 650° Fahr. A reverberatory arch of firebricks *V* ensures smokeless combustion, and baffles *F* are provided to direct the course of the gases from furnace to flue.

The general appearance of the boiler is shown in Fig. 2, which illustrates a five-section boiler capable of raising 5,500 lbs. of steam per hour with natural draught, and fitted with a Grille nickel-steel superheater, the headers of which can be seen at the side of the boiler. This gives 100° of

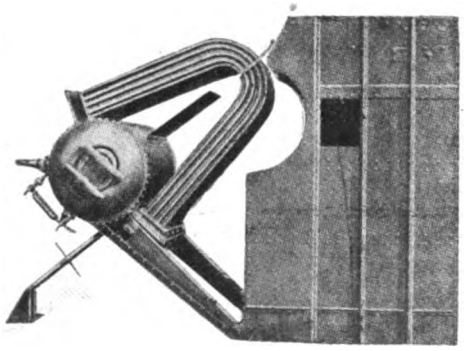

Fig. 3.—Drum and Tubes Swung clear of Casing.

superheat. Accessibility for examination of the pipes and drum is given by mounting the latter on steel standards *J*, which are hinged at the bottom to trunnions *O* fixed to the framework of the boiler. This enables both drum and tubes to be swung clear of the casing, as shown in Fig. 3.

The height of the boiler is 12·5 ft., and the depth 8·5 ft. The breadth is determined by the number of sections, each section being 13·6 in. wide. A boiler to evaporate 6,600 lbs. of water per hour would be 9 ft. 2 in. long, and the floor space (9·2 × 8·5), 78·2 sq. ft. From and at 212° Fahr. the evaporation of this boiler is 7,900 lbs. of water per hour, and allowing 20 lbs. of water per horse-power hour, the capacity is approximately 400 h.p., or 5·2 h.p. per sq. ft. of floor space. The weight is 7·4 tons, or 41 lbs. per h.p.

In order to demonstrate the effect of the "Solignac" tuyeres in lessening the danger due to explosion of a tube, an auxiliary tube of the full diameter has been fitted in the boiler at Messrs. Fraser & Fraser's works, with a rupture in it 6 in. by $\frac{3}{8}$ in., or double the cross-sectional area of the tube. This tube communicates with both the steam and water spaces of the drum, and by means of suitable valves steam or water, or both, can be discharged through the rupture. A "Solignac" tuyere is fitted in the water end of the tube. Whereas with an ordinary boiler the water would be rapidly discharged, and a great quantity of steam would be generated, the discharge from such a rupture in the Grille boiler, with 160 lbs. pressure, is said to be only $2\frac{1}{4}$ lbs. per second. The only effect produced was the damping of the fire, and no appreciable volume of steam was emitted. Further, when the blast was shut off after a few seconds, the fire burned brightly again. We understand that the inspector of the Boiler Insurance Co. reported so favourably on this demonstration that a considerable reduction was made in the insurance premium.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

Unofficial Meeting in Brussels

An unofficial conference of members of the International Electrotechnical Commission was held, at the invitation of the Belgian Committee, in Brussels on August 8th, 9th, and 10th, and through the courtesy of Mr. C. Le Maistre, the General Secretary of the Commission, we are enabled to publish the following interesting report of the proceedings. The conference was quite representative, in spite of being unofficial, and it is generally felt to have relieved the tension with regard to the preparation for the full official meeting of 1911, by giving an urgently needed opportunity for the free ventilation of the ideas of the leading delegates. The meeting was convened by Col. R. E. Crompton, the Honorary Secretary, and Prof. Eric Gerard, Director of the Montefiore Electrotechnical Institute of Liège, presided. At the outset, Col. Crompton read a report on the general progress of the Commission, showing that sixteen committees had been officially formed; other committees were about to be formed in Holland and Switzerland, and a Russian committee was to be formed in October. Further, the Central Office in London was in close communication with Argentine, Chile, and Peru. The Commission has now been in existence for four years, and the immense amount of work expended in organising the various committees, and the mode of procedure is at last bearing fruit. The official languages of the Commission are English and French, the German section having courteously withdrawn their wish that German should be one of the official languages.

The first subject dealt with at the Conference was that of Nomenclature. Dr. E. Budde, a Director of Siemens & Halske, proposed, on behalf of the German Committee, that instead of dealing with terms in alphabetical order, some eighty words should be taken at a time all closely connected with some definite idea: this would avoid the necessity for dealing with so many out-of-the-way and rarely used words before the more important ones. This difficulty was admitted by several other delegates, and the proposal was adopted by the Conference to be put before the several Committees for consideration. The French, British, German, and Belgian Committees will prepare lists of definitions on this principle to be submitted to the Commission next year.

Symbols were next discussed, and it appears that some advance has been made along the lines so often advocated by Dr. Silvanus P. Thompson, namely, that principles have been dealt with instead of a huge list of symbols. The Conference agreed, provisionally, subject to the approval of the full Commission, that (1) instantaneous values of electrical quantities varying with time shall be represented by small letters: (2) effectual or constant values shall be represented by capital letters: (3) capital letters with the subscript "m" shall denote maximum values: (4) magnetic quantities shall be represented by Script capital letters. Further, the following symbols were provisionally agreed upon:—Electromotive Force E and e, Electrical quantity Q and q, Length L and l, Mass M and m, Time T and t, all in ordinary type, and the "Script" forms of **L, H,** and **B** for Inductance, Magnetic Force, and Flux Density respectively (instead of the more convenient block letters, which offer no difficulty to the printer in any country). The use of μ almost universally employed for perme-

Digitized by Google

ability, was discussed, but it was not adopted finally as the French Committee propose that, as a matter of principle, Greek letters should not be used in this manner, and this proposal may possibly be adopted. Another question discussed was the signs to be given to the direction of rotation of vectors, which, it will be remembered, is different with different authors, clockwise rotation being positive with some and negative with others.

A discussion also took place on the rating of electrical machinery. Dealing first with continuous-current machinery, the Conference decided to place the following proposal before the Commission: That the output of a machine should be, for a generator, the electrical power measured at the terminals of the machine; and, for a motor, the mechanical power at the shaft; the power in each case to be expressed in watts or kilowatts. This would avoid the confusion due to the different values of the "horse-power" in different countries.

There is every probability that next year's plenary meeting of the Commission, under the presidency of Prof. Elihu Thomson, will be held at Turin. When the matter was brought up, Signor Semenza, the Italian delegate, mentioned that he had received correspondence from Paris with reference to an Electrical Congress to be held at Turin in connection with the 1911 International Exhibition, and it seemed a pity that the Commission should be meeting at Berlin, as was proposed, at the same time. Dr. Budde agreed, and said that if it was decided to hold an electrical congress at Turin, the German Section would willingly forego the pleasure of having the full meeting at Berlin.

ELECTRICAL ENGINEERING EDUCATION

IN response to frequent inquiries from prospective electrical engineers or their parents, we published last year an article giving the principal features of the courses of instruction at the various universities, technical colleges, &c., throughout the country. The success of this article has made us think that a similar collection of information relating to the courses about to commence this autumn may be of use. It is well known that an electrical engineer's education cannot be completed by college training alone; a period of pupilage or apprenticeship at an engineering works is essential, and this can either be taken before or after the college course, or "sandwiched" between two or three periods spent at the college, according to which method would be best suited to the physical and mental aptitude of the particular student. The choice of the works in which the practical part of the training is to be given is usually decided by the special circumstances of each case, but in the selection of a suitable college there is considerable choice. For further particulars, intending students should apply to the registrars of the various colleges.

I.—THE UNIVERSITIES OF CAMBRIDGE AND OXFORD

At both Cambridge and Oxford an engineering course has been established, and engineering subjects may be taken for degrees. Whether the student will proceed, as is usually done, straight to the University from school, or whether he will find it more convenient to work a short period in the shops of an engineering works, and perhaps also attend elementary technical classes before going up, will depend on each individual case. Both courses are possible, and in some cases the latter may be preferred in view of the age the student will have attained before taking his degree.

The University of Cambridge.

The laboratories of the engineering department of Cambridge University are open to, and the lectures may be attended by, any matriculated member of the University, whether he be a member of a particular college or not. In order, however, for him to take the mechanical sciences "tripos" examination, which qualifies for the honours B.A. degree, he must pass the "previous examination" in general subjects (including classics), either on entry or afterwards. He must also pass the qualifying examination in mathematics and mechanics at the end of his first year.

The most important feature is that the student has to reside at Cambridge for three years, and the value of this is now fully realised by many employers. The training is of such a character that it is of real educational value, even to one who is not going to take up engineering as his profession.

Prof. J. A. Ewing, F.R.S., was for some time Professor of Mechanism and Applied Sciences, and was succeeded by Prof. B. Hopkinson, who is assisted by a number of lecturers and demonstrators. The electrical work is mainly under the charge of Mr. C. G. Lamb.

The students, whatever branch of the profession they intend to enter, go through the same course as far as the elementary work is concerned; but a certain amount of specialisation is permitted to those who can take the advanced papers. The usual honours course covers three years. During the Long Vacation there are no formal lectures, but demonstrations are given in the laboratory, a drawing class is held, and the workshops are open. There is also a "special" examination of an easier character, which qualifies for the B.A. degree without honours, and is preceded by certain examinations in general subjects.

A student who has graduated in another university may obtain the B.A. degree at Cambridge by residing for two years and by getting a first class in the engineering tripos, or by submitting a dissertation of sufficient merit describing original research carried on at the engineering laboratories.

A few words should be added about the Engineer Company of the Officers' Training Corps, which is an important development of the Engineering School. The members of the Company do a good deal of military engineering work, such as bridge-building, and they also have a steam tractor on which some important trials are now being carried out. A good many of the members of the Company become officers in the Special Reserve Royal Engineers for a year after leaving Cambridge, and the training generally is of very considerable value.

The University of Oxford.

The Chair of Engineering Science at Oxford is occupied by Prof. C. F. Jenkin, and engineering subjects may now be taken in the Final Honours School of Natural Science for the honours B.A. degree.

The course of study recommended may be taken in three years, and is intended to be followed by an apprenticeship at some engineering works, or by a pupilage at an engineer's office; but it may be taken after part or the whole of the apprenticeship, if that is preferred. No attempt is made to teach any technical handiwork, but instruction in the engineering laboratory forms an important part of the course. Engineering drawing also takes a prominent position, and instruction in surveying is given during the Long Vacation. Physics, including electricity and magnetism, is taught in one of the university laboratories, where special courses, as far as they are required, are provided for the engineering students. Thus students who intend to take up electrical work may take advanced applied electricity and magnetism as a special subject.

All undergraduates are required to pass "Responsions" or an equivalent examination, which may be done before coming into residence, after which no further examination has to be passed till the "Final Honours School," which is usually taken at the end of the third year. Facilities will be given to advanced students and graduates to undertake research work in the engineering laboratories.

II.—UNIVERSITIES, COLLEGES, AND TECHNICAL SCHOOLS IN THE PROVINCES

The large modern universities in most of the principal towns have electrical engineering departments, at which the student can obtain a thorough theoretical groundwork in the principles of electrical engineering, while at the same time he has the opportunity to broaden his mind by other studies as well. At the larger technical colleges, a sound education in electrical engineering is also given, and there are a large number of technical schools and institutes, at most of which

Digitized by Google

the evening classes are the all-important feature, and where the apprentice and workman may acquire a knowledge of the principles underlying their trade. Many of these schools also give instruction in day classes, by taking the full course of which an education of a similar character may be obtained to that at the technical colleges. We have not attempted to make any classification, but have arranged our descriptions alphabetically under the names of the towns.

Bangor.

University College of North Wales.

The department of Electrical Engineering is under the Professor of Physics, Dr. E. Taylor Jones. The course extends over two years. The laboratory equipment includes some electrical machinery, but the course is intended to be a preliminary training to be completed by practical work in an electrical engineering works. Fee, £14 14s. per annum. Students at the University are required to reside in registered lodgings.

Belfast.

Queen's University.

The subject of electrical engineering can be taken by candidates for the degree of B.E. (Bachelor in Engineering), and arrangements are in progress regarding the recognition of the courses at the Municipal Technical Institute, of which particulars are given below.

Municipal Technical Institute.

The object of this Institute is to provide instruction in the principles of those arts and sciences which bear directly or indirectly upon the various trades and industries. The classes are suitable for persons engaged during the day who wish to supplement and develop the knowledge and experience gained in the workshop, &c. The full course of electrical engineering is four years, and in the third and fourth year the more advanced branches of the subject are taught, including generator and converter design, &c. A course in electric wiring can be taken by second-year students. There is also a regular three-years' day course intended as a preparatory training for those who aim at filling positions of responsibility. Candidates for admission to this must be not less than fifteen years old, and must pass a simple entrance examination. The fees are low in all cases. Prof. R. Stanley is head of the electrical engineering department, and Prof. J. H. Smith of the mechanical engineering department.

Birmingham.

University of Birmingham.

The B.Sc. degree in engineering can be obtained after a four-years' course; the instruction in mechanical and electrical engineering embraces the same subjects throughout, only in the final year considerably more time is given to the designing and testing of electrical machinery in the latter case. Students are required to pass a matriculation or equivalent examination. Advanced students who have matriculated elsewhere are allowed to omit the first year of the course on passing the first intermediate examination. Students not wishing to take the degree are admitted to the courses on passing a shorter examination than the matriculation. In the fourth year the work includes the design of machines, apparatus, and complete installations to definite specifications. Prof. Gisbert Kapp is the Professor of Electrical Engineering, and Prof. F. W. Burstall of Mechanical Engineering. The fees are £34, £50, £50, and £55 respectively for each of the four years, in addition to which there is a membership fee of £1 1s. per annum, and a fee of £2 for each of the above examinations.

Birmingham Municipal Technical School.

Courses in electrical engineering are also held, and laboratory work is conducted at the Birmingham Municipal Technical School at low fees, and complete courses can be taken here by students desirous of obtaining a London University engineering or science degree. There are also afternoon classes, intended partly for apprentices and employees of local firms in electroplating and bronzing, electricity (intermediate), electrical engineering (advanced), and mechanical engineering, and complete evening courses, including special lectures in electrical engineering, electrical measurements, telegraphy, telephony, and instruction in jointing armature winding. Special drawing classes for electrical engineering students are also held. There is an entrance examination, which all students under eighteen years of age are expected to take. Certificates are awarded by the Board of Education, and also for technological examinations held by the City and Guilds of London Institute, and various prizes and scholarships are obtainable. Dr. W. E. Sumpner is the Principal and head of the Physics Department.

Bradford.

City of Bradford Technical College.

Students may enter at the age of fifteen, and have to pass a simple entrance examination. The ordinary electrical engineering diploma course is three years, but there is a fourth-year course for those who can stay for it. Occasionally students of exceptional attainments are excused the first year. The fourth year's course deals more in detail than that of the third year with the theory, design, and testing of machines, and with central station practice. The head of the department of engineering is Prof. G. F. Charnock, and Mr. W. G. Griffith is lecturer in electrical engineering. The fee is £13 13s. per annum for the full course. Evening classes at low fees are given for persons (over sixteen years of age) engaged in the various trades, and special courses covering the work necessary, and the intermediate and final B.Sc., London, examinations have also been arranged. A four-years' evening course in electrical engineering can be taken.

Bristol.

Merchant Venturers' Technical College.

The Faculty of Engineering of the University of Bristol is provided and maintained at the Merchant Venturers' Technical College. Courses are provided in electrical and other branches of engineering, and the B.Sc. degree may be awarded in any of these branches. The curriculum for the degree is spread over three years, of which the first is common to all departments of engineering, and prepares for the intermediate examination. The second and third years prepare for the final examination, which is special for each branch. Provision is also made for the award of a Certificate in each branch of engineering, open to students who do not matriculate. Prof. David Robertson is head of the electrical engineering department, and, besides the assistant lecturer and demonstrators, there are special lecturers on telegraphy and telephony, and an instructor in electric wiring. Prof. John Munro is the professor of mechanical and mining engineering. The tuition fees for the complete course amount to £26 5s. per annum, but a reduction of £10 10s. is made in the case of students the combined income of whose parents is less than £350. There are also evening classes, the fees for which are lower.

Cardiff.

University College of South Wales and Monmouthshire.

This is a constituent college of the University of Wales. The three-years' course in engineering, which qualifies for the college diploma, can also be taken for the degree of B.Sc. in engineering. Specialisation in electrical engineering is only allowed in the third year of the course. Prof. A. C. Elliott, with two assistant lecturers and demonstrators, carries on the engineering department. An Engineering Scholarship amounting to £70 per annum is given by the South Wales Institute of Engineers. The fees are about £6 6s. per annum, with substantial reduction to members of associated colleges. Students must reside in registered lodgings and conform to an elaborate code of discipline.

Dublin University.

The School of Engineering, Trinity College, Dublin University, gives a four-years' course in electrical engineering, the fourth year being optional. The student is required to be a member of Trinity College, and has at the same time the opportunity of obtaining the advantages of a general university education. He has first to pass an entrance examination. A student will be entitled to obtain a Certificate in engineering, a Licence in engineering, a degree of Bachelor of Engineering, and a diploma in electrical engineering, according to the courses gone through and the examinations passed. Prof. W. E. Thrift is professor of experimental physics; Prof. T. Alexander, professor of civil engineering, is head of the engineering department; Messrs. W. Tatlow and P. S. Sheardown (electrical engineer to the Dublin United Tramways) are lecturers in electrical engineering, and Mr. W. E. Lilly lecturer in mechanical engineering. The fees amount to about £30 per annum, and there is an entrance fee of £15.

Digitized by Google

UNIVERSITY OF GLASGOW.

DEPARTMENTS OF ENGINEERING, MINING, AND NAVAL ARCHITECTURE.

Professor of Engineering ...	Archibald Barr, D.Sc., M.Inst. C.E., M.I.Mech.E.
Professor of Naval Architecture	J. Harvard Biles, LL.D., D.Sc., M.I.N.A., M.Inst.C.E.
Professor of Mining ...	Charles Latham, M.I.M.E.
Lecturer on Engineering Drawing and Design ...	Harry Bamford, M.Sc., A.M. Inst.C.E.
Lecturer on Electrical Engineering	John S. Nicholson, B.Sc., Whit. Sch., A.M.I.E.E.

The SESSION commences on October 17th, 1910, and ends on March 23rd, 1911. Students usually spend the summer months in practical work, thus receiving their training on the Sandwich system. Prospectus of the Courses for the degrees of B.Sc. and D.Sc. in Engineering and Syllabus of Classes will be forwarded on application to the Assistant Clerk, Matriculation Office, The University, Glasgow.

UNIVERSITY OF EDINBURGH.

ENGINEERING DEPARTMENT.

The next session opens on October 5th. The Preliminary or Entrance Examination is held in September. The University provides complete Courses in Civil, Mechanical, and Electrical Engineering, qualifying for the degree of B.Sc. in Engineering, and extending over a period of three years. Particulars of the Entrance Examination, Scholarships, Fees, and Courses of Instruction can be obtained from the Matriculation Office, The University, Edinburgh.

UNIVERSITY COLLEGE OF NORTH WALES.

ELECTRICAL ENGINEERING DEPARTMENT.

Professor of Physics :—E. TAYLOR JONES, D.Sc.
Drapers' Company's Assistant Lecturer and Demonstrator in Electrical Engineering :—W. E. WILLIAMS, B.Sc.

In October next a systematic COURSE OF INSTRUCTION IN ELECTRICAL MEASUREMENT and PRACTICAL ELECTRICITY for students proposing to enter the profession of ELECTRICAL ENGINEER will be commenced. The Physical Laboratory is equipped with a Compound Steam Engine, Continuous and Alternating Current (single and three phase) Dynamos and Motors, Transformers, Secondary Battery, and the most approved modern Measuring Instruments.

Fee for the Course, in ordinary cases, £14 14s. per Session. Average cost of living at Bangor for the Session (33 weeks), £20 to £30. The Course extends over two Sessions.

For Prospectus and further information apply to
J. E. LLOYD, M.A., *Secretary and Registrar.*

THE UNIVERSITY OF SHEFFIELD.

Session 1910–11.

Vice-Chancellor :—Sir CHARLES ELIOT, K.C.M.G., C.B., D.C.L., LL.D.

FACULTY OF APPLIED SCIENCE,
comprising
DEPARTMENTS OF ENGINEERING, METALLURGY, AND COAL MINING.

Dean :—W. RIPPER, D.Eng., M.Inst.C.E.

Professor of Engineering	W. Ripper D.Eng., M.Inst. C.E.
Professor of Metallurgy	J. O. Arnold, D.Met.
Assistant Professor of Metallurgy	A. McWilliam, M.Met.
Professor of Mining	F. W. Hardwick, M.A.
Professor of Applied Chemistry	L. T. O'Shea, M.Sc.
Professor of Mathematics	A. H. Leahy, M.A.
Professor of Physics	W. M. Hicks, Sc.D., F.R.S.
Professor of Chemistry	W. P. Wynne, D.Sc., F.R.S.

The Courses in Engineering, or in Metallurgy, extend over three years, and prepare respectively for the Degree of Bachelor of Engineering (B.Eng.), or the Degree of Bachelor of Metallurgy (B.Met.), of the University of Sheffield.

The LECTURE COURSES commence October 5th, 1910.

The TECHNICAL LABORATORY COURSES commence September 19th, 1910.

For Prospectus, giving further particulars and details of Courses, apply to
W. M. GIBBONS, *Registrar.*

THE UNIVERSITY OF LEEDS.

DEPARTMENTS OF ELECTRICAL, CIVIL, MECHANICAL AND MINING ENGINEERING, AND COAL GAS, FUEL AND METALLURGY.

The work of these Departments is carried on in separate blocks of buildings specially equipped for systematic instruction. Prospectus may be had free on application from the Registrar.

THE NEXT SESSION BEGINS ON OCTOBER 4th, 1910, on which day the ENTRANCE EXAMINATION will be held at 10 a.m. and 2 p.m.

EAST LONDON COLLEGE,

(University of London.)

Mile End Road, E.

NEW SESSION COMMENCES SEPTEMBER 26th.

The College is situated close to stations on the G.E.R., District Railway and L.T. and Southend Railway and is approached from The Royal Exchange in 15 minutes by motor omnibus. Electric tramcars from Wanstead, Leytonstone and Ilford pass the College.

CIVIL, MECHANICAL, AND ELECTRICAL ENGINEERING COURSES.

Fees : Ten Guineas per Session.

Courses in the evening are also held at moderate fees.

POST-GRADUATE AND RESEARCH WORK.

Calendar post free on application to the Registrar, or to
J. L. S. HATTON, M.A., *Principal.*

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE.

(A Constituent College of the University of Wales.)

DEPARTMENT OF ENGINEERING.

Drapers' Company Professor of Engineering :—
A. C. ELLIOTT, D.Sc., M.Inst.C.E., M.I.Mech.E.

THE NEXT SESSION will BEGIN on TUESDAY, OCTOBER 4th, 1910.

Particulars of the COURSES in ENGINEERING (Mechanical, Civil, and Electrical) may be obtained from the undersigned.

These Courses qualify for the B.Sc. Degree in Engineering of the University of Wales and for the College Diplomas in Engineering.

J. AUSTIN JENKINS, B.A.,
Registrar.

Cardiff,
July, 1910.

THE GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.

Glasgow.

Session 1910–11.

Day Classes begin TUESDAY, SEPTEMBER 27th.
Evening Classes begin THURSDAY, SEPTEMBER 22nd.

The DIPLOMA of the College is granted in the following Departments :—Civil Engineering, Mechanical Engineering, Electrical Engineering, Mining, Naval Architecture, Chemistry, Metallurgy, Mathematics and Physics, Building, Textile Manufacture.

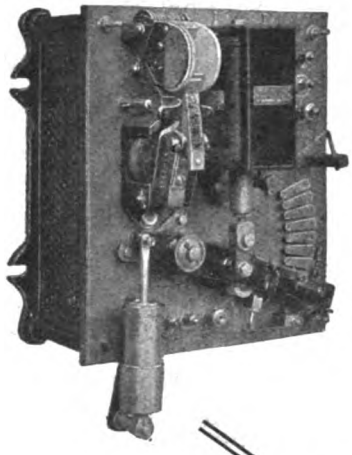
The courses of study for the Diploma usually extend over three sessions. The average fee per session is £12 12s. Holders of the Diploma are eligible for the Degree of B.Sc. in Engineering of the University of Glasgow after attendance for at least one session upon prescribed University classes. In conjunction with the Glasgow School of Art a Course for a Joint Diploma in Architecture has been arranged.

The preliminary examination for Candidates for the Diploma begins on September 19th. Names of Candidates must be lodged not later than September 1st.

New and well-equipped Laboratories have been provided in the Departments of Physics, Chemistry, Technical Chemistry, Dyeing, Metallurgy, Mechanics, Motive-Power Engineering, Electrical Engineering, Mining, Textile Manufacture, Biology, Bacteriology and Navigation, and facilities for research are afforded.

Calendar (price by post, 1s. 4d.) and Prospectus (gratis) will be sent on application to the Secretary.

SOUTH-WESTERN POLYTECHNIC INSTITUTE.



Manresa Road, Chelsea, London, S.W.

COMPLETE THREE YEARS' COURSE IN ELECTRICAL ENGINEERING is held during the day and a FOUR YEARS' COURSE in the evening. COURSES OF LECTURES and PRACTICAL WORK are given in the following subjects, which may be taken separately or as part of a Course :—

Elementary, Intermediate, and Advanced Electrical Engineering, Electrical Design, Instruments and Lamps, Alternating and Polyphase Currents, Electrical Wiring and Fitting (Lectures and Practical Work), Calculus for Engineers.

For particulars apply to the SECRETARY.

Edinburgh.

University of Edinburgh.

Students must pass an entrance examination, but "leaving certificates," issued by the Scottish Examination Department, may exempt candidates for the whole or part of the examinations. The degree of B.Sc. in engineering is obtainable after a course of two and a half years, but a considerable number of students take three and a half years. Eleven courses of study must be taken, six of which may be taken outside the University. Stress is laid upon laboratory work. Facilities for post graduate work are afforded, and graduates of five years standing may offer themselves for the degree of D.Sc. in Engineering. Prof. T. Hudson Beare is head of the engineering department.

Heriot Watt College.

The classes are in connection with the University. Arrangements with engineering firms permit students to work as apprentices from March to October in their second year, and to complete their apprenticeship after completion of the college course. Students must pass an elementary entrance examination or its equivalent. The course is from three to four years. Prof. F. G. Baily is professor of electrical engineering, and is assisted by six demonstrators. The laboratories have recently been extended. Fees from 15 to 20 guineas per year, or for complete training in five or six years, including apprenticeship premium, from £120 to £200. Evening classes are also held at the college.

Exeter.

University College.

Instruction in electrical engineering of a more or less elementary nature is given in the Engineering and Manual Training School of this college, in evening classes, by Mr. W. T. Dicker, of the City Electricity Department. The work of the class covers the syllabus for the certificate of the City and Guilds of London Institute. The fee for a course or group of subjects is 10s. per session.

Glasgow.

University of Glasgow.

In most cases the students work at the University during the winter session from October to March, and spend the remaining six months of the year in works. A candidate for the B.Sc. degree in engineering must attend at the University for not less than three years, taking certain courses of instruction, and passing certain prescribed examinations. Certificates of "Proficiency in Engineering Science" are also granted to students after a three years' course with examinations. Students who have obtained the diploma of the Glasgow and West of Scotland Technical College (see below) can obtain the B.Sc. degree in engineering after one year's attendance at the University, taking the necessary courses of study and passing prescribed examinations. Prof. Barr is professor of engineering, and Mr. J. S. Nicholson is lecturer in electrical engineering. The fees, including examinations, amount to from £20 to £25 per annum.

The Glasgow and West of Scotland Technical College.

A complete three years' course in electrical engineering is held at the Glasgow and West of Scotland Technical College, which qualifies for a college diploma and associateship in electrical engineering; the fees per session average £12 12s. Evening classes are also held. The professor of electrical engineering is Dr. Magnus Maclean, with whom are several assistants and lecturers. Candidates for the degree of B.Sc. in engineering of Glasgow University who hold the college diploma are admitted to the examinations for the degree after attendance for at least one academical year on prescribed University courses. Entering students must pass a preliminary examination. Considerable additions are about to be made to the already extensive laboratory equipment.

Leeds.

The University of Leeds.

The University of Leeds, which as the Yorkshire College was at one time a part of the Victoria University, with those of Liverpool and Manchester, but is now an independent organisation, contains an electrical engineering department, presided over by Prof. G. D. Aspinall Parr, assisted by several demonstrators. It is considered desirable that students should have some practical experience before taking the University course. The course qualifying for the degree of B.Sc. in electrical engineering covers three years, and can only be entered upon after passing the matriculation examination. The electrical engineering department students not entering for a degree can also take the regular three years' course, and in special cases a two years' course. The fee for the full course is about £30 per annum. Research students are admitted to the laboratories. An advanced evening course with laboratory work is also given.

Liverpool.

The University of Liverpool.

The course for the B.Eng. degree occupies three years. The M.Eng. degree is conferred on Bachelors of three years' standing, either on the passing of a further examination or the presentation of a dissertation upon an engineering subject. The degree of D.Eng. is conferred upon Masters of Engineering of a certain standing who are adjudged to have distinguished themselves by their original contributions to the science of engineering. A certificate in engineering and a diploma in engineering are also granted. Candidates up to the final ordinary degree have a general engineering training. Specialisation in the higher branches of electrical engineering can be done remaining a fourth year to attend the Honours School or to qualify for the M.Eng. degree. The fees for the ordinary course amount to about £26 per annum. The professor of electrical engineering is Dr. E. W. Marchant, and Mr. J. K. Catterson-Smith lectures in electrical engineering.

Municipal Technical School, Liverpool.

The electrical engineering department of the Central Technical School, Byrom Street, Liverpool, provides a course of work at low fees (in evening classes only), including laboratory work, extending over three years. The special instruction in electrical engineering is based chiefly on the syllabus of the City and Guilds Institute. There is a special systematic course of instruction for wiremen. Mr. J. Lloyd Barnes is lecturer in electrical engineering, and Messrs. J. M. Robertson and E. S. Francis, lecturers on telegraphy and telephony respectively.

Manchester.

The University of Manchester.

Engineering subjects may be taken to qualify for the ordinary B.Sc., or honours B.Sc. degrees of the University of Manchester. In the case of the honours degree, there is a regular three years' course, in which electrical engineering can be included. The matriculation examination is similar to that of other universities, and for the ordinary degree an intermediate examination must be passed as well. A further degree of M.Sc. is conferred on graduates of certain standing, who are required to present a thesis. Students who are not candidates for a degree may also take a three-years' engineering course similar to that for the honour B.Sc. in engineering, and qualify for a certificate in engineering. The professor of engineering is Dr. J. E. Petavel, F.R.S., but a part of the electrical engineering course comes under Dr. R. Beattie, who is attached to the Department of Physics. There is a well equipped electro-technical laboratory, and recent additions to the plant include a 100-h.p. Zoelly steam turbine and three-phase alternator. Opportunities for post graduate study and research are given, including special lectures on electrical power station management. The fee for the engineering course is about £30 per session, not including degree and examination fees. Students can reside at certain licensed halls of residence or in registered lodgings. The subject of electrochemistry is dealt with by Dr. R. S. Hutton and Dr. J. N. Pring, and there is a special electrochemical laboratory.

The Municipal School of Technology.

The Manchester Municipal School of Technology in Sackville Street is connected with the University of Manchester in that day students who have been through the courses there can qualify for Manchester degrees of Bachelor and Master of Technical Science (B.Sc. Tech. and M.Sc. Tech.). The School is under control of a joint Board, and virtually forms the Faculty of Technology of the University. There is a very complete special three years' course in electrical engineering, one feature of which is that it includes instruction in German. For those not taking the University degree an entrance examination is required instead of the University matriculation, and a Certificate of the University in technical science is given. The fees amount to twenty guineas for each complete session. The electrical engineering laboratories are very fully equipped. Mr. J. H. Reynolds is Principal. Students desirous of admission must be not less than sixteen

Digitized by Google

years of age, and must produce a satisfactory reference in respect of conduct and progress from the school previously attended.

Newcastle-on-Tyne: Armstrong College.

The Armstrong College, Newcastle, forms a part of the University of Durham, and students passing a matriculation examination, and taking a three or four years' course in electrical engineering can qualify for the Durham degree of B.Sc. A similar three years' course qualifies for a college diploma, or a second-class diploma can be obtained after a two years' course. The fees for either degree or diploma course are: First year, £21; second year, £26; and third year, £26. Laboratory fees are charged extra. The head of the electrical engineering department is Prof. W. M. Thornton, who is assisted by Mr. W. Firth. A feature of the college is the series of special Saturday classes, which include courses of electrical engineering, and other subjects for miners and colliery engineers. Evening classes are also held.

University College, Nottingham.

Special facilities for the study of electrical engineering are afforded at University College, Nottingham. The day courses are intended for boys who have just left school, but more advanced students can join the senior classes. The courses are arranged with regard to the requirements of the London University examinations. Students can combine the first year engineering course with the London matriculation course; the second-year course is suitable for the intermediate examination in science (engineering), and the third-year course is intended to prepare students for the B.Sc. degrees in engineering of the London University. No entrance examination is required, but intending students must satisfy the Professor of a general knowledge of English and elementary mathematics. The fees are £6 for each of the first three terms, and £3 3s. for the summer term, including all laboratory and workshop charges. Prof. W. Robinson is the head of the engineering department, and Mr. R. A. Sheldon and Mr. W. Inchley give instruction in electrical engineering.

The University of Sheffield.

The full three years' course in electrical engineering at Sheffield qualifies for the degree of Bachelor of Engineering (B.Eng.), but non-degree students are allowed to take the whole or any portion of the course. Those reading for the degree are required to pass a matriculation examination. The fees are about £25 per annum. A similar course qualifies for the Associateship in Engineering, which can also be obtained by evening students. A special course on electricity in mining is given, and the equipment of the metallurgical department includes two Kjellin electric furnaces. Prof. W. Ripper is professor of engineering, and Mr. E. H. Crapper lectures on electrical engineering.

The Technical College, Sunderland.

An important feature of the Technical College, Sunderland, is the arrangements which have been made for the granting every year of a certain number of "Apprenticeship Studentships," which entitle their holders to pass free of class fees through the three or four years' courses of study in the day classes of the College prescribed for the diploma of Associate of the college in electrical engineering. These students spend the summer months in the works, and attend classes, &c., during the winter. There are also evening courses, which include telegraphy and telephony. Mr. V. H. Mundella is the Principal, and Mr. W. T. Maccall is head of the electrical engineering department.

Some notes on the electrical engineering courses at the leading colleges and institutions of technical instruction in London will be given in our next issue.

L.C.C. Free Studentships.—In return for the grant of £8,000 made last year to the Imperial College of Science and Technology, South Kensington, the London County Council secures the privilege of nominating twenty-five students for one year's free instruction at the College. Only advanced students qualified to enter on the fourth year of the course should apply. There is no restriction as to income, but candidates must be resident in London, and must be students at an institution aided, maintained, or approved by the Council. There is no examination, and the studentships will be awarded on consideration of the past records of the candidates. In special cases, the studentships may be extended to two or more years. Entries for the studentships will be received until October 1st, 1910, and application forms (T.2/263) can be obtained from the Education Officer, London County Council, Victoria Embankment, London, W.C.

MUNICIPAL HOUSE WIRING

WE are now in a position to give some further particulars of the progress that has been made by the Incorporated Municipal Electrical Association in connection with the Bill to be promoted next session to give all local authorities power to carry on house wiring. On July 9th a preliminary inquiry was sent out to all local authorities who are members of the I.M.E.A., asking whether they would support a Bill to give all local authorities with electricity supply undertakings powers to wire houses, and also to sell or hire lamps and fittings, motors, &c., without tying their hands as to the employment of contractors for carrying out the work. It is also proposed that the Bill should deal with stand-by supply; as the Act of 1909 (Clause 15) now stands, public electricity supply works are relieved of the obligation to give a stand-by supply to premises with their own electricity works, but it is now proposed that this protection should be extended to those premises which are gas lighted. A provision in the Bill for further protection against unauthorised undertakers is also suggested.

The Electricity Committees of the following local authorities have agreed to support the Bill, and in many cases the matter has already been before the Councils themselves, who have endorsed the action of the Committee. In the list one or two local authorities are included who, although agreeing to support the Bill generally, are not desirous of supporting the wiring clause, chiefly because they already have powers; one or two others, we believe (Middlesbrough, for instance, as already reported in our columns), have so far only consented to give their moral but not their financial support.

Barnes, Barrow-in-Furness, Birkenhead, Bolton, Brighton, Bury, Blackpool, Bradford, Cardiff, Coventry, Croydon, Colne, Canterbury, Carlisle, Dartford, Devonport, Darlington, Dewsbury, Eastbourne, Eccles, Exeter, Fulham, Falkirk, Gillingham, Hackney, Hastings, Hull, Ilkeston, Ilford, Keighley, Loughborough, Londonderry, Lincoln, Maidstone, Middlesbrough, Peterborough, Portsmouth, Rochdale, Sheffield, St. Marylebone, St. Helens, Swindon, Southend-on-Sea, Shipley, Taunton, Walsall, West Bromwich, West Ham, Wigan, Wimbledon, Warrington.

It is seen that the above list already includes a number of large towns, and when the Electricity Committee meetings resume their normal frequency and activity after the holiday season there is no doubt that the number of supporters of the Bill will be greatly increased. There are signs of corresponding activity among the wiring contractors in certain districts, and it may be anticipated that the fight will be a severe one. Among those local authorities who have decided not to support the Bill are Oldham, Stoke-on-Trent, and Tunbridge Wells. At Dundee there is already a keen fight between the contractors and the electricity department, and the consideration of the matter in the Council has been postponed until next month.

Gun Explosion at Portsmouth.—On Thursday last a Sergeant of the Royal Garrison Artillery was killed by a gun explosion at the Spitbank Fort, Portsmouth, and a gunner was severely injured. At the inquiry on Friday, it was elicited that a misfire with the 4·7 in. gun in question was reported early in the morning, and that the acting bombardier had tested the cells, the ignition circuit and the primer in the cartridge that had misfired, and had found the bridge of the primer to be broken. A new primer was obtained and the gun reloaded, and the Sergeant proceeded to test the circuit with the breech of the gun open, which appears to be one of the recognised tests. It seems that while doing this the Sergeant accidentally touched the primer with a wire with which he was testing the circuit, with the result that the cartridge was exploded. The coroner suggested that steps should be taken by the military authorities to prevent similar accidents, and a verdict of accidental death was returned.

Digitized by Google

CATALOGUES AND PAMPHLETS RECEIVED

ADVERTISING LITERATURE.—The electricity supply department of the Borough of St. Marylebone have issued a pamphlet entitled, "Gas *v.* Electricity for Health and Pure Air." This consists of a number of extracts from the 1909 reports of H.M. Inspectors of Factories, commenting on the better atmosphere resulting from the substitution of electricity for gas lighting, and referring to the dangers of flueless gas stoves.

STORAGE BATTERY ACCESSORIES.—A leaflet from S. Heilpern (82 Hamilton Road, Longsight, Manchester), gives particulars and prices of the "Unica" sediment pump for lifting lead sediment and foreign matter from the bottom of storage battery cells while the cells are in use. This firm also supplies water distilling apparatus and electrical instruments.

CABLES, WIRE, AND TAPE.—A card with humorous drawings illustrating the use of St. Helens cables in a mine in prehistoric days, and calling attention to various other manufactures of the firm, is to hand from the St. Helens Cable & Rubber Co., Ltd. (Warrington).

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

INSULATING VARNISHES.—A list is to hand from Chas. H. Blume (White Building, Fitzalan Square, Sheffield), covering insulating varnishes, japans, and enamels, manufactured at the Mitcham works of this firm in Surrey. Among the specialities listed are various grades of stoving and air-drying varnishes, mica sticking varnishes for building up micanite, core-plate varnish, acid-resisting enamel for wood and metal-work in battery rooms, machine fillings and enamels, slate enamels, and lacquers of all descriptions. A very low moisture absorption is claimed for the insulating varnishes; after 200 hours' exposure of a test cloth impregnated with a stoving varnish, the absorption of moisture was only 1·2 per cent.

ELECTRIC CAPSTANS.—A booklet is to hand from Messrs. Bruce Peebles & Co., Ltd. (Edinburgh), describing the "Clyde" electric capstans constructed under the patents of Dixon and Baxter. These capstans have been in successful use for many years, and embody a number of special features, the chief being that the head is not fixed to the spindle, but is driven through a clutch. This enables a fixed rope to be used, practically eliminating the wear on the head and increasing the life of the ropes, and is claimed to effect some 25 per cent. saving in energy consumption, as well as a 50 per cent. reduction of the maximum demand of the motor. Some sectional drawings and a photograph of the device are given in the booklet, together with some test figures.

CARBON BRUSHES.—A booklet is to hand from Messrs. Krupka & Jacoby (11 Queen Victoria Street, London) giving particulars and prices of carbon brushes manufactured at Dr. A. C. Lessing's works in Germany. A very large variety of shapes and compositions is listed, suitable for current-densities of from 40 to 250 amperes per square inch. Brushes for the higher densities contain a very high percentage of copper, and are suitable for slip-rings.

METERS.—Messrs. Siemens Bros.' Dynamo Works, Ltd. (Supplies Dept., 39 Upper Thames Street, London), have sent us a booklet giving instructions for the use of the Siemens "G 4" type meters. These are intended for use on two- or three-wire D.C. or A.C. systems, and for currents up to 200 amperes, and pressures up to 650 volts. The cyclometer dials register B.O.T. units. All the working parts of this meter can be replaced without special tools, and it is stated that the replacement of any worn or damaged part does not necessitate recalibration. The booklet contains diagrams of connections, photographs illustrating the renewal of parts, and full instructions for using, overhauling, and testing these meters.

SWITCHGEAR.—A leaflet is to hand from the A.E.G. Electric Co., Ltd. (121 Charing Cross Road, London, W.C.), with an illustration of a large wagon-type high-tension switch-panel. When the switch is in the "off" position, the wagon can be withdrawn from its chamber, completely isolating the gear from the 'bus-bars.

D.C. MOTORS AND GENERATORS.—The British Thomson-Houston Co., Ltd. (Rugby), have issued a new price list of Type D.G. continuous-current motors and generators. A design of pipe-ventilated dust-proof motor is included. This has a flange fitted to the motor case for connection to an air-duct, through which a supply of clean, dust-free air can be drawn. Motors of this pattern are particularly suitable for driving machine-tools, paint-mixing machines, pumps, wood-working machines, and coal-hoists, where the motor would be subject to dust or water.

SEWING-MACHINE MOTORS.—Another list from the B.T.-H. Co. gives particulars and prices of small sewing-machine motors for continuous and alternating current. These are of 1-30 to 1-40 h.p., and have speeds of from 1,500 to 2,400 r.p.m.

LOCAL NOTES

ARGENTINE.—The *Review of the River Plate* states, in a statistical note upon the imports during 1908, that of dynamos and motors, 48 per cent. came from Great Britain, 30 per cent. from Germany, and 11 per cent. from the United States. Of "electrical goods," 45 per cent. were British and 34 per cent. German.

BACUP: *Tramways.*—The Town Clerk of Bacup has received an intimation from the Board of Trade confirming the order for a new electric tramway from Bacup to Shawforth, which will link up the system to Rochdale.

BIRKENHEAD: *Tramway Accounts.*—The receipts for the past year amounted to £55,754, an increase of £602 over the previous year, and the working expenses were £33,756, a decrease of £1,675. The net profit is £1,832, against the previous year's loss of £407.

BRIERFIELD: *Tramways.*—At the Brierfield Council meeting on August 11th, Councillor Walmsley mentioned that the tramways agreement with Burnley was now settled, and only required signing.

BUENOS AIRES: *Proposed Tube Railway.*—According to the *Review of the River Plate*, the Buenos Aires Western Railway has approached Congress in connection with its concession for a tube between the Once and the Port. It is now proposed that this tube should be for freight only and that the passenger traffic should be diverted to the tube to be constructed by the Anglo-Argentine Tramway Co.

CHILE.—A concession has been granted to Mr. O. L. McDermott for the construction of an electric railway from Antosagasta to Mejillones.

DENMARK: *Jutland.*—According to a Consular report, large electric works are projected in the district between Aarhus and Randers.

HASLINGDEN: *Tramway Supply.*—An agreement has been sanctioned under which the Haslingden Electricity and Tramways Committee will be supplied by the Accrington Corporation, from August of next year, with electricity in bulk. Accrington are petitioning the Board of Trade for their sanction of the scheme, Haslingden to obtain borrowing powers to place themselves in a position to receive the current and to resell to consumers in their own borough.

JAPAN: *The Floods.*—A Reuter's telegram states that the floods in the Tokyo district are causing the failure of the gas and electric light services.

KILMARNOCK: *Electricity Accounts.*—The annual report records a net profit on the electricity undertaking of £401.

LEEDS: *Tramways.*—The Leeds tramway system is to be extended to Morley by an agreement between the two Corporations.

LONDON: "*Big Ben.*"—During the present vacation the opportunity is to be taken to put in an electric motor to drive the winding gear, which is at present worked by hand.

London United Tramways.—A new system of fares has been inaugurated during the week. The routes have been divided up into sections, any consecutive three of which may be traversed for a penny, six for twopence, and so on. If a traveller goes beyond the third section and does not pass the fourth, only an extra halfpenny will be demanded, whereas before a penny was charged.

PENZANCE: *Electric Lighting Scheme.*—It is reported that the Board of Trade are to be asked not to take any steps to revoke the electric lighting order, provided the undertakers are able to show by Christmas next that they are in a position to carry it out.

PERTH: *Electricity Accounts.*—The total revenue for the past year amounted to £7,935, and after meeting capital charges a balance of £67 has been carried forward. After considerable discussion it has been decided to reduce the price charged for current to the tramway department, which will now be at the rate of 1·12d. per unit instead of 1·29d.

RAWTENSTALL: *Tramways.*—The Town Council have received sanction to lay a new line from Waterfoot to Water. Last year there was a loss on the Rawtenstall tramways of £2,196, including £1,146 paid for a tram accident which occurred in December, 1908.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Aug. 11th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

14,212/09. **Battery Boosters for Three-wire Battery Installations.** A. M. Taylor. Instead of having two separate booster armatures, connected to the two sides of the system, a single booster of double the voltage is employed. This has slip-rings connected to two tappings on its armature winding, and these are connected to a choking coil or balancer to give the neutral point and to compensate automatically for fluctuations in the out-of-balance current. Further, where two boosters are arranged for series-parallel grouping, the neutral point is obtained by similar static balancers. The balancers also protect the boosters from undue rushes of current due to external short circuit. Three figures.

16,621/09. **Current Indicator for Electric Speed Indicating Apparatus.** J. Rennie. This instrument consists of a compound strip of brass and iron loosely coiled up and fixed at the outer end, the inner end having a pointer attached to it. When heated up by the current, the strip uncoils and moves the pointer. The scale is attached to a second strip, which, by moving the scale, compensates for atmospheric temperature variations. A contact placed on the scale causes a bell to ring when the pointer reaches it. For use with a speed indicator, the current generated by a small dynamo is passed through the strip. Four figures.

17,031/09. **Balanced Protective Arrangement for Three-phase Distribution Systems.** British Thomson-Houston Co., Ltd., and E. B. Wedmore. This specification covers the system of balanced protection described with the results of tests in Electrical Engineering, June 2nd, 1910, p. 356. Three figures.

19,623/09. **Illuminated Signs.** W. P. Thompson (*Hamburger Elektricitäts Ges.*) Letters or designs cut out in rough gold leaf are pasted on to a dark concave opaque surface, and an electric lamp is fixed at the optical centre of the surface. The lamp is shaded from the observer, and the letters have the appearance of being self-luminous. A sign may be made up of a large number of such concave surfaces, each having a lamp at its optical centre, and containing one letter or design. Four figures.

20,106/09. **Joint Boxes for Aluminium and Copper Cables.** C. J. Beaver and E. A. Claremont (Manchester). This is a box for enclosing and protecting a mechanical joint between overhead cables of copper and aluminium respectively, to prevent electrolytic action. The mechanical connector is of copper or aluminium, and over the end engaging with the cable of unlike metal is fixed a metal shell. A bush of a non-metallic material is inserted between the neck of the shell and the cable, and the shell is filled with a bitumen or wax compound. All joints between dissimilar metals are thus protected from the atmosphere. Two figures.

20,666/09. **Lamp-shade Ring.** C. Arnold. A readily fixed and simple ring for fixing shades on lamp-holders consists of a ring with two or more springs converging inwardly upwards so as to grip the threaded part of the holder. The springs are bent out again so as to form a support for the shade. Ring and springs may be in one piece, or the springs can be riveted to the ring. There is no screwing motion, the holder being merely gripped by the springs. Two figures.

24,269/09. **Control of Induction Motors.** Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke Ges.*). For the speed control of a large polyphase induction motor, a frequency-transformer is employed to supply a current of variable frequency to the rotor. This transformer consists of an induction motor coupled to a polyphase commutator machine with slip-rings. The slip-rings of the induction motor are connected to the three brushes of the commutator machine which supply the variable frequency current, and the speed of the set depends on the frequency of the currents generated. Two figures.

3,981/10. **Drawn Tungsten Filaments.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). In order to pass a tungsten rod or wire into the die for drawing, it must be pointed at the end. The metal is exceedingly hard, and so, to effect this, the wire is dipped into a bath of a fused oxidising salt such as potassium or sodium nitrite. The chemical action points the wire and leaves a clean surface free from pits.

5,801/10. **Electrically Operated Switch.** Adams Manufacturing Co., Ltd. (*Cutler Hammer Manufacturing Co., U.S.A.*). This is a circuit-breaker of the "contactor remote control" type described in Electrical Engineering, April 14th, 1910, p. 247. In order to permit access to the contacts of the switch, the pole-pieces of the blow-out magnet are swung aside. Thus the pole-pieces may be constructed in one piece with the core of the blow-out magnet, and the core may be arranged to turn in its bobbin. Eight figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.
Summaries of some of the more important of these patents will appear in our next issue.

Dynamos, Motors, Transformers: Holmes [Induction motor] 17,520/09; Leitner [Train-lighting dynamos] 17,847/09 and 8,219/10; Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke Ges.*) [Starting of polyphase motors] 7,822/10 and [Compensated polyphase series motor] 9,046/10.

Electric Ignition: Dier and Whitcher [Electric gas lighter] 25,574/09; Smith [Sparking-plugs] 9,618/10.

Electrometallurgy and Electrochemistry: Cowper Coles [Reflectors] 20,017/09; Helfenstein [Electric reduction furnaces] 24,498/09; New Ignition Syndicate and Sandy [Battery electrolyte] 26,649/09.

Incandescent Lamps: Redfern (*Compagnie Générale d'Electricité*) [Apparatus for jointing filaments] 25,383/09; Krause [Supports for metal filaments] 349/10.

Instruments and Meters: Berardi [Prevention of fraud with meters] 17,488/09; Hamilton and Ferranti, Ltd. [Counting trains for meters] 18,691/09.

Storage Batteries: Lewis, 18,098/09; De Laminière and Soc. Anon. des Accumulateurs de Laminière [Plates] 27,976/09.

Switchgear, Fuses, and Fittings: Fisher [Plugs] 12,452/09; Wardle Engineering Co. and Wardle [Lamp fittings] 17,230/09; Schultz [Switches] 17,274/09; Tucker [Switches] 18,471/09; Kohler [A.-C. motor controllers] 21,249/09; Rockstroh [Control gear for electrically-driven printing and stamping machinery] 4,678/10; Midgley and Vandervell [Switches] 5,571/10; Lundberg [Switches] 10,423/10.

Telephony and Telegraphy: Eisenstein [Wireless aerial] 17,215/09; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Signalling apparatus] 7,154/10.

Traction: Heenan & Froude, Ltd. [Radial trucks] 18,390/09; La Barre [Stopping trains independently of drivers] 21,666/09.

Miscellaneous: Pealing [Portable electric drill] 11,858/09; Brougham (*A.-G. Maschinenfabriken Escher, Wyss*) [Exhaust-steam plants] 17,475/09; Steinert and Stein [Electromagnetic separator] 17,490/09; Heurtley [Electrical magnification of mechanical effects] 17,555/09; Brown and Scott [Reversible turbine] 28,931/09; Wooton and Howett [Fire alarms] 7,820/10; Verhoeven [Burglar alarm] 11,254/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: Siemens Schuckertwerke Ges. [Electric speed regulation of machines] 16,997/10.

Electric Ignition: R. Bosch, 14,575/10.

Switchgear, &c.: R. Bosch [Terminals] 11,600/10; Siemens Schuckertwerke Ges. [Fuses] 17,047/10; Allgemeine Elektricitäts-Ges. [Signalling apparatus] 17,156/10; Bonhomme [Signalling apparatus] 17,172/10.

Traction: Jellinek and De Továros [Suspension of trolley wires] 8,831/10.

Miscellaneous: A.-G. Brown, Boveri, et Cie. [Turbine blades] 28,140/09.

Opposition to Grant of Patent

19,872/09. **Electrical Propulsion of Ships.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). Opposition has been entered to the grant of this patent. The specification, abstracted in Electrical Engineering, June 23rd, p. 415, describes a system combining electrical drive with motors supplied by high-speed turbo-alternators and direct drive with low-speed, low-pressure turbines.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

18,617 of August 22nd, 1896. **Copper Brushes.** F. J. Chaplin. This covers dynamo brushes formed by folding two sheets of copper-wire gauze, the outer sheet being cut diagonally to the wires, while the inner sheet is cut on the straight.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: A. Blondel [Ventilation of flame lamps] 9,316/03.

Distribution Systems, &c.: L. Randolph [Insulating composition] 9,511/02; E. R. Hill [Balanced protection system for H.-T. feeders] 8,906/05.

Instruments, &c.: W. D. Watson and Rochdale Electric Co. [Prepayment meter] 9,657/03.

Switchgear, &c.: C. L. Menges [Lamp-holders and wall-plugs] 9,728/03; J. H. Dale [Lamp cluster fitting] 9,397/04.

Telephony: E. N. Baird [Prepayment apparatus] 2,238/01.

Miscellaneous: J. B. Bessey [Electrical treatment of peat fuel] 17,497/04.

Digitized by Google

STAFFORDSHIRE: *Abandonment of the "Fair Fare" System.*—In consequence of local opposition, the Potteries Electric Traction Co. has decided to abandon the "fair fare" system, with its farthing fares, from September 1st.

STALYBRIDGE: *Electricity Costs.*—It is announced that the Works costs have averaged 0·33d. per unit, which is considerably below the average of undertakings in this country. The average selling price has been 0·59d., including a large supply for power purposes. The units consumed per head of population worked out at 102·7, which is said to be a record for this country.

STOCKHOLM: *Trolley Omnibuses.*—It is stated that the municipal authorities have granted a concession to a private syndicate for a service of accumulator and trolley electric omnibuses.

TAUNTON: *The Borough Electrical Engineer.*—Eighty-two applications have been received for the vacant post of Borough Electrical Engineer at a salary of £200 a year.

WEYMOUTH: *Tramway Propositions.*—The Council have had under consideration a report of the Electric Lighting Committee on several alternative traction schemes, embracing propositions for services of petrol, petrol-electric accumulator, and trolley omnibuses, and electric tramways. The Committee favour the tramways scheme, which they think could be made to pay if the capital costs are kept to a minimum. It would also provide a valuable day load to the electricity works. It is recommended that a Provisional Order be applied for at once.

WIGAN: *The Tramway Undertaking.*—An extensive report on the tramway system has been prepared by Mr. C. W. Mallins (General Manager, Liverpool Corporation Tramways), who recommends: (1) The appointment of a general manager, responsible to the Tramways Committee for the whole undertaking, with the possible exception of the permanent way; (2) that the maintenance charge on overhead equipment, rolling stock, car sheds, and workshops should be reduced to the average; (3) that the cost of electric current be reduced to the average of tramway undertakings; (4) the cost of maintenance of permanent way reduced to the average; (5) an improved service; (6) a system of through running; (7) the contract for advertising on the cars to be looked into, as to whether better terms could be arranged; (8) a rearrangement of the present stages and fares; (9) a more up-to-date type of rolling stock; (10) that standard gauge be substituted for the narrow gauge portions.

WOLVERHAMPTON: *Tramway Accident.*—On Monday some excitement was caused by one of the feeder cables breaking down to earth at the base of a feeder pillar and producing dense volumes of smoke, which poured out of the ventilating holes at the top of the pillar. A tramcar happened to be standing by, and a panic appears to have been started, in which one man jumped from the top of the car into the road and sprained his ankle, and another man was pushed off the top and somewhat shaken. The traffic was delayed about half an hour while temporary connections were being made.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

CANADA: *Winnipeg.*—Tenders are required by September 1st for 46,000 ft. of 13,000-volt three-core cable. Particulars can be obtained from the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

CREWE.—Mains extensions amounting to £1,300 are to be made.

IPSWICH.—Tenders are invited for the annual contract for underground cables. Tenders by August 22nd. Particulars from Chief Engineer; deposit, one guinea.

ITALY.—It is reported that owing to the increase of traffic on the Milan-Varese Electric Railway, a number of new electric locomotives are to be purchased.

LONDON: *Hackney.*—Tenders are invited for extensions to the main switchboard. Tenders by August 22nd. Particulars from Town Clerk, Town Hall, Mare Street.

MISCELLANEOUS

LONDON.—Tenders for a year's supply of electrical accessories are invited by the Commissioners of H.M. Works and Public Buildings. Tenders by August 24th. Particulars from the Storekeeper, H.M. Office of Works, Engineer's Stores, 20 Newington Butts, S.E.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.

S.W.—Houses and shops, Foulser Road, Upper Tooting, S.W. Swain & Selley, builders, 31 Grayswood Street, Streatham.

PROVINCES.

ABERDARE.—School (£13,154). Architect, J. H. Phillips, 7 Pembroke Terrace, Cardiff. T. F. Howells, builder, Cardiff.

ABERDEEN.—Extension tramway depôt (£1,625). Borough Surveyor, Aberdeen T.C.

BARROW.—Fire station, Abbey Road, and Clifford Street (£2,380). J. W. Smith, surveyor, Barrow T.C.

BOLTON.—Additions Spinners Hall (£5,000). Architects, Potts & Sons, 79 George Street, Bolton. Builders, Townson & Sons, Bolton.

COLWYN BAY.—The electrical lighting of the Eisteddfod Pavilion has been decided upon, and cable, &c., is to be ordered forthwith.

DAILSTONE.—Additions hospital (£16,000). J. Jepson, Guardian Chambers, Tiviot Dale, Stockport.

DANTHILL.—Textile works, Caroline Street (£12,000). S. Stott, architect, York Chambers, Oldham.

GLASGOW.—Masonic temple, Cochrane Street. Architects, Lennox & MacMath, 103 Bath Street, Glasgow.

GOOLE.—Extensions workhouse (£3,700). Thorpe & Turner, architects, Carlisle Street, Goole.

HYDE.—A proposal to install electric light in the borough infectious hospital has been approved by the Council, subject to the Joint Electricity Board supplying electricity upon satisfactory terms.

NEWBURN-ON-TYNE.—Council chamber (£2,700). C. Cratne, architect, Station Road, Wallsend. Builder, T. Clemens, Grosvenor Road, Newcastle.

PORTSMOUTH.—Parish hall and Sunday school, St. Mark's Church (£3,197). Rake & Cogswell, architects, Portsmouth. Messrs. Salter, builders, Portsmouth.

POWERSCOURT.—Carnegie library. Surveyor, Rathdown (Dublin), No. 2, R.D. Council.

RENFREW.—Council offices, Yoker Road (£2,000). Surveyor, Renfrew P.C.

ROMFORD.—School (£5,567). Builders, Dowsing & Davies, Mawney's Road, Romford.

ROTHERHAM.—Smallpox hospital, Kimberworth (£6,000). Surveyor, Rotherham Town Council.

SHILDON (Durham).—School (£16,000). M. Turnball, surveyor, Shildon U.D.C.

YARMOUTH.—Pavilion, Britannia Pier for the Britannia Pier Co., Ltd.

TENDERS RECEIVED AND ACCEPTED

BELFAST.—The Harbour Commissioners have accepted the tenders of J. Howden & Co. for a steam engine (£224), and Siemens Brothers Dynamo Works, Ltd., for a dynamo (£331).

EDINBURGH.—The tender of Messrs. A. W. Penrose & Co. for electric lifts in the new General Post Office at Edinburgh has been accepted.

MIDDLESBROUGH.—A contract has been placed by Messrs. Dorman, Long & Co. with the A. E. G. Co. for a complete generating plant, including three mixed-pressure turbo-alternators, and one live steam turbine each of 1,280 kw. The exhaust steam turbines will be driven by steam from three large steam rolling mills.

MOTHERWELL.—The following tenders have been accepted:—Chamberlain & Hookham, meters; Balcke & Co., cooling tower (£818); Callendar's Cable & Construction Co., cables (£530); Siemens Brothers Dynamo Works, switchboard extensions (£305).

SWANSEA.—Messrs. C. H. Musker & Co. have received an order for three electric transporters for the new King's Dock (£4,100).

WHITEHAVEN.—The tender of Messrs. Browett, Lindley & Co. for a 250-kw. generating set with Phœnix dynamo has been accepted.

Digitized by Google

APPOINTMENTS AND PERSONAL NOTES

Mr. W. Perren Maycock, who has recently completed an eighteen-months' engagement with the International Correspondence Schools, Kingsway, London, is now engaged upon a new edition of his "Electric Wiring, Fittings, Switches, and Lamps," which, as well as another on a kindred subject, will be published before Christmas.

The Governors of Faraday House have appointed Mr. E. A. Nash as Secretary and Business Manager of the Electrical Standardising, Testing & Training Institution in the place of Mr. Howard Foulds, who has recently secured an appointment in Birmingham.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire-bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 5s. to £58 10s. per ton (last week, £58 to £58 5s.).

BRANCH OFFICES.—Messrs. Arthur Jopling & Co., 10 Westmorland Buildings, Aldersgate Street, London, E.C., inform us that they have opened a branch office at 16 Park Place, Leeds, where a complete stock will be kept. Mr. A. A. Pyman has been appointed manager for the district.

THE WITTON-JAMES SYSTEM OF PRINTING-PRESS CONTROL.—We are informed that this business has been purchased by Witton-James, Ltd., with a view to further development and extension. The new business will be under the management of Mr. H. V. James, as before, and the new address is Witton-James, Ltd., Midland Bank Chambers, Queen Victoria Street, E.C.

CHANGE OF ADDRESS.—Messrs. Grindlay, Ross & Co. (278 St. Vincent Street, Glasgow) have removed their works and offices to more commodious premises at 47 Waterloo Street. (Telephone No. Central 4593, and Argyle (Nat.) 2173.)

PARTNERSHIP DISSOLVED.—The partnership between Henry W. Davis and Harry W. Hosier, trading as H. & W. Davis, surgical and electrical instrument makers, of 43 Grafton Street, Tottenham Court Road, has been dissolved as from July 16th. Debts by H. W. Davis, who will continue the business.

The partnership between K. W. Bacher, H. C. Taylor, and S. R. F. Smith, electrical engineers, trading as Middlesex Electric Works, Hounslow, has been dissolved.

BANKRUPTCIES.—The discharge of Albert Clapham, of the Yorkshire Motor Car & Electrical Engineering Co., 101 Kirkstall Road, Leeds, has been suspended for two years.

METAL FILAMENT LAMP PATENTS.—We have been requested by the London Commercial Electrical Stores, 65 and 67 Knightrider Street, E.C., to state that the metal filament lamps which they sell are made under the colloid patents, and that they indemnify customers against any legal proceedings.

BRUSSELS EXHIBITION FIRE.—Among the many exhibitors who have suffered in the disastrous fire is the Synchronome Company, of Clerkenwell, who had equipped the whole of the British Section with their system of electric clocks. We are informed that their loss is not covered by insurance.

THE FIRE AT THE BRUSSELS EXHIBITION.—In the first reports of the disastrous fire at the Brussels Exhibition the outbreak was attributed to a short-circuit in an illuminated device over the Attic portico at the entrance to the Belgian section, burning portions of which were said to have fallen into the Salon of Belgian Needlework. In later reports, however, it is stated that an attendant certifies to having seen a curtain flare up in the needlework hall. A *Times* correspondent learns "from an authoritative source" that a night watchman has admitted that he involuntarily caused the fire when lighting his pipe. M. Beernaert, Minister of State, in an interview with the *Journal de Bruxelles*, stated that the fire was not due to a short-circuit. The whole of the British Section has been destroyed, but those of the engineering and electrical exhibits that were in the Machinery Hall have not been damaged.

Street Lighting at Finsbury.—With reference to an announcement in a contemporary that the Finsbury Borough Council has granted a contract for the lighting of all its streets by gas, and that this decision was taken after the latest examples of gas and electric lighting had been carefully inspected, and relative costs considered, Mr. H. B. Renwick (General Manager and Secretary, County of London Electric Supply Co., Ltd.) calls our attention to a letter which he has written to the journal in question, pointing out that his company offered to submit examples of electric lighting free of expense to the Council, but this offer was declined. With regard to the question of relative running costs, the company submitted a tender for lighting which gave an illuminating power three times as great as the existing gas lighting, and, moreover, showed a saving in running costs as compared with gas of over 14 per cent. In spite of this, however, he writes, the offer was declined.

NEW COMPANIES

G. W. CLARKE & CO. (LIVERPOOL).—Capital, £1,000 (250 deferred shares). To take over the Liverpool branch of the Walsall Electrical Co., Ltd.

ELECTRIC FURNACES AND SMELTERS, 110 Cannon Street, London. Capital, £5,000. Manufacturers of electrical furnaces for smelting.

HIGH-SPEED PRINTING TELEGRAPH CO., 10 Walbrook, London, E.C. Capital, £2,000. Objects as title.

PICKFORD, TROWN & CO., 264 Ecclesall Road, Sheffield. Capital, £3,000. To acquire the business of electrical and mechanical engineers now carried on at the above address.

BRACUHY FALLS & METALLURGICAL SYNDICATE. Registered by Slaughter & May, 68 Austin Friars, London, E.C. Capital, £48,000. Promoters, constructors, and makers of tramways, railways, telegraph and telephone lines, electrical works, &c.

JOHNSON BILLINGTON ELECTRICITY METERS.—Registered by Beddle & Co., 22 Aldermanbury, London. Capital, £8,000. To manufacture and supply meters of all kinds, and to adopt an agreement with A. M. Billington, and H. S. Johnson.

GREENHILL & CRAIG, 29-37 King Street, Belfast. Capital £6,000. Electrical engineers and machinists.

HORSE-POWER & SMELTING SYNDICATE.—This company was registered on July 29th with a capital of £12,000, to carry on the business of manufacturers of dealers in machinery for the treatment of ores and the generating of electricity, &c. Private company. Registered by Ingle Holmes, Sons & Pott, Capel House, E.C.

T. F. SYNDICATE, LTD., 341-5 Birkbeck Bank Buildings, High Holborn, W. Capital £2,000. Manufacturers of and dealers in metallic filaments, &c. To adopt an agreement with the Deutsche Gluhfahden Fabrik, of Berlin, R. Kurtz, and Dr. F. Eimer, and the Co-operative Commercial Concessions, Ltd., of 341-5 Birkbeck Bank Buildings, W.C. Private company.

LUMINATOR WATER CO. (FOREIGN PATENTS), LTD. (111,214.) Capital £5,000. Engineers, electricians, &c. Private company. Registered by Mayo, Elder & Co., 10 Drapers Gardens, E.C.

BRYANT & SONS, 42 Queen Anne Road, St. Philips, Bristol. Capital of £3,000. Electrical mechanical engineers. To take over the business of E. T. Bryant at same address. Private company.

GEM ELECTRICAL PICTURE CO., LTD., Public Hall, Burnley Road, Bacup. Capital of £500. Proprietors and managers of electric or cinematograph halls, &c.

SALERNO SYNDICATE, LTD., Cross Keys House, Moorgate Street, E.C.—Capital £8,300, shares of 1s. each, to obtain concessions, and to work railways, tramways, &c., in the province of Salerno, Italy. Private company.

ORIZABA TRAMWAYS SYND.—Capital of £3,150. Private company. Registered by J. J. Edwards & Co., 28 Sackville Street, W.

Association of Mining Electrical Engineers.—The annual meeting of this Association has been arranged to be held at Newcastle-on-Tyne on October 7th and 8th next.

New Power Station in South Africa.—According to the *African World and Cape-Cairo Express*, the Rosherville Lake power station of the Rand Mines Power Supply Co. (formed and financed by the Victoria Falls & Transvaal Power Co.) will probably be in operation in December next. When completed, this station will be the largest steam-turbine station in the world, the capacity of the plant being 106,000 h.p. The steel constructional work, comprising 1,800 tons of steel, supplied from Berlin, has been carried out by Messrs. Baerecke & Klendgen, of Johannesburg. A Johannesburg firm secured the contract for the foundations and brickwork, and the machinery is being supplied by the Allgemeine Elektricitäts Gesellschaft, of Berlin, who are the main contractors for the whole station. There are three boiler houses with eight boilers in each, each rated at 3,000 h.p. There will be sixteen chimney stacks, each 80 ft. high, when the plant is complete. Messrs. Babcock & Wilcox have secured the contract for the whole of the boiler plant. In the engine house are five 12,500 k.v.a. turbo-alternators, generating at 5,700 volts, and four turbine-driven air-compressors, each delivering about 600 cubic metres of air at a pressure of 140 lbs. per sq. in. Pipe mains for the transmission of the compressed air and cables for the electric power are now being laid to the mines of the Eckstein and Rand Mines group.

COMPANIES' MEETINGS AND REPORTS

TYNESIDE TRAMWAYS CO.—The surplus of receipts over expenses for the half-year ended June 30th was £3,656, making, after deduction of debenture interest, &c., and with inclusion of £521 brought forward, an available balance of £3,144. It is proposed to pay a dividend of 1 per cent. on the ordinary shares after the provision of the 5 per cent. dividend on the preference shares, to transfer £900 to reserve, and to write off £330 from registration and formation expenses, carrying forward £643. Dr. T. Merz said, at the meeting last week, that the expenses had remained about the same, but there had been a slight increase in receipts.

NORTH METROPOLITAN TRAMWAYS.—The report and accounts mentioned in our last issue were adopted at the meeting last Thursday. Mr. James Devonshire, who presided, said that very little progress had been made in disposing of the assets of the company.

BARBADOES ELECTRIC SUPPLY CORPORATION.—At the statutory meeting on Thursday, Mr. L. W. Hawkins said that reports as to the demand for electrical energy were encouraging; a site had been secured for the works, and the greater part of the plant had been ordered.

LONDON STREET TRAMWAYS.—At an extraordinary meeting on Wednesday of last week, a resolution was passed in favour of returning a final 8s. per share to the shareholders. The company now comes to an end with the cessation of the lease of their lines to the North Metropolitan Tramways Co.

METROPOLITAN DISTRICT RAILWAY.—At the half-yearly meeting on Wednesday of last week, Sir George Gibb, who presided for the last time, owing to his appointment as chairman of the Road Board, announced that 36 million passengers had been carried, an increase of over three million over the previous half-year. The passenger receipts had shown an increase of £26,000, and the working expenses had been reduced by 3¼ per cent. The service of trains now reached 36 per hour during the busy time. The passenger receipts average 1·36d. per passenger. The chairman spoke enthusiastically of the progress made by the line and its future prospects. The report and accounts were adopted.

LONDON ELECTRIC RAILWAY.—The half-yearly meetings of the Great Northern, Piccadilly & Brompton; Charing Cross, Euston & Hampstead; and Baker Street & Waterloo Railway Companies, which are now to be amalgamated under the above title, were held contemporaneously last Thursday, when the reports summarised in our last issue were adopted. Sir George Gibb stated that the increase of receipts of the three lines aggregated £10,940 during the half-year under review. The dividends were announced in our last issue. The first meeting of the new company was held on the following day.

UNDERGROUND ELECTRIC RAILWAYS COMPANY OF LONDON.—The report states that the net revenue from investments and properties (including general interest), after deducting general expenses, amounted to £96,767, the net income from the operation of the power house was £45,416. The interest on £1,000,000 4 per cent. First Power House Debentures, and a proportion of commission, discount, and expenses incurred in connection with the issue, required £20,870, leaving a surplus from the power house of £24,546. The service of the £1,000,000 5 per cent. Prior Lien Bonds required £26,458. The service of the £2,818,700 4½ per cent. Bonds of 1933 required £67,120. The payment under the guarantee on Metropolitan District Railway Assented Extension Preference Stock amounted to £1,343, leaving a surplus over half-yearly charges of £26,392, which amount will be applied as follows:—Interest at the rate of 1 per cent. per annum on £4,928,050 6 per cent. Income Bonds of 1948, £24,640; income tax thereon, £1,437; balance to reserve applied in reduction of the accumulated revenue deficiencies, £315. The income from investments for the six months shows an increase of about 17 per cent. over that for the corresponding half-year of 1909. The amount paid under guarantee on Metropolitan District Railway Assented Extension Preference Stock only amounted to £1,343, as compared with £9,403 paid in previous half-years. The difference of £8,060 represents a dividend for six months ending June 30th last at the rate of 3 per cent. per annum payable by the Metropolitan District Railway Company on the 15th inst. in respect of the Preference Stock to which the guarantee of the Company refers. The traffic of the railway companies in which the company is interested is increasing satisfactorily. The gross earnings of the London United Tramways, Ltd., show an increase of £10,923, the operating expenses an increase of £10,566, and the net earnings an increase of £357 over the corresponding period of last year. The net output of electric energy from the Lots Road power house during the half-year was 63,627,200 kilowatt hours. Sir George S. Gibb has retired from the board of the company in consequence of his having accepted the chairmanship of the Road Board. The Right Hon. Lord George Hamilton has consented to act as deputy chairman of the company.

MERSEY RAILWAY.—The receipts for the last year have amounted to £21,457, as against £18,758 for the previous corresponding half-year. The balance to debit to net revenue is reduced to £11,821, against £18,414 a year ago.

MISCELLANEOUS CITY NOTES

SPRINGFIELD & JACKSONVILLE ELECTRIC RAILWAY CO.—An issue of $800,000 first mortgage 6 per cent. gold bonds is being made.

DIVIDENDS ANNOUNCED.—Mather & Platt, interim dividend at the rate of 10 per cent.—Crossley Brothers & Co., interim dividend at the rate of 4 per cent.—Silvertown Tramway, 1s. per share, and a bonus of 1s. per share.—W. T. Henley's Telegraph Works Co., Ltd., interim dividend on the preference shares at 4½ per cent., and on the ordinary shares at 10 per cent. for the half-year ended June 30th (payable September 1st).—Northampton Electric Light and Power Co., Ltd., 5 per cent. on preference shares and interim dividend at the same rate on ordinary shares.—Vickers, Son & Maxim, interim dividend 1s. per share.

HARPER ELECTRIC PIANO CO.—This company is to be wound up voluntarily. Mr. H. Wilson, of 23 Devereux Court, is appointed liquidator.

South African Institute of Electrical Engineers.—A gold medal has been offered for the best Paper read by a member of this Institute during the year ending December 31st, 1910, and a silver medal for the best Paper by a student member.

Wireless Telegraphy.—It is reported that the Marconi Wireless Telegraph Co. have made an offer to the Portuguese Government to establish wireless stations in all the colonies of Portugal on very favourable terms, and that the Portuguese Government is favourably disposed towards the proposal.

Porous Pot Accumulator.—Messrs. Richard Pape, Ltd. (Albion House, 59 New Oxford Street), write to inform us that although the porous pot accumulator described on page 519 of our issue of August 11th is manufactured under Mr. H. F. Joel's patents, Mr. Joel has parted with his rights to Messrs. Richard Pape, who hold the sole licence, both for manufacturing and selling these accumulators in the United Kingdom.

Railway Nationalisation.—According to the *Times*, at a meeting of the National Association for the Extension of Workmen's Trains and Trams, held on Friday in London, a resolution was carried protesting against "the slow progress made by the County Council in the construction and electrification of the London Tramways." Further, it was decided to make the nationalisation of the railways one of the objects of the Association.

Competition in Practical Telegraphy.—An international competition in practical telegraphy will be held in connection with the International Exhibition at Turin next year, which will include trials with Morse, Hughes, and Baudot instruments, which have to be deposited at the exhibition by August 22nd, 1911. Prizes will be awarded on the results of these trials. A code of regulations has been drawn up by the Italian Ministry of Posts and Telegraphs.

The Engineering and Machinery Exhibition.—The Marquis of Graham, C.V.O., will formally open the Naval, Mercantile Marine, and General Engineering and Machinery Exhibition at Olympia, London, on Sept. 1st. Special meetings of engineering societies will be held at Olympia as follows:—Sept. 6th, Junior Institution of Engineers; Sept. 14, Institute of Metals; Sept. 17th, Institute of Marine Engineers; Sept. 21st, Society of Engineers; Sept. 24th, Association of Engineers-in-Charge. Provision has been made for the admission of workshop parties, engineering and technical students, at reduced rates. The Exhibition will run from Sept. 1st to Sept. 26th, inclusive.

Telegraphic Traffic and Movements of Cable Ships.—The cable between Bonny and Duala, which was interrupted on the 3rd inst., was repaired on the 9th inst., but on the following day it again broke down. On the 15th inst., the cable between Hong Kong and Macao ceased working. The line between Rome and Constantinople has been repaired.—The c.s. *Faraday* has successfully completed two deep-sea repairs in over 2,000 fathoms, and is now returning to London. The c.s. *Mackay-Bennett*, of the Commercial Cable Co., has been occupied in recovering the abandoned portion of the Southern Cable of the company, which was diverted to Newfoundland. The recovered portion will, it is understood, be sent to England. The French c.s. *Amiral Caubet* did not leave port during July.

Rumoured Railway Electrification Scheme for the Manchester District.—There was a persistent rumour in Manchester that the Lancashire & Yorkshire and London & North-Western Railway Companies contemplated the electrical working of about 200 miles of line. It was stated that a joint committee of the London & North-Western, Lancashire & Yorkshire, and Great Central Railways had been formed to consider various schemes. It was said that the Lancashire & Yorkshire Railway had a scheme for converting their system in the Bury direction, the London & North-Western line from Manchester to Stockport was also mentioned, as well as the joint line of the Great Central and L. & N.W.R. to Altrincham. Later reports say that official denial has been given to the rumours, which may have arisen from some remarks of Sir Alexander Henderson at the Great Central meeting, when he stated that the conversion of the Manchester, South Junction, and Altrincham railway had been considered, although no decision had been arrived at.

SUMMARY

The fire at the Brussels Exhibition was not due to electrical causes, as was at first reported. The British exhibit is being reconstructed. (Page 546.)

At Marylebone, Hampstead, and Shoreditch, gas is to be entirely displaced by electricity for street lighting. The complete electric lighting of the Borough of St. Marylebone is expected to be complete by next month. In all cases the existing gas lanterns are made use of, and at Marylebone the cost of conversion, where mains existed, comes out to the low figure of £3 per post. The figure at Hampstead is £6 10s. per post, but more elaborate switching arrangements are in use there. (Page 547.)

We publish this week particulars of the courses in electrical engineering which are given in the leading University and other Colleges in London, in the same way as the provincial Colleges were dealt with in our last issue. (Page 549.)

An article by Mr. W. S. Burge discusses some of the disadvantages of the usual design of high-tension cellular switchboards, and proposes a system employing lead-covered cables and a special form of carriage-type selector switches. (Page 551.)

A new flame arc lamp of simple construction has been introduced. It is of the type in which one carbon rests at its tip on a refractory support, and feeds down by gravity as it is consumed. A double-carbon pattern burning 32 to 38 hours on one trim can be obtained. (Page 552.)

We have received two further letters from consulting electrical engineers expressing their disapproval of the rule that only corporate members of the Institution of Civil Engineers shall be admitted to the newly-formed Association of Consulting Engineers. (Page 553.)

Among the specifications published by the Patent Office on Thursday last was one by J. H. Holmes & Co., for a short-circuiting device for induction motors, in which the switch is held in the open position against the action of a spring during starting.—A train-lighting dynamo, in which the short-circuit currents caused by using broad brushes are utilised to reduce the main field on increased speed, is covered by H. Leitner.—E. von Lepel and the Gesellschaft für Drahtlose Telegraphie have both been granted British patents for oscillation generators of very similar construction in spite of opposition.—A patent by R. Scherl for gyroscopic apparatus suitable for mono-rail cars is opposed.—Three important patents relating to the Curtis steam turbine expire on Thursday next after the full life of fourteen years. (Page 554.)

Owing to a short-circuit in the standard of a tram-car at Blackburn, the framework became "alive," and two men were injured.—The East Ham School Medical Officer recommends electricity for school lighting.—A bonus system has been introduced on the Dundee

Digitized by Google

tramways, but this system has been condemned by the men at Accrington.—Manchester Ratepayers' Association has entered a protest against the Local Government Board granting a loan without an inquiry.—A new tramcar depôt, which has cost £22,700, has been opened at Oldham.—Ipswich electricity accounts show a profit of £1,080 for last year, but the tramway accounts show a deficit of £1,732. (Page 555.)

Switchboard extensions are required at Rawtenstall; mains at Hoylake and Ipswich; meters at Littleborough; condensing plant at Darlington; and coal storage and conveying plant at Carlisle.—Loans are to be taken up as follows:—Aldershot, £1,500; Bury St. Edmunds, £1,460; Heywood, £4,000; Stalybridge, £22,268.—Electrical stores are required by the Powell Duffryn Steam Coal Co., and telephone material by the Australian Government. (Page 556.)

Domestic Irons.—There are some interesting notes on electric flat-irons in the August issue of *Installation News*, published by Simplex Conduits, Ltd. The writer deprecates the practice of keeping irons light for the sake of economy in the power required to heat them. A six-pound iron, he says, should be loaded up from 450 to 500 watts. It is a fallacy to believe that a heavy iron makes the operator tired; the requisite pressure for the work in the case of a light iron (3 to 4 lbs.) has to be compensated for by muscular exertion.

Patent Office Vacancies.—An open competitive examination to fill vacancies in the staff of assistant examiners in the Patent Office will be held in London, commencing on September 26th next. The present number of vacancies is seven. Limits of age, 20 and 25. Particulars of the examination and forms of application, which must be sent in on or before September 1st, can be obtained from the Secretary, Civil Service Commission, Burlington Gardens, London, W.

Faraday House.—The August issue of the *Faraday House Journal* contains an article on the electrochemistry of the commercial production of aluminium and an illustrated description of some electrically-driven winding engines for mines. The list of students attending the courses at Faraday House and the movements and successes of old students will be of interest to many. A photograph of Mr. H. Foulds, who has resigned the position of Secretary to take up the post of Secretary to the Birmingham Electricity Supply Department, is also included.

Turin International Exhibition.—At the International Industrial Exhibition to be held in Turin, Italy, from April to October, 1911, there will be sections devoted to electrical, mechanical, and civil engineering, while electrochemistry, telegraphy, telephony, and other branches of electrical science will also be represented. Among the prizes offered is one for new applications of electric power. The interests of British exhibitors are being looked after by the same special committees who were nominated by the Royal Commission for the Brussels Exhibition. A prominent site of about 220,000 sq. ft. in extent has been secured for the British section, and special rates have been arranged for the carriage of exhibits. A memorandum of information relating to the exhibition has been published, and this and any further information required can be obtained from the Director of the Exhibitions Branch, Board of Trade, Queen Anne's Chambers, Broadway, Westminster, S.W.

Electric Power in Sweden.—According to a British Consular report, the Trollhhättan Works, which commenced operation in 1908, has extended its lines to Gothenburg, Alingsas, and Skövde. The Hemsjö Company started up its new power station at Torsebro during the year. In Norrland, the Ungers Industriaktiebolags power station at Arbra was opened, while the Stora Kopparbergs Bergslags station at Bullerforsen is still under construction. The power station of the Uddeholm Company at Forshult and the Västerdalälfvens Kraftaktiebolags power station at Mockfjärd have started operation, and the Hellefors Bruks Aktiebolag has begun the harnessing of four of its waterfalls in Svartälfven. The town of Umea has begun the construction of a power station at Klabböle on the Umea River. A large steam turbine station at Gellivare started work at the close of the year. The most important event in the iron trade during 1909 was the completion of the experiments in iron ore reduction in electric furnaces of different types at the Domnarfvet iron works, in which the furnace of the Aktiebolaget Elektrometall was most successful. The Swedish Iron and Steel Institute has granted a large sum towards experimental works at Trollhättan.

THE FIRE AT THE BRUSSELS EXHIBITION

Lord Lytton, Chairman of the Royal Commission and of the Executive Committee of the British Section of the Brussels Exhibition, has stated that the fire broke out at the corner of the Grande Terrasse nearest the Brussels Kermesse. The main entrance was brilliantly lighted by electric lamps, and it had been suggested that the cause of the fire was a short-circuit at this point outside the Exhibition walls. This view was not, however, upheld by the Belgian authorities, who were of the opinion that the fire broke out inside the Exhibition near this point, and was probably due to the carelessness of some individual. *The Times* states, further, that the theory of a short-circuit has been unanimously discarded, and quotes a statement made by the President of the Exhibition Committee to the effect that the electricity supply had already been cut off for two hours when the outbreak occurred. The Board of Trade has decided to reconstruct a British exhibit, and a grant for this purpose has been made by the Treasury. The Salle des Fêtes has been offered by the Belgian authorities. An appeal to the British exhibitors by the British Commissioner-General has met with a hearty response, and offers of help have been received from various firms, including two shipping companies, who offer to carry goods for the reconstructed British exhibit free of charge from London to Ostend. By Tuesday morning no less than 110 firms had applied for space in the new British Section, and it is expected that a satisfactory exhibit will be arranged in the course of a week or two.

Wireless Telegraphy.—The construction of a wireless telegraph station at Scarborough will shortly be commenced. The decision to erect a station here was the outcome of complaints that no wireless station existed on the East Coast between Caister and Newcastle.

In an article in the *Times* it is stated that the area embraced by the daily weather service of the Meteorological Office has been materially extended by the receipt of wireless telegrams from Atlantic liners. The messages record the state of the weather over the ocean at fixed hours corresponding with those at which observations are made at the land stations. For purposes of weather forecasting, however, the scheme has not as yet been of great value, owing to the unavoidable delay which occurs. As the range of the apparatus on most of the liners does not exceed 300 miles, the messages must be first passed from an outward-bound vessel to a homeward-bound one when the distance is greater, and as a result very few of the reports made by ships when westward of the 20th meridian arrive until at least 12 hours after the observations have been made.

The *Morning Leader* Berlin correspondent states that an interesting experiment with wireless telegraphy will be carried out in connection with the forthcoming German Army manœuvres. A series of towns, including Berlin, Frankfort, and Cologne, will be supposed to be besieged, and efforts are to be made to discover the best means of establishing communication with them. Transportable wireless stations will be made use of to a large extent.

Telegraph Traffic.—The submarine cable between Hongkong and Macao was restored to working order on the 22nd of August. On the following day the Chio-Teredos cable failed, but a quick repair was effected. On the same day the cable between St. Jacques and Doson was interrupted, and, in consequence, telegrams from Tonkin are being sent by land-lines.

National Telephone Co.'s Staff.—In the course of a speech at Saltburn on Monday, Mr. Herbert Samuel, the Postmaster-General, stated that the assertion that only half of the present staff of the National Telephone Co. would be taken over by the Post Office was entirely incorrect. With a few exceptions, the whole staff will, he said, be transferred to the service of the Post Office. The transfer, it will be remembered, will take place on January 1st, 1912, and the Postmaster-General has agreed to take over all the staff who have been not less than two years continuously in the service of the company on December 31st, 1911. This, however, does not apply to officers of the company receiving salaries of £700 a year and upwards. Moreover, employees will be allowed to count for purposes of pension their continuous service with the company subsequent to December 31st, 1909, as service under the Crown.

Underground Telegraph Cables.—It is now some years since the underground telegraph cable between London and Manchester *via* Birmingham was completed, and two or three years ago the line was extended from Manchester to Leeds. Last year an underground cable connecting Newcastle and Stockton was completed, and now Leeds is being connected in the same manner with Stockton. This will complete the chain between London and Newcastle. According to the *Yorkshire Post*, work on an underground line connecting Leeds with Hull will be commenced in a few months.

ELECTRICITY v. GAS FOR STREET LIGHTING

Gas to be Entirely Displaced in Marylebone, Hampstead, and Shoreditch

The Truth about Westminster

IN view of certain inspired paragraphs which have recently been appearing in the daily Press, and which are liable to give the impression that practically the whole of London is lighted by gas, it is interesting to note what is being done in Marylebone, Shoreditch, and Hampstead towards displacing gas entirely for street lighting.

It is anticipated that every street in Marylebone will be lighted by electricity by the end of September. This work has been undertaken in two portions, the first, which is now completed, comprising 1,964 posts, consisting of 1,114 single-burner, 827 double-burner, and 23 triple-burner lamps. The 4¼ cubic feet Kern incandescent gas burners have been replaced by two 35 watt Osram lamps in series; the 8½ cubic feet Kern burners by two 55 watt Osram lamps in series, and in important thoroughfares by two 88 watt lamps in parallel; finally three 88 watt Osram lamps have been put in those lanterns which contained 12¾ cubic feet burners. The first scheme embraced all streets in which distributing mains were

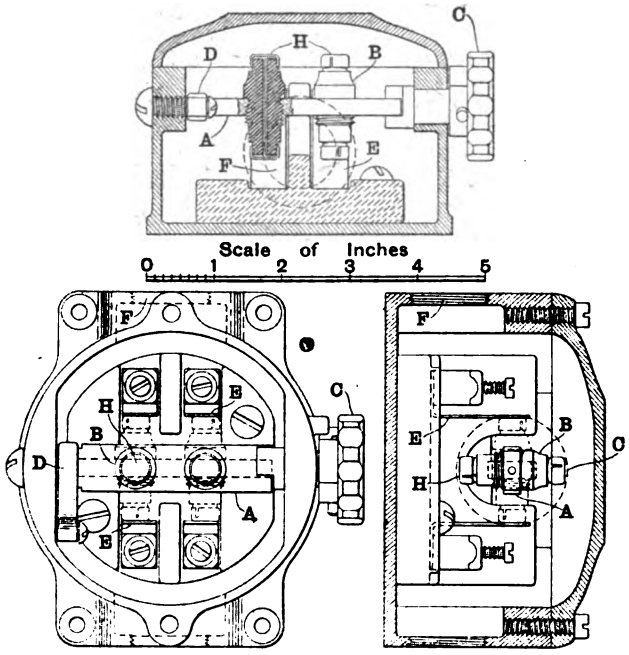

FIG. 1.—COMBINED SWITCH AND FUSE FOR MARYLEBONE STREET LIGHTING.

A.—Turn-bar. B.—Fuse-Carrier. C.—Switch-handle. D.—Spring. E.—Contacts. F.—Inlet and Outlet. H.—Fuse-caps.

laid, the existing gas lamp posts being utilised, and the comparative prices per post per annum are as follows, for all night supply, including maintenance:—

(*a*) 4¼ c. ft. gas lamps, £3 7s. 6d., replaced by electricity for £3 2s. 9d.

(*b*) 8½ c. ft. gas lamps, £5 19s. 5d., replaced by electricity for £4 9s. 6d.

(*c*) 12¾ c. ft. gas lamps, £8 16s. 11d., replaced by electricity for £6 14s. 6d.

In the important thoroughfares where double-burner gas lamps had been used, the effect of the conversion was not quite satisfactory with two 55 watt metal filament lamps, although the candle-power measured by a photometer was the same, and it was decided to replace these lamps by two 88 watt lamps in parallel, and this was done without increasing the cost for supply. On the first scheme the Council's lighting bill was reduced by £1,500 per annum; nevertheless, the Electricity Department, as will be seen later, is making a profit out of the transaction.

The Council was so satisfied, not only from the monetary point of view, but also by the improvement in general lighting, that it was decided last year to displace all the remaining gas lamps in the borough, making 3,500 in all, and to lay new distributing mains where necessary, with the double object of fostering the light and power load in districts hitherto not tapped, and of obtaining an efficient street lighting system. In some cases short services have been laid at the same time as the new distributors, and in others ducts have been laid, a policy which has been justified by the enquiries which are now coming in for lighting and power on the routes of the new street lighting. Indeed, there are anticipations that a good power load will be developed off the side streets.

All the street lamps are run off the ordinary distributors, which are 0·15 sq. in., 0·1 sq. in., and 0·25 sq. in. triple cables, the lamp services being 3/20 twin cable. Each post is fitted with a combined switch and fuse designed and supplied by Mr. Haydn Harrison, who also supplied the fitting in the lantern. The switch fuse box (illustrated in Fig. 1, which is self-explanatory) contains two ebonite fuse carriers, the heads of which form the moving contacts of the switch. Fig. 2 shows the fitting employed. The vibration in the lanterns is taken up by tensile springs arranged so that the whole lamp-holder is in a state of suspension. This will, of course, contribute further in the direction of low maintenance figures, as it will diminish the number of lamp renewals.

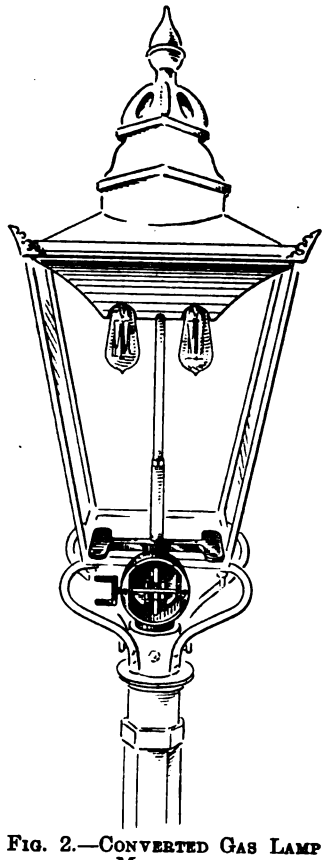

FIG. 2.—CONVERTED GAS LAMP AT MARYLEBONE.

One man is able to turn on or off 130 to 140 switches in the three-quarters of an hour which is the lighting-up time allowed. In this connection it may be mentioned that Mr. C. H. Smyth, the mains superintendent at Marylebone, is at work upon an automatic lighting device operated by an impulse current over the d.c. mains.

Originally the reflectors were made of enamelled zinc, but an Austrian enamelled iron is now used, which, it is found, requires less frequent painting.

The estimates of cost are being well kept to in practice. For the 55-watt lamps in the double and triple lanterns, the price allowed for current was 1·42d. per unit, which is at the ordinary schedule rate. The introduction of the larger wattage lamps reduces this figure slightly. The maintenance figures are made up of 12s. 6d. per annum for lighting, cleaning, extinguishing, and odd repairs; 2s. 6d. per annum for painting, and replacement of lanterns or posts damaged by passing vehicles; and for lamp replacements for 70 and 110-watt posts, 12s. per post per annum, slightly more for 176-watt posts, and approximately 20s. for

Digitized by Google

triple posts. The cost of conversion where distributors are already laid amounts to £3 per post complete. Under the second scheme, which involves trench work and new mains, the cost is estimated to average £12 to £15 per post. This latter scheme has involved the laying of 15 miles of distributors, and 20½ miles of ducts. The total length of streets in the borough is 64 miles. Assuming a *pro rata* saving with the second scheme as with the first, the borough will, when the whole of the streets are lighted by electricity next month, make a saving of £2,600 per annum on its lighting bill compared with the old gas lighting.

In Hampstead, electric street lighting is replacing gas lighting in the whole district of the Borough Council, with the exception of a few of the smaller streets, in which there are no mains. Over 800 street gas lanterns have been converted, and the remaining ones are being proceeded with rapidly. When the work is completed, over 2,000 street lanterns will have been changed over from gas to electric light. In practically all cases a 4¼ c. ft. upright incandescent gas burner is being replaced by two 32-watt 100-volt Osram lamps, and the cost of conversion averages about £6 10s. per post, including all the work and the laying of a switch wire. The Electricity Committee have entered into a contract with the Lighting Committee at the rate of £2 10s. per annum per post for eight years, and £1 10s. per annum per post after this period. By the end of eight years the capital cost of the conversion will have been cleared off; hence the reduction in price. The price includes the supply of current, cleaning, renewals, and everything that is necessary. The comparatively high capital cost of £6 10s. per post is largely due to the switching arrangements, as the lights are switched on and off at the sub-station in groups of about 30 lamps by means of Venner time switches, which are set once a week.

The ordinary distributing mains are used for the supply, but the arrangement adopted has, of course, necessitated the laying of a switch wire. It is estimated, however, that the extra cost of this is quite counterbalanced by the saving in lighting and extinguishing.

Another borough in which electric lighting will shortly displace gas altogether is Shoreditch. Here the Electricity Department have nearly completed replacing 300 gas burners, using the same posts, by 50 and 100 c.p. metal filament lamps, and it is the intention of the Lighting Committee to extend street electric lighting throughout the whole of the Shoreditch area. The main streets are already lighted by arc lamps. The lamps replaced consist of 50 nominal c.p. incandescent gas lamps, either singly or in pairs, the 100 c.p. metal filament lamps replacing two gas lamps in the latter case. The existing lanterns have been adapted in a very simple manner. The hole at the top of the existing reflector has been covered by a plate, and the lamp holder has been suspended from this. Watertight switches are used in each lantern, with the usual knock-over lever arrangement which the lamplighters switch on and off.

Mr. E. Wilmot Seale, Secretary to the Charing Cross, West End & City Electricity Supply Co., has sent a letter to the press with regard to the misleading reports published that the City of Westminster have displaced electricity by gas for street lighting throughout. He first of all points out that the Westminster City Council have only transferred to the Gas Company the lighting of that part of the City of Westminster which has been hitherto lighted efficiently and economically by the St. James's & Pall Mall Electric Light Co. This lighting comprised the supply to 66 arc lamps. The Westminster Electric Lighting Co., under contract, are still supplying, and will continue to supply until 1931, 970 arc lamps, and the Charing Cross Co., under contracts which do not expire for some years, 165 arc lamps in the City of Westminster. With regard to the question of cost, of which so much has been made, Mr. Seale repeats what we stated at the time the matter was discussed by the Westminster City Council (ELECTRICAL ENGINEERING, April 28th and May 5th, 1910), that the conditions of the specification for the new contract were of a nature to handicap the electric supply companies. The electricity supply companies, whose mains are only laid in certain positions whilst the Gas Company's mains cover the entire area, were compelled to quote for the whole of such specific district or districts as might be within their particular area of supply. The City of Westminster Council on their part reserved the right to select any part or parts of those districts for lighting by electricity, to the exclusion of other parts of the district, at the contract price per lamp quoted for the whole district. It is obvious, therefore, that the electricity companies, in the event of the exclusion of parts of the district, might suffer serious loss.

The concessions of the electricity supply companies expire in 21 years, and all capital charges have to be provided for within that period. On the other hand, the Gas Company is not purchasable by the Local Authority, and has, therefore, a practically unlimited period in which it would be possible to deal with capital charges.

The question whether or no the contract will pay the gas company other than as an advertisement is, of course, continues Mr. Seale, one for themselves and their shareholders, but an analysis of their published accounts would appear to show that their costs are 1s. 10d. per 1,000 ft., while the contract price, which includes capital charges for street work, would appear to yield certainly not more than 10½d. per 1,000 ft., as against 2s. 8d. per 1,000 ft. charged to the general public. Would it be very unfair, he says, to deduce that considerations of advertisement and preference had an undue bearing upon the composition of the prices tendered by the Gas Company?

INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION: *Change of Address.*—Mr. C. McArthur Butler, Secretary of this association, informs us that in future communications should be addressed to him at 28 Bedford Square, London, W.C.

THE LATE MR. H. W. COX.—A petition is being prepared by the Hackney Borough Council, and will be submitted to the Prime Minister, urging that an adequate pension be granted to the widow of the late Mr. H. W. Cox, whose death was due to X-ray dermatitis, brought about by his experimental work with X rays.

RUMOURED EXTENSION OF THE LIVERPOOL-SOUTHPORT RAILWAY.—According to the *Liverpool Courier*, the Lancashire & Yorkshire Railway Co. will shortly commence the extension of their electric system to Ormskirk. The company intend, it is said, to inaugurate a circular electric route between Liverpool, Ormskirk, and Southport *via* Beerscough Bridge. An overhead power-line is to be constructed between the power station at Formby and a new sub-station near Ormskirk.

A NEW C.B. TELEPHONE EXCHANGE.—On August 13th the National Telephone Company transferred the subscribers connected to its Trafford Park Exchange to a new central battery equipment installed in new premises at Trafford Park Road, which have been specially designed. The equipment is of the No. 1 C.B. (W.E. Co.'s) type, and consists of eight subscribers' positions giving accommodation for 780 lines, four incoming junction positions, and one exchange testing position. The equipment is of similar design to those previously described in ELECTRICAL ENGINEERING.

Lighting of the O'Connell Bridge, Dublin.—The General Electric Co. have sent us a photograph showing the lighting, by means of Osram lamps, of the O'Connell Bridge, Dublin, which was previously lighted by gas. In all, 39 100-volt, 55-watt lamps are used, these being fitted in the old lanterns put up originally by the gas company. The lamps are in a very exposed position, but, we understand, are giving every satisfaction both as regards life and general illumination.

The Pacific Cable.—The report of the Pacific Cable Board for the year to March 31st, 1910, states that the net receipts amounted to £111,723, which represents an excess of £17,956 over the expenditure. Interest on and repayment of capital, however, amounted to £77,544, which leaves £59,588 to be contributed by the Governments interested. The traffic receipts for the year show an increase of only £403, but a sum of £2,211 should have been credited, but was kept out of the accounts owing to accidental delay in transfers to the Board's account by the Governments of Australia and New Zealand. The expenditure decreased by £2,668. In order to minimise the difficulties with land-lines in Canada, an agreement has been entered into with the Canadian Pacific Railway for the exclusive use of a wire between Montreal and Bamfield. [This line was completed and taken over on Tuesday.] Similar difficulties are being experienced in Australia, and the Government there is being urged to place the control of the land-lines in the hands of the Board.

ELECTRICAL ENGINEERING EDUCATION

III.—COLLEGES, &c., IN LONDON *

As is the case in the provinces, there are colleges and institutions in London of very varying character at which courses in electrical engineering are given. Some of these are incorporated in the scheme of the University of London, such as University College, King's College, and the East London College. The Central Technical College of the City and Guilds of London Institute at South Kensington, which forms the engineering section of the new Imperial College of Science and Technology, ranks also as a school of the University of London. The Finsbury Technical College was also founded by the City and Guilds of London Institute. In addition to these more or less interconnected organisations, and some others of an independent nature, there are a number of institutions or polytechnics in various parts of London, where evening and day classes of various grades are held, and most of these also have well-equipped educational laboratories.

University College.

University College (Gower Street, W.C.) is incorporated with the University of London. The electrical engineering department is under the direction of Prof. J. A. Fleming, F.R.S., who is assisted by Mr. W. C. Clinton and a staff of demonstrators. Mr. H. M. Hobart lectures on dynamo design. Students who go through the complete electrical engineering course of three years can obtain the University of London degree of B.Sc. in engineering, and the college diploma. Degree students are required to pass the matriculation examination of the London University. The composition fee for the three-year course is 120 guineas, which is paid in three instalments—namely, first year, 45 guineas; second year, 40 guineas; third year, 35 guineas. For students who have already completed part of their training elsewhere, special courses are arranged, extending over one or two years, as the case may be. There are also facilities for post-graduate and research work. The accommodation provided for the electrical engineering department, and that of all the engineering departments, was doubled three years ago, and the extensions were opened in 1908. The electrical engineering department has a complete wireless telegraph plant and antenna, which is used to communicate with King's College. Scholarships are awarded to electrical engineering students.

King's College.

King's College (Strand, W.C.) is a college of the University of London. Complete courses of study are arranged in the departments of electrical and mechanical engineering for the engineering degrees of the University of London and for the diploma and certificate of the college. The London matriculation examination should be passed before commencing the course. Either a four-years' course, the winter sessions being passed in the college, and three summer sessions in an engineering works may be taken, or a three-years' continuous college course. The electrical engineering department is equipped with up-to-date appliances for dealing with the heavier branches of the subject, and special attention is given to that of electrical traction. A wireless telegraph installation is in operation between University and King's Colleges. The entrance day for new students is Tuesday, October 4th. Prof. E. Wilson has charge of the electrical engineering department, and Profs. D. S. Capper, H. M. Waynforth, and M. Curry conduct the department of mechanical engineering. An entrance fee of £5 5s. has to be paid, and the tuition fees for the regular course amount to £50 per annum, and £1 5s. per annum laboratory fees.

The City and Guilds of London Institute.

The Central Technical College.

The Central Technical College of the City and Guilds of London Institute in Exhibition Road, South Kensington, is a "school" of the University of London in the Faculty of Engineering, and also forms the engineering section of the Imperial College of Science and Technology. For many years before its affiliation with either of these bodies, it was famed as a centre for electrical engineering education, and the pioneering work in this direction of the late Prof. W. E. Ayrton, F.R.S., will always be a landmark in the history of the subject. The electrical engineering course entirely at the college consists of three years' work, with an optional fourth year, and contains a large proportion of laboratory work. The programme is arranged so that students can take the examinations for the London B.Sc. degree in engineering, but is not absolutely confined to these requirements. The professor of electrical engineering is Prof. T. Mather, F.R.S., who is assisted by a number of demonstrators. Attention should also be drawn to the special post-graduate course in railway engineering, under the superintendence of Prof. W. E. Dalby (head of the mechanical engineering department), which includes lectures on electric traction by Mr. Philip Dawson.

Entering students must be over sixteen, and those not taking the London University matriculation examination must pass a college matriculation examination of about the same standard. A diploma of associate of the City and Guilds of London Institute is awarded to students who have gone through a complete course of instruction as laid down in the programme, and have passed certain college examinations thereon. An honours diploma can be obtained by students who present a thesis embodying the result of original work during a fourth year of study. The title of Fellow of the Institute (F.C.G.I.) is conferred upon associates who have spent at least five years in actual practice and specially distinguished themselves. A number of scholarships are obtainable for engineering students. The fee for the complete course to matriculated students is £36 per session. Special or partial courses can be taken by non-matriculated students at special fees.

The City and Guilds Technical College, Finsbury.

Both day and evening courses are given at the Finsbury Technical College (Leonard Street, City Road, E.C.) of the City and Guilds of London Institute. The day courses cover a period varying from two to three years. The college is provided with laboratories and workshops, and occupies the position of a finishing technical school for those entering industrial life at a comparatively early age, and of a supplementary technical college, for those who, having had some industrial experience, desire to qualify themselves to become foremen or managers. A certificate is awarded by the Institute to students who have passed through one of the complete day courses of instruction with sufficient merit. The age of admission to the day department is over fourteen years. There is an entrance examination once a year in September, and the fee for the session is £20. The principal is Prof. Silvanus P. Thompson, F.R.S., who is himself professor of electrical engineering, and is assisted by several demonstrators. The professor of mechanical engineering is Dr. E. G. Coker. There are several scholarships open to engineering students.

East London College.

The East London College (Mile End Road) is now a school of the University of London, and full day and evening electrical courses, under Prof. J. T. Morris, are arranged for students who take electrical engineering subjects for the B.Sc. examination in engineering, pass, and honours. Students joining the college must be not less than sixteen years of age. The work of the department consists of a three years' course—the first year's work being general electrical engineering; the second year's, two courses, one on instruments and testing, the other on dynamos, motors, transformers, and electric traction; the third year being devoted to a more advanced study of these subjects. In conjunction with the lecture courses, laboratory courses and work in the drawing office have been arranged. The fee for the full-day course is ten guineas per annum. Evening courses of instruction are also given in preparation for the same degree, and facilities are offered in the laboratories for research and experimental investigation. There are also complete courses in the evening for non-university students, and these have been entirely rearranged for the coming session. Special arrangements are made whereby it is possible for shift engineers to attend during the day-time those lectures which they are unable to attend in the evening on account of their night shifts.

* Part I. "The Universities of Cambridge and Oxford," and Part II, "Universities, Colleges, and Technical Schools in the Provinces," appeared in our last issue.

The Electrical Standardising, Testing, and Training Institution.

The course of training at the Electrical Standardising, Testing, and Training Institution (Faraday House, Southampton Row, W.C.) is specialised to prepare for mechanical or electrical engineering appointments, and comprises lectures, instruction in mechanical drawing, as well as laboratory and workshop practice. The full course occupies four years, and two of these (the second and fourth years) are spent in engineering works, the remainder being spent at Faraday House. During the third year, in addition to the lectures by the staff of the institution, a series of lectures by engineers engaged in actual practice are delivered to the students upon special branches of electrical engineering work. Students are also taken to the various engineering works in easy reach of London, under the guidance of Mr. Buchanan, who was formerly works manager and designer to the Electric Construction Company, Ltd. Thus the feature of the training is its practical character and the combination of college and workmanship training upon the "Sandwich" system. There is an employment bureau connected with the college which is very successful in finding students openings. The Principal is Dr. Alexander Russell, Mr. J. Thomas also lectures on mathematics and physics, and Mr. H. M. Hobart and Mr. W. Buchanan lecture on electrical machine design. The visiting lecturers include Mr. W. R. Cooper, Dr. W. H. Eccles, Mr. J. Rennie, M.I.E.E., and Mr R. T. Wallis-Jones. The fees are inclusive of everything, and no extra payments have to be made to the works to which the student is sent. The amounts are as follows: First year, thirty-five pounds a term; second year, seventy-five guineas the year; third year, twenty-five guineas a term; fourth year, fifty guineas the year.

The Northampton Institute.

The principal feature of the electrical engineering course at the Northampton Polytechnic Institute (St. John Street, Clerkenwell, London, E.C.) is the way in which the commercial experience and work at the institute are interlaced. The course occupies four years. In the first year the student works at the institute, and at the end of that period, if he be an undergraduate of London University, he can take the intermediate examination for the degree of B.Sc. in engineering. The second and third year's work consists of six months' training at the institute during the winter, and two periods of approximately six months each passed in commercial workshops during the summer. The fourth year's work is entirely at the institute. The works to which the students are sent include some on the Continent, as well as in this country. The principal, Dr. R. Mullineux Walmsley, is also head of the electrical engineering department, Dr. C. V. Drysdale is the associate head, and is assisted by a number of permanent lecturers and demonstrators. Mr. H. M. Hobart also gives lectures. Special courses are given in electric traction and electro-chemistry. The advanced students, especially in their fourth year, can specialise in these subjects. Since last session the class for electrical engineers' quantities and estimates has been permanent and embodied in one of the special courses. The telegraphy and telephony classes, which hitherto have been separate, are now to be amalgamated, and it may also be mentioned that the aeronautical engineering classes have been further developed, and for the coming session the services of Mr. F. Handley Page have been secured as a lecturer. Before being admitted to the courses, students should be not less than fifteen years of age, and will be required to pass an entrance examination. The fee for the electrical engineering course is £15 per session for the first and fourth years, and £11 for the second and third years. Evening classes are also given.

The South-Western Polytechnic.

Electrical engineering courses are given at the South-Western Polytechnic (Manresa Road, Chelsea) for both day and evening students. The regular three-years' day course includes preparation for the engineering degree of the University of London, and it is also possible for evening students to take the same degree. Special courses are also arranged for the examinations of the Institution of Civil Engineers for Studentship and Associate Membership. Some of the courses form suitable preparation for some of the honours examinations of the City and Guilds of London and the Board of Education. A number of special courses are arranged for students engaged in or preparing for engineering work of various kinds. Students must be over sixteen, and must pass an elementary entrance examination. The fees vary from £7 10s. to £15 per session, according to the number of hours per week. Mr. A. J. Makower is head of the electrical engineering department. Evening courses in electrical engineering extending over four years are also given, and special arrangements may be made for students engaged in central stations, whereby they may attend in the day during those weeks in which they are on night duty. Arrangements have been made with several leading engineering firms whereby students are allowed, without payment of a premium, to enter upon apprenticeship in their works. Students completing their studies in the first-year college courses may proceed at once and continue their work with one of these firms, whilst those who continue their college courses through the second and third years and obtain the diploma of the institute, will, in addition, have their period of apprenticeship substantially reduced.

Battersea Polytechnic.

The Battersea Polytechnic provides in the day technical college a three-years' course in electrical engineering, admission being restricted to students of sixteen years and upwards who pass the entrance examination, or who can satisfy the Principal that their previous education is sufficient. After passing the examination at the end of their third year, students may obtain the Polytechnic diploma. The fees amount to £13 13s. per session of three terms. The ordinary three-years' course covers the work in electrical engineering required for the London B.Sc. degree in engineering. There is also a special course on wireless telegraphy extending over two or three years. Evening classes and labcratory instruction are given in various electrical subjects at low fees (from 5s. to 22s. 6d. per session, according to the number of hours and character of the class), and there is also a complete five-years' evening course. The head of the electrical engineering department is Mr. A. W. Ashton.

The Borough Polytechnic.

The Borough Polytechnic Institute (103 Borough Road, S.E.) is chiefly devoted to evening classes. The courses of instruction in electrotechnology are arranged to cover a period of several years. For students who do not possess any theoretical knowledge of electricity, a first-year course has been drawn up, which deals with general elementary principles. The second-year course is devoted to the more technical applications, including electric wiring. The third-year course deals with more advanced subjects in electrotechnics, including continuous-current machinery, &c. The fourth-year course is a continuation of the third-year work, and takes up the principles of alternating-current working, &c. Students may present themselves for examination by the Board of Education (science and art department) and the City and Guilds of London Institute. The fees are low for all the courses. The head of the electrotechnical department is Mr. J. Henderson.

The Hackney Institute.

Evening courses in electrical engineering are held at the Hackney Institute (Dalston Lane, N.E.), and courses consisting of laboratory work, as well as lectures, can be taken to prepare for the examinations of the London University, Board of Education, City and Guilds of London Institute, and other bodies. The principal, Mr. P. Kirk, is head of the engineering department, and Mr. W. H. F. Murdoch, who has two assistants, is head of the electrical engineering and physics department. The fees are about 10s. per session for each course.

The Crystal Palace School of Practical Engineering.

Electrical engineering subjects can be included in the general engineering course given at the Crystal Palace Co.'s School of Practical Engineering. The electrical work is intended to follow the mechanical and civil courses, which occupy one year. The ordinary curriculum for the electrical section is of two terms duration, including instruction, both theoretical and practical, in the shops and offices of the school; and directed practical work on the electrical installation in the Crystal Palace and grounds. Excursions are made by students to places of engineering interest. The complete fees for the mechanical and civil engineering courses, either of which may be taken alone, or the two one after the other, are £54 and £64 respectively, and the fee for the subsequent electrical course is £21 per term. Each student must also pay 10s. 6d. for an annual season ticket to the Crystal Palace. The principal is Mr. J. W. Wilson.

THE DESIGN OF HIGH-TENSION SWITCHGEAR WITH A VIEW TO SIMPLICITY

By W. S. Burge

As the object of this Paper is to discuss the possibilities of a system of high-tension switchgear having many radical departures from the present-day standard practice of cellular construction, it will first be necessary to point out the way in which a few of the features of existing types of switchgear fall short of ideal requirements. Speaking generally, high-tension switchgear should fulfil, as nearly as possible, the following conditions:—

The control of the circuits should be accomplished with the smallest necessary number of switches, instruments, conductors, and insulators, and the whole switchboard should be reduced to the simplest possible arrangement. The design, while being reduced to the most simple arrangement, should yet be capable of adequately meeting a very wide range of requirements so that the manufacturer may be safe in standardising his gear, and thus attain a certain degree of finality in design that is very valuable to the manufacturer, and ensures extra reliability due to the perfection of one design. In order to ensure against discontinuity of supply, it is very desirable to duplicate all switches and conductors.

In order to meet emergency conditions, it should be possible to isolate any part or section of the switchboard without discontinuity to any other section. The mechanical design at any point of the board should be sufficient to withstand the instantaneous breakdown capacity of the generating plant, and the copper dimensions and insulators must be chosen with a view to withstanding abnormal mechanical strains, as well as the current and voltage effects due to fault conditions. The switchgear should require a minimum of attention and cleaning, and so should be impervious to dust and water moisture.

The author considers that the usual high-tension cellular construction with bare conductors falls short of these conditions in several ways.

From the point of view of simplicity, cellular construction with bare conductors anchored on porcelain insulators necessitates the introduction of a considerable amount of apparatus, the function of which is other than that of controlling the circuits, and should therefore be eliminated as far as possible. The mere presence of a bare H.T. conductor supported on an open insulator necessitates a suitable means for isolating the same, and this can only be accomplished by the introduction of isolating switches, which, in turn, introduce other bare conductors supported on other insulators, so it will be seen that the simple necessity of one switch for controlling each circuit is very greatly exceeded.

This gives rise to a great variety of design, both as regards the general lay-out of the switchgear, the dimensions and construction of the cells, and the actual number and type of switches, and it is in this respect the designer introduces difficulties in the way of obtaining what has been referred to above as finality of design.

It will, however, be seen hereafter that with other systems in which bare copper conductors and open insulators are eradicated, it is possible to arrive at one simple and final design that will meet all possible conditions of working without any departure from the standard construction, and this is a very valuable feature to both the manufacturer and the customer.

The only serious attempt to duplicate any portion of high-tension switchgear has resulted in the practice of duplicating the main bus-bars, and it will be readily understood that the expense of duplicating the main switches and the connections between them and the duplicate bus-bars is generally prohibitive on account of the enormous number of extra insulators, selector switches, conductors, and cell construction, that would be necessary with the cellular system. This question of duplicating the entire switchgear may at first appear to be somewhat unnecessary, but it should be remembered that no engineer would run his station continually without any stand-by plant. Why, then, should not the main switchboard, which has to collect and distribute the total output of the station, be duplicated?—particularly as a fault on the main switchboard almost invariably shuts down the entire plant that feeds on to and from the switchboard.

The necessity for isolation primarily arose from the inherent characteristics of the cellular gear, as it was found imperative to afford means for isolating all bare conductors and open surfaces of insulators for purposes of cleaning and inspection, and although this precaution is quite necessary, it will be seen that the necessity in itself introduces a considerable amount of auxiliary apparatus with their accompanying elements of danger to life and risk of failure while in commission.

On power-station boards in which a large capacity of plant is running behind the switchgear, it is of the utmost importance that all supporting insulators should afford sufficient mechanical anchorage to the conductors to withstand the very heavy strains that occur in the event of a serious fault, and in this respect the brittle nature of porcelain insulators is a continual source of danger.

Although the cost of upkeep on high-tension switchgear is comparatively small, it is very important to reduce the necessity for cleaning and inspection to a minimum on account of the accompanying danger to the man whose duty it is to attend to it. The open surfaces of porcelain insulators require continual cleaning and inspection on account of dust settling and water moisture condensing on the cold surfaces of the insulators, and in the manipulation necessary to isolate the gear for this inspection there must always be a very serious danger of accident.

From the foregoing remarks it will be seen that although the cellular system of switchgear has been largely instrumental in the safe and reliable operation of high-tension plant, there is still sufficient room for improvement to warrant our attention being turned to other systems, and so I now propose to discuss the advantages or otherwise of a system in which there are no bare conductors or porcelain insulators, and the conductors are enclosed in an earth metallic sheath. The principal feature of the system which the author suggests is the use of lead-covered cables, terminating through special sealing ends into the necessary switches and contacts. Lead-covered cable gives an ideal protection against moisture, dust, and dirt, and in the event of any fault causing fusion of the conductor, a lead-covered cable will sufficiently muffle the arc to prevent the volatilised copper spreading the fault, but it will not offer sufficient resistance to the volatilised copper and insulation gases to cause any serious explosive force.

The production of a simple design of panel containing the bare necessity of one switch for each circuit suitable for all conditions that obtain in modern practice, and capable of having any part isolated or duplicated without discontinuity, seems to lie in the production of a selector oil switch of the carriage type, designed that the carriage contacts may plug into sealing end receptacles from which lead-covered cables are taken to duplicate bus-bars and the circuit to be controlled, the oil switch contacts being capable of selecting on to either or both sets of the bus-bars. In a simple design developed on these lines, the writer proposes to bring three single-core lead-covered cables from the circuit to be controlled through plumbed joints into three tubular porcelain insulators cemented one above the other into a concrete slab built into a brick wall. The cables terminate inside the insulators in special female contacts. On either side of these three insulators, and in line with them, are a set of three similar insulators with lead-covered cables leading straight on to two sets of duplicate bus-bars. Thus the concrete slab has nine tubular insulators cemented solid, the insulators being open on the front face of the slab and closed through plumbed joints on the back of the wall. The centre row of insulators lead away to the circuit to be controlled, while the two outside sets lead away to the two sets of bus-bars which are held on suitable brackets fixed on the back of the wall. The bus-bars simply consist of single-core lead-covered cables, each strapped down into a trough, which is supported on the brackets. The board also includes a bus-bar coupling switch which plugs on to a concrete slab containing six tubular insulators into which the two sets of bus-bars terminate.

The carriage-type selector oil-switch consists essentially of two independent sets of moving elements whose function is to close the circuit between the centre stationary element, which corresponds to the circuit being controlled, and either of the two outside stationary elements which correspond to the two sets of bus-bars. The two sets of moving elements operate inside separate oil-tanks, so that we have virtually two independent oil switches mounted on a common casting and operated from one mechanism. The complete switch can be isolated from or coupled up to the cable-end contacts while alive, but a mechanical device is provided by which it is impossible to withdraw the isolating contacts without first tripping the oil switch, and it is also impossible to close the isolating contacts with the oil-switch contacts closed; thus the switch is proof against making or breaking load on the isolating contacts.

Digitized by Google

The necessary current transformers for automatic protection and instruments are housed in hermetically sealed cast-iron boxes, the primary leads being led into and out of the boxes through plumbed joints; and in order to preserve a uniformity throughout the whole board, and render it entirely moisture-proof, the secondary wiring from the transformers is taken through single- or multi-core lead-covered cables plumbed on to small glands in the transformer casing.

The introduction of potential transformers on this type of switchgear offers a design having several important points of advantage over the ordinary transformer tapped off bare connections. The primary leads are taken through lead-covered cables which terminate through plumbed joints inside hollow insulators which are cemented solid into a horizontal casting. The transformer itself is situated inside an oil-tank, and has a set of primary contacts placed so as to engage with the contacts in the hollow insulators when the tank is raised on to the horizontal casting, and the fuses are fixed so as to be immersed under the oil in the tank. The secondary leads are led away through lead-covered cables plumbed on to small glands in the top plate of the transformer.

It will be seen that a carriage-type selector oil-switch offers a duplicate course for each circuit throughout the entire board; thus in the event of a fault occurring on one set of bus-bars, the circuits may be all changed over to the other set of bars by simply operating the handwheels of the switches. Also, should one set of switch contacts become badly burned due to a heavy fault, the circuit may immediately be fed through the other side of the oil-switch on to the other bus-bars.

A lead-covered cable is certainly more expensive than a similar length and size of bare copper conductor, but from the foregoing description it will have been seen that the adoption of lead-covered cables renders possible a design in which an enormous number of auxiliary switches, insulators, lengths of conductor and structural protection can be eliminated, so that the question of extra price is more than compensated for by these eliminations.

NEW FLAME ARC LAMP

THE latest production of the General Electric Co., Ltd. (67 Queen Victoria Street, London, E.C.), is a flame arc lamp to be known as the "Butt" lamp. This lamp is being manufactured at the Witton works of the company. Its chief features are its low price and its simplicity. The lamp has already met with considerable success in Germany, where it is known as the "Conta" lamp. It is of the type in which the tip of one carbon rests on a support below the economiser, there being no clockwork feeding-gear. As shown in Figs. 1 and 2, one carbon *a* (in the D.-C. lamp, the negative) is perpendicular, and the other carbon *b* is inclined, and is swung for striking and regulating by means of a sliding collar *h* on the base-plate *f*. This collar is pivoted at *k*, and is swung by the rod *l* which is attached to the plunger of the series solenoid. The holders of the two carbons are mechanically linked together and feed down as the carbons are consumed. The tip of the perpendicular carbon rests on a swinging support *d* pivoted at *g*. Between the upper arm of the support and the carbon is a pin *e*, which is pressed against the carbon and prevents it from bearing on the lower support with the full weight of the carbons and holders so long as the tip of the carbon rests on the lower arm. When the carbon burns away, the support swings just sufficiently to release the pressure of the pin *e*, and this allows the carbon to feed slightly so that the tip again rests on the support. By supporting the carbon chiefly from the side in this manner, the breakage of the point is avoided. The support is very massive, so as to conduct the heat away quickly from the end, and, further, the arc itself is some five millimetres distant from it, so it does not require frequent renewal. The lamp can be used on either A.-C. or D.-C. circuits without any alteration. The efficiency is given as 0·13 watt per candle-power.

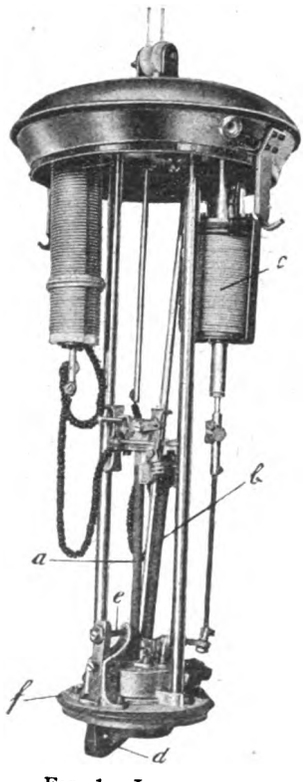

Fig. 1.—Interior of "Butt" Arc Lamp.

An important feature of the lamp is the provision of an automatic arrangement whereby one of the carbons is dropped out of its holder when the carbons have burned down to a certain point. The fire-clay economiser is supported from the base-plate by a metal ring, as shown in the sketch of Fig. 2. On the left of the plate is an electromagnet for providing the necessary weak field to steady and expand the arc. The carbons fit the apertures in the base-plate very closely, and it is practically impossible for any fumes to rise into the body of the lamp. Further, a careful system of ventilation is provided for. An inner globe close to the arc is well swept by the air currents, and is thus kept free from deposit. Air enters at the top of the outer globe, passing down between the two globes, up through a perforated ash-

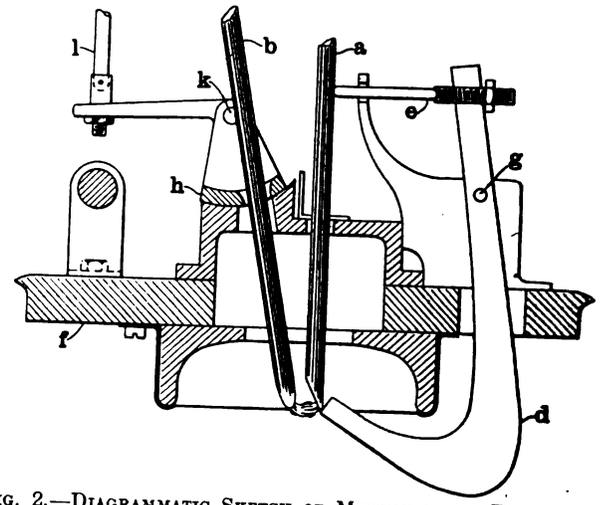

Fig. 2.—Diagrammatic Sketch of Mechanism at Base-plate.

tray in the bottom of the inner globe, and from thence up all round the economiser to the outside of the lamp. Ordinary metal-cored flame carbons are used in these lamps, but with alternating currents only one need be mineralised. The lamps burn singly on 65 volts, or any number may be run in series. The short-hour pattern gives from eight to ten hours on one trim, the long-hour pattern 16 to 18 hours.

For special purposes, a double-carbon pattern can be obtained. The mechanism of this lamp is identically the same as that described above, except that it is in duplicate, and a change-over arrangement is provided so that directly one pair of carbons is burnt out, the other pair is switched in without any interval, so that the change-over is hardly noticeable. From 32 to 38 hours' burning are obtained with this lamp. An important feature is that it is unnecessary to renew both pairs of carbons on each trim, as a partially consumed pair can be left in to be used during the next period of burning. The two arcs can also be run in series, burning simultaneously.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

HAND AND BICYCLE LAMPS.—A new illustrated list has been issued by Messrs. L. E. Wilson & Co. (20 Cross Street, Manchester), giving prices and particulars of the patent "Thomson" accumulator hand-lamp. This lamp is much used by meter readers, inspectors, night watchmen, and others, and we understand that it has found considerable favour in the police force. Several patterns are described, including a bicycle lamp in two sizes, giving 15 and 30 hours of light. These have accumulators in leather cases, and weigh only 1 lb. 8 oz. and 2 lb. 8 oz. respectively.

WATER-TUBE BOILERS.—A booklet from Messrs. Clarke, Chapman & Co., Ltd., Gateshead-on-Tyne, contains a description of the Woodeson water-tube boiler, which the company have supplied in considerable numbers. These boilers have an equal number of upper and lower drums of Siemens-Martin steel connected by groups of straight solid-drawn tubes in a nearly vertical position. The arrangement of the tubes discharging direct into the drums ensures ample steam release area. It is important to notice that no castings are used in the construction, and that only one diameter and length of tube is used.

OIL ENGINES.—A leaflet from the London office of the Maschinenfabrik Augsburg-Nürnberg A.-G. (Caxton House, Westminster, S.W.) gives illustrations of some Nuremberg oil engines for marine purposes from 150 B.H.P. upwards.

CORRESPONDENCE

THE ASSOCIATION OF CONSULTING ENGINEERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I think it must be generally admitted that a consulting engineer should have had at least such an education as would entitle him to the Associate Membership of the Institution of Civil Engineers; but I also think that it would be a great mistake to make such membership a *sine quâ non* of the proposed Association of Consulting Engineers.

The reasons for objecting to a compulsory membership of the Institution of Civil Engineers are so numerous that one cannot put them all in a short letter. Among the most important, however, is the fact that there are many men holding degrees or diplomas of more importance than the A.M.Inst.C.E., who do not see any advantage in belonging to the Civil Engineers, and who are unwilling or unable to increase their annual subscription list.

For instance, in Manchester a consulting engineer may be D.Sc. in Engineering, and a Whitworth Scholar; he may also find it necessary to belong to the Institution of Electrical Engineers, the Institution of Mechanical Engineers, the Manchester Association of Engineers, the Literary and Philosophical Society, and the Society of Chemical Industry. If he has got together a fair practice by honest and straightforward means, his income may still only be very moderate. What possible reason can be alleged for compelling such an individual to join the Institution of Civil Engineers in order to become a member of the new Association of Consulting Engineers? Presumably the new Association will require a subscription, so that at least five guineas a year will be added to the annual list of our supposed individual with little corresponding advantage.

Another objection is to be found in the ill-feeling which I think such a compulsory measure would foster between the members of various societies. It would, in fact, have a tendency to force men against their will to subscribe to one society when they would rather be members of another, and such a state of affairs, besides being unjust to the various societies involved, would also engender undesirable rivalry.

Finally, it is hard to see what object the proposers can have in putting forward this suggestion. It cannot surely be a difficult thing to draw up conditions of membership of the new Association which shall safeguard all the necessary qualifications without giving undue advantage to any society.

The Civil Engineers themselves have been obliged to allow certain well-known examinations to stand in place of their own, and therefore, if an individual is eligible for membership according to their rules, it would be quite as good a test of his qualifications for the new Association as actually forcing him to subscribe to the Civil Engineers first.

Yours faithfully,

20, Mount Street, Manchester. W. CRAMP.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—It is with pleasure that I respond to your request for some contribution to a discussion about the newly-formed Association of Consulting Engineers. The active attention that I give to consulting work is necessarily restricted by the demands of my primary occupation, but I may claim to have some personal interest in the question in addition to a general and mere platonic one.

That such an association has great merits appears to be generally agreed, and discussion may be devoted to the actual details of constitution and procedure. In those, however, will be found some pitfalls and difficulties. For instance, since manufacturers and salesmen will obviously not be admitted, how will the committee regard the fortunate inventor of an important process, system, or machine? Is he not greatly interested in the sale of certain objects? Consider, for instance, the case of the late Dr. John Hopkinson and the three-wire patent, which we may do without offence, because the inventor did actually sell the patent outright, and was not further interested in it. Suppose he had not sold it. Would he, if alive to-day and the patent still in force, be eligible? We can hardly imagine otherwise; but it does not seem strictly logical, for the inventor is clearly subject to just that pecuniary influence or bias which the whole status of the consulting engineer has been devised to avoid. This may serve to show, not, of course, that Dr. Hopkinson ought to have avoided invention, but that the definition of consulting engineer must be drawn with somewhat elastic limitations.

One point in the rules, as at present formulated, seems open to some criticism on the score of undesirable particularism. I refer to the temporary decision that membership of the Institution of Civil Engineers should be a *sine quâ non*. The grounds given for this decision are that this Institution has been the first to require an examination at entrance, and has been the chief mover in all efforts to improve the status of the profession.

While agreeing cordially with the statements, it is permissible to question their cogency. There seems a suggestion that on account of the examination, membership ensures such sound general and technical education as is desirable in a consulting engineer; but it may be roundly stated that most of the present full members joined the Institution before the examination idea was started. Hence, although this restriction will have in this respect some real meaning in the future, it has none at present, and the rule, therefore, appears to be largely of the nature of a delicate compliment to the Institution. However well deserved the compliment, I cannot think that the rules and constitution of a new association are the proper place for its expression.

It is obvious that there are many gentlemen engaged in electrical, mechanical, mining, metallurgical, chemical engineering, and shipbuilding, who deservedly prosecute a good practice in their respective branches without membership of the Institution of Civil Engineers. No doubt they are eligible for membership in the terms of the charter, but why they should be morally compelled to join two new associations is a question they may reasonably ask. If all members of the association must be members of the Civils, why should not the Civils issue a list of its own members who are consulting engineers according to definition? That would serve all the purposes of the new association, except the addition of some letters after each member's name. One good and sound reason for this decision I can understand, to wit, that for very many years the Civils have been a powerful body, so that all their living members have been elected on a basis not greatly differing in essentials from the present standard, whereas in the younger institution there are many who joined when the standard was much lower than it is now. Hence in these bodies the fact of membership has different values. But though this position is intelligible, it can scarcely be considered courageous. For it shirks the onus of deciding whether in respect of eminence in his profession a man is a fit and proper person to enter the association. As this decision is the chief function of the association in its relation to the presumptive member, it does not seem a happy beginning that it should seek shelter under the ægis of another Institution, however unexceptionable, if thereby its constitution will be sensibly distorted. Such a procedure may, indeed, defeat its own ends, for if the association be too closely bound up with the Institution of Civil Engineers, it will be possible for others to argue that they are not concerned with it, and its influence in other branches will materially suffer. For while originally civil engineering was antithetical only to military engineering, and embraced all forms, the meaning usually given to it now is much more restricted, and the Institution, not, perhaps, quite correctly, is regarded as mainly concerned with the restricted meaning. No doubt the Institution would legitimately repudiate this narrowing of its scope, but we must take the meaning of words to be the present and generally accepted significance, not their archaic and chartered definition. The ordinary public attaches a distinct meaning to the term "civil engineer," and the Institution is commonly considered to be an association of such people. Indeed, as time goes on some such process of specialisation must take place.

As it is particularly in the less codified branches of the profession that the influence of the new association will be most beneficial, it would be a great pity to leave any grounds on which possible "free lances" could justify their condition of lawless freedom.

FRANCIS G. BAILY.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Aug. 18th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

17,520/09. **Short-circuiting Device for Induction Motors.** J. H. Holmes & Co. The switch for short-circuiting the rotor-winding when the machine has reached its full speed rotates with the rotor, and is held in its closed position by springs. The switch is held open during starting by means of an external handle, which brings rubbing surfaces into contact and draws the contacts apart. When the switch is in the closed position there are no rubbing surfaces in contact. Seven figures.

25,383/09. **Metal Filament Lamps.** C. G. Redfern (*Compagnie Generale d'Electricité*). This patent covers an apparatus for fusing metal filaments to their supports. A split ring of platinum or carbon is fixed horizontally, and the filament-carrier, with the joints already prepared, is arranged so that the joints are close up to this ring. The whole is enclosed in a glass globe, which is filled with an inert gas. The ring is then raised to incandescence, and the radiant heat fuses the joints. Two figures.

27,976/09. **Storage Battery Plates.** H. de Laminière and Société Anonyme des Accumulateurs de Laminière. A paste for storage battery plates consists of a mixture of oxide of lead, such as minium or litharge, with a solution in distilled water of potassium or sodium tartrate. This paste is said to be very adhesive and suitable for plates of both Planté and Faure formation. It is also claimed to be porous and hard, and to resist entirely the action of sulphuric acid.

349/10. **Metal Filament Lamps.** O. Krause (Deutsche Gasglühlicht A.-G., Berlin). A glass tubular carrier with arms at top and bottom for holding and supporting the filaments surrounds a rigid or elastic stem on which it is elastically supported. The terminals of the filament are connected to the leading-in wires by springs. Various modifications of this construction are described and illustrated. Eight figures.

7,822/10. **Control of Induction Motors.** Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke Ges.*). The rotor current of the polyphase motor to be controlled is fed into the A.C. side of a rotary converter, and the continuous current generated is supplied to a D.C. motor coupled to the rotor of the main motor. The starting resistances of the main motor are placed in series between the rotor and the rotary converter, so that the armature of the latter forms the neutral point for starting up. As the rotary converter is excited before the main motor is started up, the rotor currents run it up in step with the main motor, so that synchronising apparatus is not required. One figure.

8,219/10. **Train-Lighting Dynamo.** H. Leitner (Woking). Instead of exciting the machine partly from subsidiary brushes, the main brushes are made to cover a wide arc of the commutator, and the pole pieces are arranged to cover a larger proportion of the pole pitch. The current due to the short-circuiting of turns by the broad brushes gives rise to a cross-magnetising field in the pole tips, which, in conjunction with the main and armature fields produces a resultant furnishing a constant E.M.F. at the main brushes, independent of variations in speed. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.
Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Siemens Bros. & Co., and Bradley [Twin projectors] 17,904/09; Lewis [Electrodes] 18,469/09 and 15,977/10; Campe and Regener [Globes] 1,198/10.

Dynamos, Motors, and Transformers: Allgemeine Elektricitäts Ges. [A.-C. commutator machines] 10,665/09; Taylor and Scotson [Automatic regulation of machines] 17,739/09; Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke Ges.*) [Single-phase commutator machines] 29,090/09, and [Regulating gear for winding engines and rolling mills] 29,446/09.

Electric Ignition: Robert Bosch, 13,589/10, 13,899/10, and 14,575/10.

Electrometallurgy and Electrochemistry: Evans-Jackson (*Hiorth*) [Induction furnaces] 24,302/09; Petersson [Charging of resistance furnaces] 27,674/09; Newlands and Parkinson [Electrolyte for primary cells] 9,176/10.

Switchgear, Fuses, and Fittings: Jukes-Brown [Switches] 17,895/09; Kenny [Lift control] 17,998/09, and [Combined wiring conduit and picture rail] 17,999/09; Matear, Kenny, and Woodhouse [Lift control and indicating mechanism] 19,203/09; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Circuit-breakers] 10,771/10.

Telephony and Telegraphy: Brown, Judd, and Hardie [Telegraphy] 17,774/09; Marconi's Wireless Telegraph Co. and Marconi [Wireless telegraphy receiving apparatus] 18,922/09; Siemens Bros. & Co. (*Siemens & Halske A.-G.*) [Automatic telephone exchange] 27,458/09; Kitsee [Telegraphic relays] 2,349/10.

Traction: Blackall and Newman [Signalling] 17,675/09; Jellinek and De Tóváros [Suspension of trolley wires] 8,831/10.

Miscellaneous: Webber [Electric clock-winding mechanism] 17,888/09; Birkbeck (*European Regenerator Co.*) [Exhaust steam accumulators] 18,115/09; Clements [Advertising signs] 18,310/09; Anschutz & Co. [Gyroscopes] 22,602/09; Soc. D'Electricité "Nilmelior" and Colas [Indicating and registering devices] 827/10; A.-G. Brown, Boveri et Cie. [Marine turbines] 1,432/10; Hartman [Electrical purification of liquids] 1,461-2/10; Phillips-Woodey [Fire and burglar alarm] 5,510/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: Malachowski, 5,660/10; August Schwarz Bogenlampenfabrik [Double carbon lamp] 16,841/10.

Electrometallurgy: Helfenstein [Electric furnace] 17,650/10.

Instruments: Siemens & Halske A.-G. [Recording frequency meters] 16,342/10.

Traction: Mahoney [Electric braking systems] 15,836/10.

Opposition to Grant of Patents

17,349/08. **Wireless Telegraphy.** E. von Lepel. This patent has been granted in spite of opposition. It covers the discharger used in the Lepel system of wireless telegraphy, in which the metal discs are separated by a thin piece of paper. (See Electrical Engineering, Vol. V., 1909, pp. 434 and 1086.)

6,424/09. **Wireless Telegraphy.** W. P. Thompson (*Ges. für Drahtlose Telegraphie*). The grant of this patent has been allowed. It covers apparatus for producing slightly damped oscillations by the Wien "shock excitation" method, and consisting of parallel metal plates with a ring of insulating material between them to enclose the sparking area.

16,328/09. **Tungsten Filaments.** C. H. Weber. This patent has been granted in spite of opposition. It covers a process for treating tungsten powder to render it less liable to oxidise. (See Electrical Engineering, Jan. 6th, 1910, p. 16.)

27,590/09. **Gyroscopic Mono-rail Apparatus.** R. Scherl. Opposition has been entered to the grant of this patent, which covers apparatus to cause forces to act on the gyroscope proportional to the precessional speed.

Amendment of Specification

8,438/08. **Prepayment Meter.** C. E. Hibberd. This specification has been amended in order to remove certain ambiguities.

Restoration of Patent

17,879/04. **Terminals.** J. Schade. This patent, covering a spring-clip terminal, has been restored to the Fahnestock Electric Co. (See Electrical Engineering, February 17th, 1910, p. 128).

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

19,246-7-8 of September 1st, 1896. **Steam Turbines.** C. K. Mills (*C. G. Curtis, U.S.A.*). The first two of these three important patents cover the principle and construction of the Curtis parallel-flow steam turbine, in which the steam is passed first through an expansion nozzle, and then through a series of velocity stages. The third patent covers a method of governing by varying the volume of steam without altering its initial velocity.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Starting device for mercury-vapour lamp] 9,431/05.

Distribution Systems, &c.: A. Whalley and E. A. Bayles [Fireproof cables] 10,430/04.

Dynamos, &c.: B. G. Lamme [A.C. commutator motor] 7,295/05.

Electrometallurgy, &c.: M. Otto [Apparatus for treating gases with electric discharge] 11,010/97.

Instruments, &c.: W. D. Watson and T. Humphreys [Prepayment meter] 11,045/97.

Switchgear, &c.: J. B. Meiklejohn [Ceiling rose] 10,177/98; G. Mower (*H. H. Cutler, U.S.A.*) [Time-element overload relay] 10,437/98; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Oil switches] 10,460/04, and [Motor starter] 10,461/04.

Miscellaneous: J. C. Dobbie [Ships' log indicator] 10,314/04.

Digitized by Google

LOCAL NOTES

Accrington: *Bonus System Condemned.*—The Local Trades Council are supporting a movement for the abolition of the bonus system on the tramway system. It is argued that the system is calculated to cause drivers to run the risk of accidents.

Acton: *Electricity Undertaking.*—An account is given in the annual report of the Borough Accountant of the working of the electricity undertaking during the past year. Expenditure decreased from £13,285 to £12,065, whilst the income increased from £8,341 to £11,390, or a net increase of £3,048. The deficiency on the year was £675, compared with £4,944 for 1908–9. The reduced charges made by the Metropolitan Electric Supply Co., which came into operation on July 1st, 1909, resulted in the Council obtaining 242,468 more units than in the previous year, for a decreased payment of £763. The average price paid for each unit purchased from the Company was 0·86d., as against 1·26d. in 1908–9. On the income side of the account sales increased by 188,004 units, of which increase 79,273 units were accounted for by the reinstatement of the electric street lighting on the main roads, and 95,824 units by the demand made by the sewage pumps. The gross profits on the year's working was equal to 1·32d. per unit sold.

Bulk Supply.—At the last meeting of the Council it was suggested that in view of the possibility of the negotiations of the Metropolitan Electric Supply Co. falling through, it was advisable for the electrical engineer to obtain definite information as to the approximate cost of erecting a generating station. It was decided to discuss the matter fully at the next meeting of the Council.

Barnsley: *Electricity Accounts.*—The accounts of the electricity undertaking for the year to March 31st show a net profit of £1,800 after meeting capital charges. The number of units sold were 1,491,945, and the total maximum supply demanded 822 kilowatts.

Blackburn: *Short Circuit on Tramcar.*—As the workmen's early car was leaving Salford Bridge for Wilpshire on Saturday, it was discovered that the whole ironwork of the tram was "alive," due to a fault in the trolley standard. Two Corporation employees received somewhat severe injuries, one being burned on the left hand and one side of the face.

Bournemouth: *Electricity v. Gas.*—Speaking at the annual meeting of the local Gas & Water Co. last week, Mr. G. C. Whiteley, the Chairman, said they had nothing to fear from electricity. Whilst the latter was not standing still, neither did the Gas Company intend to stand still, and the shareholders could look forward with perfect confidence to the ability of their engineers to meet any serious competition which might arise by the lessening of the price of electricity by also lessening the price of gas.

Brumby and Frodingham: *Street Lighting.*—A scheme for the lighting of the streets by electricity has been referred to a special meeting.

Canada: *Edmonton: Electric Supply.*—An offer of the Edmonton Heat and Power Co. to supply 10,000 horse-power at £4 per h.p. per annum for 30 years is now being considered by the City Commissioners. At present, says the *Standard* correspondent, the city is using 4,000 h.p. per annum, at a cost of £12 per horse-power.

Croydon: *Through Tram Fares.*—Mr. T. B. Goodyer, General Manager of the Croydon Tramways, reports that during the first year of through booking with the London County Council trams, which has just expired, 1,078,052 passengers availed themselves of the new facilities. Of these 508,504 booked from the London to the Croydon line, and the remainder from the Croydon to the London line.

Dundee: *Bonuses to Tramwaymen.*—A bonus system is to be instituted on the Corporation tramways, the points which will be considered being financial result, personal appearance and conduct. The grants, which will be divisible in equal proportions between the driver and conductor, will be £6, £4 and £2.

East Ham: *School Lighting.*—The Medical Officer of Health to the Education Committee, in his annual report, says that the gas lighting in many of the schools is unsatisfactory, and recommends that electric light should be installed in schools in future.

Glasgow: *Tramway Employees' Grievances.*—According to the local papers, the Corporation tramway employees are discontented regarding their hours of labour, holidays, and other matters. Meetings are to be held under the auspices of the Municipal Employees Association.

Haslingden: *Supply in Bulk.*—The Council, after having considered the terms offered by the Rawtenstall and Accrington Corporation and the Lancashire Electric Power Company, have decided to accept the offer of the Accrington Corporation for the supply of electricity in bulk.

Hastings: *Dolter System and Eyesight.*—In the Hastings County Court last week a motorman recently employed by the Hastings Tramways Co. endeavoured to establish a claim for workmen's compensation on the ground that his eyesight had been injuriously affected by the continual flashing from the studs of passing cars on the Dolter surface-contact system, which is in use on the sea-front there. It was alleged that as a consequence of the flashes so caused, the man's eyesight had been weakened to such an extent that he was declared medically unfit to drive a car. At the close of the plaintiff's case the Tramway Company's legal representative submitted that on the evidence there was no case to defend, and an adjournment was taken to consider this point. The case will not come on again before October, and should the Judge decide that a case has been made out on behalf of the motorman, then the action will proceed and evidence for the Company be taken.

Ipswich: *Electric Supply Accounts.*—The past year's working shows a net profit, after meeting capital charges, of £1,080, of which £735 have been placed to reserve. The balance has been allocated in respect of preliminary expenses and rebuilding boiler settings. The number of units sold increased by 10·2 per cent. During the year the Admiralty wireless station in Portman Walk was connected up. The free wiring (rental) system has now been in operation for upwards of two years, and during the past year has been the means of obtaining 51 out of the 128 new consumers connected. The Installation Department has been kept well employed throughout the year. The value of work done (which does not include the value of free wiring work) has been £3,043, showing a profit of £166.

Tramway Accounts.—The revenue for the past year shows an increase of £714, but it was necessary to call upon the rates to the extent of £2,796 in order to meet the deficit on the year of £1,732 and the deficit of £1,056 brought forward from the previous year. A small surplus is thus carried over.

Leeds: *Tramway Rail Corrugation.*—The Corporation Tramway officials have been carrying out tests with regard to the cost and expenditure of corrugation on the City tramway rails. The tests in question are part of the general enquiry which has been inaugurated by the Municipal Tramways Association.

Leith: *Halfpenny Tramway Fares.*—As a result of an agitation by the ratepayers, halfpenny fares have been reintroduced by the Corporation. They were abandoned some time ago owing to their being unremunerative.

Llandudno: *Promenade Lighting.*—Complaints are being made as to the inadequate electric lighting of the promenade.

Lowestoft: *New Condenser.*—The Council recently agreed to purchase a condenser for the electricity works, and intended shortly to invite tenders. The engineer now reports that a condenser suitable for the purpose is offered for sale by the Westminster Electric Supply Corporation, and it has been decided to inspect and purchase this if found suitable.

Municipal Wiring Powers.—The question of supporting the proposed Bill to confer wiring powers upon all municipalities has been referred to the Electrical Engineer and the Town Clerk.

Maidstone: *Municipal Wiring.*—The Electricity Committee recommend that the Council support the proposed Bill of the I.M.E.A. for conferring wiring powers, &c., upon municipalities, and also that financial support to the extent of £25 be given.

Manchester: *Ratepayers and Loan.*—The Manchester Ratepayers' Association have been in communication with the Local Government Board concerning a loan of £40,000 for electrical extensions, which has been granted without a local enquiry. The Association protest against this procedure

OSRAM LAMPS

Digitized by Google

and requests to be informed as to the authority upon which such a course of action was taken. It is suggested that the Local Government Board are compelled to hold an enquiry into every application for a loan. The latter request was sent on July 29th, but owing to the Parliamentary vacation or other circumstances, no reply has yet been received.

NEWCASTLE: *Trackless Trolley System.*—A survey is being made of the proposed route for the trackless trolley cars between Heaton, Gosforth, and Benton. A report is to be prepared and presented to the Council.

OLDHAM: *New Car Depôt.*—The new car depôt which the Corporation have erected at Hollinwood, at a cost of £22,760, was formally opened on Thursday. Accommodation is provided for sixty cars.

PORTSMOUTH: *Tramway Profits.*—The Council have decided to allocate £5,000 from the tramway profits to the relief of rates.

RIO DE JANEIRO: *Street Lighting.*—A cable message from South America states that the Rio de Janeiro Tramway, Light, & Power Co. have erected 2,000 arc lamps for street lighting under the terms of the new contract with the municipality.

SKIPTON: *Electric Lighting.*—The Town Hall is being wired for electric lighting in connection with arrangements for giving cinematograph exhibitions.

SOUTH WALES: *Electric Supply in Ammanford.*—The Ammanford Electric Light Co. have added a new gas-driven generator set to their plant to meet the increasing demand for electrical energy.

WALSALL: *Through Tramway Running.*—An agreement has been come to with the Wolverhampton District Electric Tramways, Ltd., whereby the Corporation shall pay an increased allowance for working expenses in respect of the mileage run by the Corporation cars on the Company's lines in Willenhall.

WEYMOUTH: *Tramways.*—The Electric Lighting Committee have presented a report upon some means of locomotion in the town, in which the merits of motor 'buses, electric and petrol-electric 'buses, trolley 'buses, and electric tramways are considered. The Committee dismiss both the omnibus propositions, and regard the trolley omnibus as of too experimental a character. The tramway scheme which is recommended will involve a capital expenditure of £27,000, and annual charges amounting to £5,680. It is recommended that the Council should apply for a Tramways Provisional Order in the next session of Parliament.

WHITLEY: *Tramway Communication.*—The Council are in communication with the Tynemouth Electric Traction Co. with regard to the extension of the tramways to Whitley and Blyth.

WIMBLEDON: *Municipal Wiring.*—The Council have decided to support the proposed Bill of the I.M.E.A. conferring wiring powers upon all municipalities, and to contribute £25 towards the cost.

YORK: *Completion of Tramway System.*—With the completion of the structural alterations to the Lendal Bridge, the York tramway system is now practically completed.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

ALDERSHOT.—The sanction of the Local Government Board has been received for borrowing £1,500 for mains and services.

BURY ST. EDMUNDS.—An enquiry is to be held concerning a loan of £1,463 for electrical extensions.

CARLISLE.—Tenders are invited by September 5th for a coal storage and conveying plant at the electricity works. Particulars from the City Electrical Engineer.

DARLINGTON.—The condensing plant is to be extended at the electricity works at an estimated cost of £1,500.

HEYWOOD.—A loan of £4,000 is to be taken up for cables.

HOYLAKE AND WEST KIRBY.—Mains extensions are to be carried out and the economiser is to be overhauled.

IPSWICH.—Tenders are to be invited for a year's supply of cables.

LITTLEBOROUGH.—Tenders are invited by September 13th for a supply of single and three-phase electricity meters. Particulars from the Town Clerk. Forms of tenders may be seen at the offices of Messrs. Hawtayne & Zeden, 9 Queen Street Place, London, S.W.

RAWTENSTALL.—Tenders will shortly be invited for additional switchboard panels and a negative booster in connection with the Whitewell Valley Tramways scheme. An extension of the high-tension switchboard is also required.

SPAIN.—The Belgian Consul at Granada points out in a recent report that electrical energy is extensively used in the province of Granada, mainly for lighting purposes. There are three large power stations there, and about a dozen smaller stations in the province. Plans are being drawn up for the utilisation of other large waterfalls in the Sierra Nevada, with the object of supplying electrical energy to the neighbouring provinces.

STALYBRIDGE.—The Stalybridge Joint Tramways and Electricity Board propose to borrow £22,268.

TRANSVAAL.—According to the *Elektrotechnischer Anzeiger*, a large power station is to be erected at Tweefontain, Transvaal, for the purpose of supplying electric power to a steel works and electrochemical works for the manufacture of calcium carbide, nitric acid, artificial nitrate fertilisers, and other electrochemical products.

WEST HAM.—The Local Government Board have now sanctioned loans amounting to £118,525, which includes the loan of £67,025, to which sanction was refused some time ago. The remainder was applied for last month.

MISCELLANEOUS

AUSTRALIA.—Tenders are invited by the Deputy Postmaster-General, Melbourne, by October 4th, for the supply of telephone material (Schedule No. 363). A deposit will be required with each tender. Local representation is necessary. Copies of the specification and form of tender may be obtained on application from the High Commissioner for the Commonwealth of Australia, 72 Victoria Street, London, S.W.

Tenders are invited by the Deputy Postmaster-General, Melbourne, by October 4th, for 5,000 insulators, porcelain, with two groves, triple shed, as per schedule No. 22.

GORING-BY-SEA.—A scheme of public electric lighting is under consideration by the Council.

GRANGEMOUTH.—Tenders are to be invited for street electric lighting fittings.

HUNGARY.—It is stated that the municipal authorities of Kecskemet (Hungary) have arranged to contract a loan of £62,500 for the construction of an electric tramway.

LEEDS.—The Leeds Tramway Committee have settled the terms of an agreement with the Morley Corporation for the extension of their tramways through Morley.

MANCHESTER.—The Tramways Committee invite tenders for steel girder tramway rails. Particulars from the General Manager, and tenders by September 6th.

POWELL DUFFRYN STEAM COAL CO.—Tenders are invited by September 12th for general stores, including electrical goods. Particulars from Stores Manager, Aberaman Offices, near Aberdare, and tenders to 101 Leadenhall Street, London.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

PROVINCES.

ABERDEEN.—Extensions to St. John's Church (£30,000). Chairman of Committee.

ABERTILLERY.—Aberbeeg Council School. Education Committee.

ALTRINCHAM.—Additions to Conservative Club. Architect, Mr. T. Blagburn, 21 Station Buildings.

ARUNDEL.—Development of West Arundel Estate for garden city. Builders, Greenwood & Son, Halifax.

BARNSLEY.—Carnegie library at Penistone. Town Council.

BARRY.—Large iron and steel works. Mr. Dundrett, Secretary, c/o Barry Steel & Iron Co.

BATH.—The widow of Alderman Proctor Baker has made a gift of £10,000 for the erection of a sanatorium for consumptives at Winsley, near Bath.

BELFAST.—Block at the Royal Victoria Hospital. Governors.

BIRMINGHAM.—Secondary schools, Charles Arthur Street, St. Benedict's Road, Cherrywood Road. Education Committee.

Electric theatre, Longmore Street.

New baths, Brearley Street and Bacchus Street.

BOURNEMOUTH.—Extension to workhouse infirmary (£16,000). Clerk, Board of Guardians, Bournemouth.

BLACKBURN.—New Baptist Church, Montague Street. Architect, Mr. F. J. Parkinson, 9 Richmond Terrace.

Digitized by Google

Boston.—Alterations and additions to barracks. Architects, Scorer & Gamble, Bank Street Chambers, Lincoln.

Clydebank.—Alterations and additions, 32-4 Alexander Street, for the Clydebank Co-operative Society.

Crompton.—New street. Mr. Arthur Clegg.

Dumbarton.—Theatre, Church Street. A. C. Denny, Architect, 37 Church Street, Dumbarton.

Dunfermline.—Additions to Town Hill School. Architects, Ure and Beveridge, 43 Carnegie Street.

Edinburgh.—Alterations at Chalmers Hospital. Architect, A. H. Paul, 16 Rutland Square.

Additions to Grove Biscuit Factory, Slateford Road. Architect, R. R. Hogg, 96 Mayfield Street.

Salvation Army building, corner of West Port and Vennel. Apply Headquarters, London.

Glasgow.—Extensions at Royal Asylum Laundry. Architects, J. Burnet & Sons, 239 St. Vincent Street.

Reconstruction of Court Houses, Jail Square. Architects, Clark & Bell, 212 St. Vincent Street.

Warehouse and offices, corner of Killearn Street and Saracen Street. Architects, Wylie & Blake, 219 St. Vincent Street.

Gravesend.—Boiler-house, &c., for the Imperial Paper Mills, Ltd.

Hamilton.—School at Auchincampbell (£40,000). Architects, Messrs. Cullen, Lochhead & Brown.

Hitchin.—The Town Hall is to be wired for electric lighting.

Hornsey.—Rebuilding on site of Tabernacle.

Hyde.—Infectious Diseases Hospital. Town Clerk.

Isle of Man.—School, Douglas. Architects, Messrs. Harrison & Co., London.

Kingston-on-Thames.—Drill hall for the 6th Battalion East Surrey Territorials.

Lincoln.—Carnegie library (£10,000). Public Library Committee.

Maidstone.—Offices and workshops, Rogers Wharf (£2,000). W. T. Burrows, Builder, Maidstone.

Manchester.—Enlargement of Council Chamber (£6,000). R. F. Vallance, City Surveyor.

Middlesbrough.—Enlargement of workhouse. Clerk, Board of Guardians.

Middlesex.—Alterations and extensions to the Guildhall, Westminster (£71,907). Architects, J. S. Gibson and the County Engineer.

Middleton.—Conservative club, Monmouth Street. Secretary.

South Wales.—Tenders are invited for carrying out certain alterations and additions to the Treherbert branch of the Ton Co-operative Society, Ltd. Architect, W. D. Morgan, 194 Ystrad Road, Pentre, Rhondda.

A row of 50 houses is to be erected at Duffryn Rhondda for the Duffryn Rhondda Building Club. Architect, F. B. Smith, Port Talbot.

Business and dwelling premises near Merthyr. Architects, Johnson & Richards, Merthyr Tydvil.

Stirling.—Municipal buildings. Surveyor, Stirling Town Council.

Todmorden.—Town Hall. Town Clerk.

Weymouth.—Elementary school (£3,068). Crickmay & Sons, Architects, 49 St. Mary Street, Weymouth.

Winchester.—Elementary school. A. H. Johnson, Architect, Hilcote, Headbourne Worthy.

TENDERS RECEIVED AND ACCEPTED

Barnet.—The Guardians have accepted tenders for the three sections of their electric lighting scheme as follows:—Section A, £185; Section B, £99; Section C, £368. At the last meeting it was stated that the North Metropolitan Electric Power Supply Co. quoted a price about three times as high as that at which the Guardians will be able to generate with their own plant.

Belfast.—Tenders of the British Insulated & Helsby Cables, Ltd., for cable, aggregating £305, have been accepted.

London.—The Steeplejack and Engineering Co., of Nottingham, have received instructions to put in hand extensive repairs to the two chimney shafts at the Bankside power station of the City of London Electric Lighting Co., Ltd.

Maidstone.—The tender of Messrs. Arthur Lowcock, Ltd., for a condenser at £343 10s. has been accepted.

Rawtenstall.—The Corporation have accepted the tender of Messrs. Wm. Underwood & Brother, of Dukinfield, for the construction of the permanent way of the new tramway in the Whitewell Valley.

The tender of Messrs. W. T. Glover & Co., Ltd., of Manchester, has been accepted for cables and ducts for the Whitewell Valley Tramways, and that of Messrs. Clough Smith & Co., Ltd., for overhead equipment.

Rochdale.—Contracts have been placed for 5,000 tons of coal for the electricity works. This is about 1,000 tons more than last year. The average price is about the same as last year.

Skipton.—The tender of the National Gas Engine Co. has been accepted for a gas engine in connection with the electric lighting of the Town Hall, and that of Mr. J. Banks, of Skipton, for a dynamo.

Walsall.—The tender of Messrs. J. & F. Wootton, of Bloxwich, for making various alterations and additions to the tramway depôt, Bloxwich Road, has been accepted at £1,916 13s.

West Ham.—The tender of Mr. J. T. Halsey, of Stratford, has been accepted at £288 for the wiring of the West Silvertown Schools.

APPOINTMENTS AND PERSONAL NOTES

We congratulate Mr. Maurice Solomon, of the General Electric Co.'s Witton carbon works, on the occasion of his marriage, on the 16th inst., to Miss Christine Davis, eldest daughter of Arthur Davis, M.A., of Roundhay, Leeds.

The late Hon. Maurice Raymond Gifford, C.M.G., a director of the British Columbia Electric Railway Co., left estate valued at £36,966, with net personality at £26,902.

The salary of Mr. R. H. Wilkinson, manager of the Huddersfield tramways, has been increased from £375 to £400 per annum.

Councillor J. Speakman, of New Cross, has been elected President of the Association of Tramway and Vehicle Workers for the coming year.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 10s. (last week £58 5s. to £58 10s.).

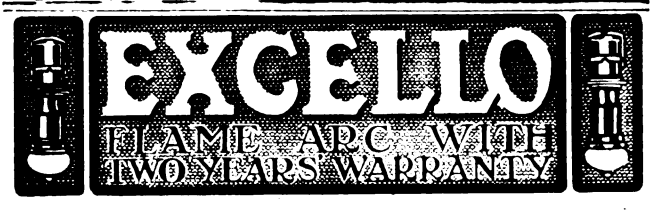
BANKRUPTCIES, LIQUIDATIONS, WINDINGS-UP, &c.—F. Peacock, electrician, 59 North Station Road, Colchester, has been adjudicated bankrupt.

The last day for receiving proofs in the bankruptcy of T. L. Callender, electrical engineer, trading as the Shamrock Cycle Co., Grove Place, St. Heliers, Isle of Jersey, is September 3rd. The trustee is Mr. E. W. Humphreys, 4 Castle Place, Nottingham.

The Telewriter Syndicate, Ltd., is to be wound up voluntarily, the assets having been sold to the National Telewriter Co., Ltd. Mr. John Craggs, the Chairman, is liquidator.

PORCELAIN INSULATORS.—H.M. Trade Commissioner for New Zealand (Mr. G. H. F. Rolleston) reports that a firm at Wellington wish to get into communication with British manufacturers of porcelain insulators. Communications in this connection, together with catalogues and price-lists with discounts, should be addressed to H.M. Trade Commissioner, 9 Grey Street, Wellington, New Zealand.

HOLIDAYS.—Messrs. Ferranti's works and offices at Hollinwood will be closed from Friday evening, August 26th, until Monday morning, September 5th. A small staff will be retained to deal with urgent correspondence.



MISCELLANEOUS CITY NOTES

GENERAL BERLIN TRAMWAYS CO.—Herr Rathenau, general manager of the Allgemeine Elektricitäts Gesellschaft, has been appointed a director. There have been disputes between the municipality and the tramways company, and it is hoped that this step will help to put an end to this, as Herr Rathenau is also chairman of the Berliner Elektricitäts-Wirke, which supplies the power to the tramways company.

DIVIDENDS ANNOUNCED.—South America Light & Power Co., 5 per cent. for the year to March 31st, placing £1,500 to reserve and carrying forward £558.

MORTGAGES AND CHARGES.—Cleveland & Durham Electric Power Co.: Particulars have been filed of an issue of August 6th of £8,500 debentures, part of an issue of £150,000.

LLANELLY ELECTRIC LIGHT & TRACTION CO.—A prospectus has been issued offering 60,000 cumulative 6 per cent. £1 preference shares at par. The company have entered into a contract with the District Council to provide the whole of the public lighting for ten years, the installation comprising 40 arc lamps and 500 incandescent lamps. In addition, 7½ miles of light electric railway will be constructed, for which the contractors, Messrs. Balfour, Beatty & Co. will accept £48,000 in cash or in 5 per cent. debentures at 95, and the balance of £20,250 in cash or fully paid ordinary shares, at the option of the company. A general private supply of electricity will also be given by the company.

SUMMARY

OUR Monthly Supplement on Electrical Engineering in Mines is included in this issue, and contains an illustrated article on the three-phase electric winder installed at the Abercwmboi Colliery of the Powell Duffryn Steam Coal Co., which is a fine example of the simplest form of electric winder without load-equalising flywheel plant. We understand that the evidence given before the Committee appointed by the Home Secretary to consider the special rules relating to electricity in mines will be printed and published. The report of the chairman will be presented before the end of the year. Some notes on electrical mining patents published during August are included in the supplement.

MR. HORACE BOOT writes with reference to the new Association of Consulting Engineers, emphasising the need for such a body, but criticising the qualifications required. (Page 560.)

IN consequence of an accumulation of mussel spawn and other marine growth in the condenser pipes at the Southwick electricity works of the Brighton Corporation, a new system of circulating pipes will have to be installed, as it is impossible to clean them out. The new turbine now being erected is to be connected to an entirely new system of piping. (Page 566.)

A NEW Post Office Metropolitan telephone exchange, equipped on the Peel-Conner system, will be opened on Saturday. We publish a description, together with photographs, diagrams, and illustrations of new apparatus. The system is a further development of that employed at Glasgow and described in our columns a fortnight ago, and the difficulty of using it in connection with small private branch exchanges has been overcome. (Page 561.)

A BRITISH Consular report suggests the formation of a limited company by British engineering manufacturers, with headquarters in Russia, for extending British engineering trade with that country. (Page 563.)

AMONG the specifications published by the Patent Office on Thursday was one by S. G. Brown and others for a telegraph relay with continually vibrating contacts.—I. Kitsee covers the use of graphite contacts for telegraph relays.—The manufacture of flame carbons with a tubular hard core and an outer sheath of flaming material is described by F. M. Lewis.—Marconi's Wireless Telegraph Co. cover the use of receiving circuits tuned to the group frequency of the trains of waves.—In spite of opposition, patents have been granted to J. H. Howden & Co. for an exhaust steam accumulator in the form of a boiler intermediate between the high-pressure engine and the low-pressure turbine. (Page 564.)

A FINE catalogue of switchgear, transformers, and accessories, just issued by Ferranti, Ltd., constitutes a new departure in catalogue compilation. (Page 565.)

AN offer by an American company to erect a wireless

Digitized by Google

station at Hong Kong has been refused by the British Government. A wireless news agency is to be inaugurated by Marconi's Wireless Telegraph Co. (Page 565.)

BELFAST Corporation will contribute £20 towards the proposed Municipal Wiring Bill.—A large electric power scheme is to be undertaken in Bombay.—Keighley Tramways Committee recommend postponing further tramway extensions in order to investigate trolley omnibuses.—An arbitration will shortly be held in London regarding the proposed conversion of the Dolter surface contact system at Torquay to the overhead system.—Complaints are being made as to the lack of electric supply in Newark.—Stockholm municipality have agreed to the introduction of trolley omnibuses. (Page 567.)

LOANS are to be taken up for electrical extensions as follows: Gravesend (£11,000); Halifax (£10,000); Bury St. Edmunds (£1,463); Littleborough (£2,800); Peterborough (£2,100); Bispham (£9,855); and Todmorden (£300). Six new tramcars are required at Wigan; and telephone cable, instruments, and switchboards by the Australian Government. (Page 566.)

THE receipts of the Mersey Railway Co. have increased by 120 per cent. since the introduction of electric traction. The Yorkshire Electric Power Co. show a net profit of £2,612 for the June half-year. (Page 569.)

MUSSEL BEDS AT THE BRIGHTON ELECTRICITY WORKS

Condenser Pipes Stopped

MR. J. CHRISTIE, Chief Electrical Engineer to the Brighton Corporation, reports serious trouble with mussel spawn and other marine growth in connection with the condenser circulating system at the Southwick electricity works. There is a five-foot suction pipe from the harbour, which, some ten feet inside the face of the quay, branches off into two 30-inch pipes. The works diver went up the five-foot pipe as far as the branch, and reports that beyond it there are clusters of large mussels and other marine growth, some seven inches thick, all round the inner surface of the pipes. This reduces the effective bore of the 30-in. pipe to some 16 ins., greatly restricting the flow of water to the condensers, and putting an overload on the pumps and motors, which they were never designed to carry, in order to circulate sufficient volume of cold sea water to maintain the high vacuum necessary for the efficient operation of the turbines.

In the absence of Mr. Arthur Wright, the Corporation's consulting engineer, who, unfortunately, is detained in South Africa by illness, Mr. Christie has discussed the matter with Mr. Wright's deputy, and has also consulted several expert marine biologists, and a few station engineers who have to work their plant under somewhat similar conditions. They all agree that there is no cure for this trouble except scraping the growth off the pipes by some mechanical means. It is quite impossible to do this at Brighton, and the only alternative is to provide a new system of pipes laid above the floor, with suitable manholes to give access to them for the periodical scraping and removal of any growth that may accumulate. The new turbine, which will shortly be erected, was originally intended to be coupled up to the existing circulating system. In view, however, of this unfortunate development, Mr. Christie deems it advisable to connect it up to an entirely new system of piping. Messrs. Richardsons Westgarth & Co., Ltd., who are supplying the turbine, have offered to carry out the new piping arrangement at a cost of £870, and the Electricity Committee recommend that this be accepted.

Although Mr. Christie thinks he will be able to get through the coming winter without dealing with the existing machines in this way, he recommends that tenders should be invited for running a new piping system to all the other turbines, the estimated cost of which is put at £1,800, exclusive of excavation and erection, which is put at £200. In this the Electricity Committee also concur.

The Brennan Mono-rail System.—Mr. L. Brennan has been awarded the Grand Prize by the Japan-British Exhibition authorities for his gyroscopic mono-rail system.

CORRESPONDENCE

THE ASSOCIATION OF CONSULTING ENGINEERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—In reply to your request for my views with respect to the new Association of Consulting Engineers, I have for a long time thought it necessary to have some sort of association that will look after the interests of the consulting profession.

At the present moment commercial travellers—in fact, anybody who is out of a job—seem to practise as consulting engineers; but perhaps the most serious stigma to the profession is the way in which the insurance companies carry on their consulting business. It is well known that they utilise their boiler inspectors and their commercial travellers to find out if there is any insurance work to be done—which is their legitimate business. But they go further than that, and ascertain if there is an opportunity of obtaining any consulting work; this is done in the name of the company. Now, if I or any other consulting engineer were to employ commercial travellers to go round and seek for jobs—utilising some other subterfuge, such as goods to sell, for obtaining an *entree*—I should at once be cashiered by the Council of the Institution; but the Councils of our Institutions seem to allow it to be done in the manner I have set forth, to the detriment of the consulting engineers, by any who like to form themselves into a company.

Although I have nothing to grumble at with respect to the amount of work I have in hand, I am constantly hearing from my professional *confrères* that they scarcely have a job in the office, and I cannot help thinking that this is largely due to the fact that there is no association to look after the consulting engineers' interests. We continue to pay our subscriptions to the various institutions, but fail to get any protection so far as our own profession is concerned.

By the same post as your letter came another letter from a man who is endeavouring to sell boiler composition covering, and I enclose his letter herewith: You will notice he is an Associate Member of the Institution of Civil Engineers, and styles himself as "Civil and Mechanical Consulting Engineer." Is it any wonder that so many consulting engineers find it hard to make a respectable and honest living when the institutions which we support allow such a thing to take place.

I regret that the founders of the Association of Consulting Engineers consider the only qualification necessary is to belong to the Civil Engineers; I should have thought it would have been better if they had required their members to have carried out important works when practising as a consulting engineer.

For my own part, there are already far too many institutions, none of them doing us any good in keeping up the status of the profession.

Yours faithfully,

HORACE BOOT.

4 Great George Street,
Westminster, S.W.
Aug. 22, 1910.

The letter sent by Mr. Boot for our inspection is dated from a suburban address, and reads as follows (we have omitted the names) :—

. . . . . , A.M.Inst.C.E.,
Civil and Mechanical Consulting Engineer.

DEAR SIR,

. . . . . Coy., Ltd., and . . . . . .

During my Sojourn at . . . . . , I saw they were putting down a New Boiler etc. at the Princess Hotel, on inquiry, I was told that you was the Consulting Engineer for the work, as there will be a little non-conducting covering work to be done I shall deem it a favour if you will Consider the above Coy. with whom I am connected.

I enclose you our No. 4 Catalogue giving particulars of the different classes of coverings.

Thanking you in anticipation

Yours faithfully

. . . . . .

Obituary.—The death occurred suddenly on Tuesday of Sir Charles Euan-Smith, K.C.B., C.S.I., a director of Marconi's Wireless Telegraph Co., and Chairman of the Marconi International Marine Communication Co. He was also chairman of the Cape Electric Tramways and Lisbon Electric Tramways Co., and director of the Chilian Electric Tramway & Light Co.

A NEW METROPOLITAN TELEPHONE EXCHANGE

Interesting Departures from Existing Practice

ON Saturday a new metropolitan telephone exchange will be opened by the Post Office, which, although of medium size, has several features of exceptional interest. It will be the first London exchange to adopt a 40-volt common battery in place

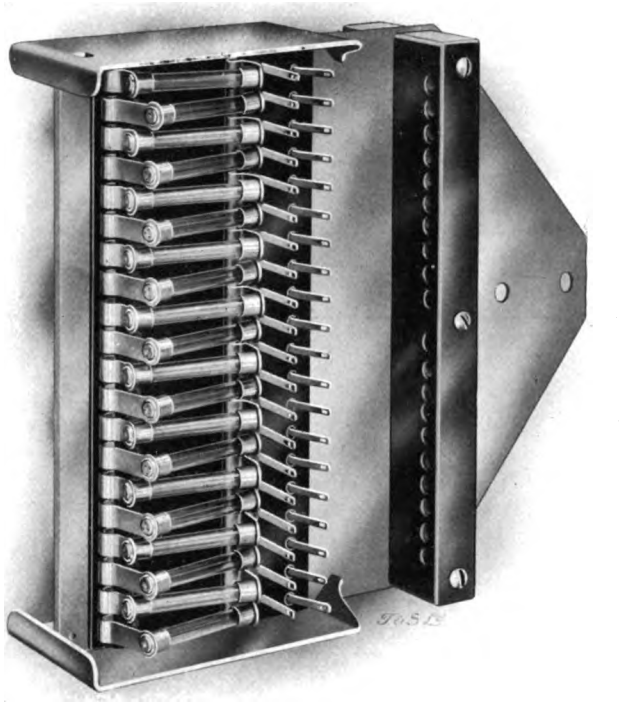

FIG. 1.—STRIP OF TWENTY PAIRS OF LINE FUSES.

of the customary 11-cell battery, and it will employ the new circuit introduced by the Peel-Conner Telephone Works, Ltd., at the new Glasgow telephone exchange (see ELECTRICAL ENGINEERING of August 18th, 1910), modified to suit London requirements. The equipment of the exchange has been carried out by the Peel-Conner Co. under the supervision of the Post Office engineers.

The exchange is in Willesden, and is equipped for 2,760 subscribers' lines with an ultimate capacity of 8,100. There are 208 in-coming junctions, 240 out-going junctions, and 40 in-coming order wires.

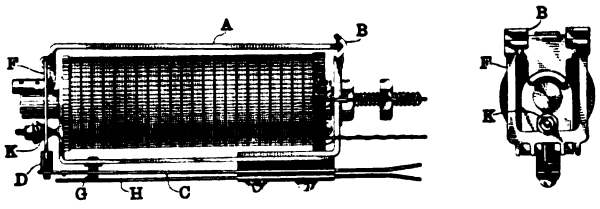

FIG. 2.—PLAN AND END ELEVATION OF RELAY. (HALF SIZE.)

The new features in design start at the main distributing frame on which, as at Glasgow, both the line and exchange side are arranged vertically, and the cables come up on the exchange side of the frame and are led across to the line side within the horizontal channel iron of the frame, leaving a clear space for the "jumper" wires. The same new type of fuse fitting is employed, each strip containing 20 pairs of glass-tube line fuses "staggered" as shown in Fig 1. (This figure is slightly less than half-scale; the actual length of the mounting strip for 20-line fuses is 8½ ins.)

Fig. 2 is a drawing of the relay employed throughout the circuits; we published a perspective view in our description of the Glasgow exchange, but the drawing—which is to scale—shows the construction in greater detail and also indicates clearly the method of adjustment. The armature *A* is hinged in simple manner at *B*, and is controlled by the flat brass spring *C*, which is an extension of the connection tab, and also carries one of the contacts. It presses the

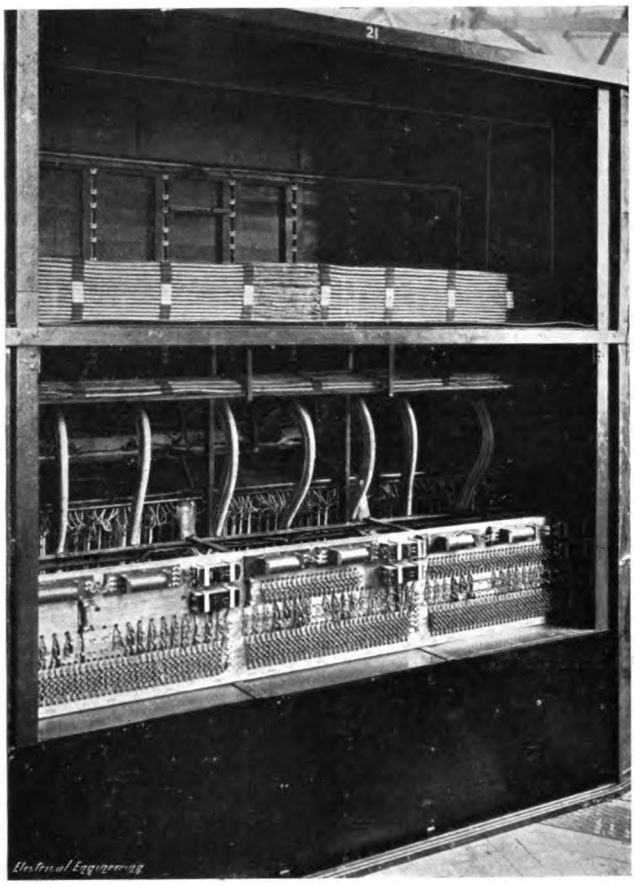

FIG. 3.—BACK OF SUBSCRIBERS' SWITCHBOARD.

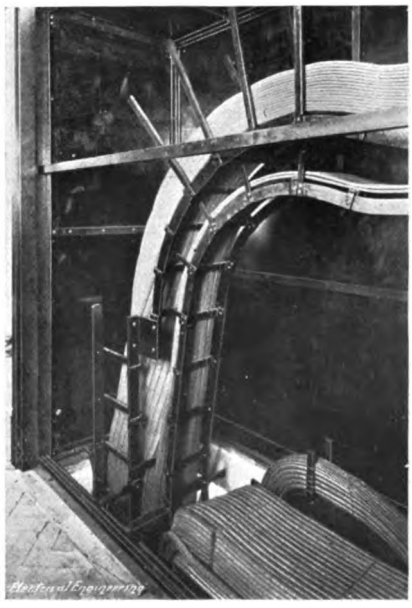

FIG. 4.—CABLE-TURNING SECTION.

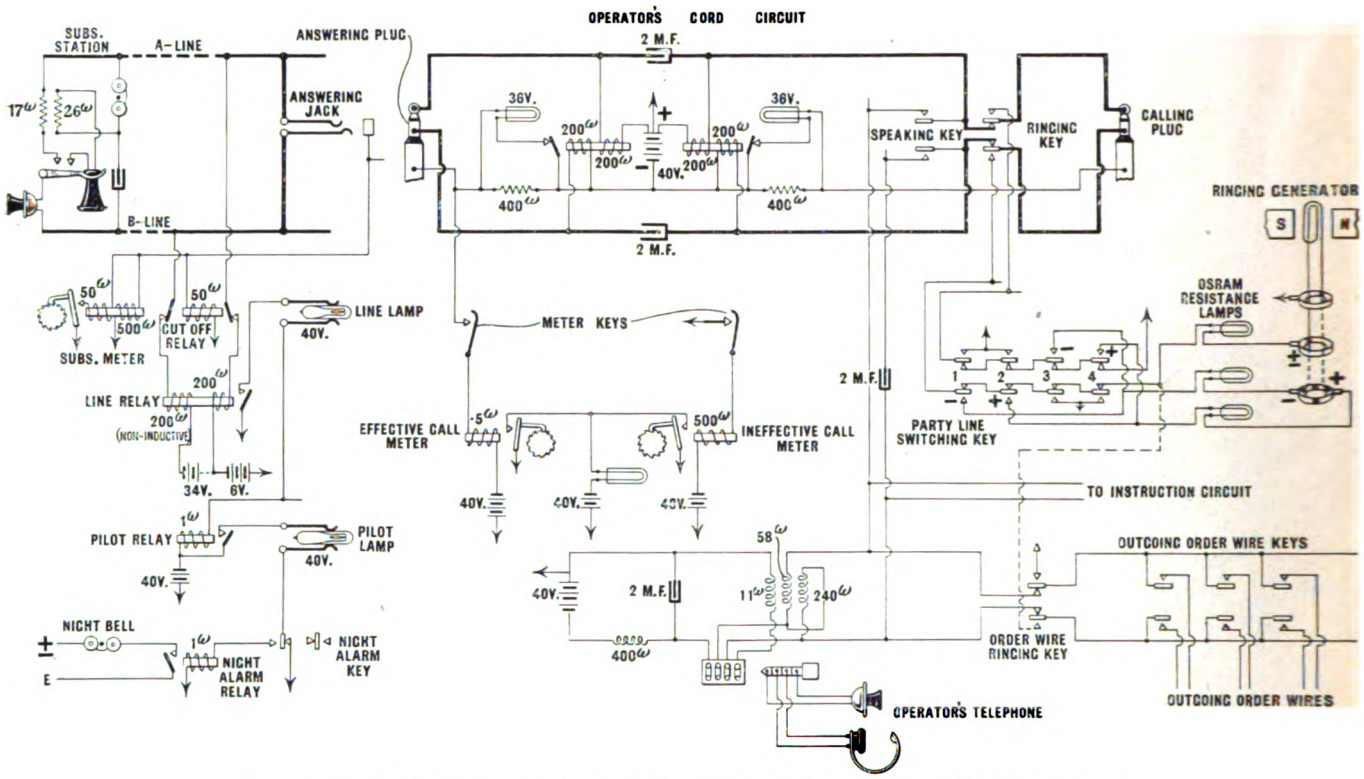

FIG. 6.—DIAGRAM SHOWING SUBSCRIBERS' LINE AND OPERATORS' KEYBOARD CONNECTIONS.

armature outwards through the small ebonite piece *D*, which is fixed to the stirrup *F*. *G* is merely an ebonite distance-piece to keep the lower contact spring *H* in position, and the spring *C* has a hole in it just sufficiently large to allow it to clear *G* as it moves backwards and forwards. The end of the armature is brought inwards and curved to embrace the extension of the core of the coil, and this end of the armature is shod with thin sheet brass to prevent sticking. All the iron parts are galvanised. It is seen that this is a considerable departure from the knife-edge type of relay, and that its construction is of such a stiff mechanical nature as to withstand a considerable amount of handling in erection without its requiring readjustment. The adjustment is, however, not the least ingenious part of its design. A conical nut *K* with a lock nut is placed on a set-screw in the brass bracket which supports the coil and core. The stirrup

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "The Editor, Electrical Engineering, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

THREE-PHASE WINDER AT ABERCWMBOI COLLIERY

THE Abercwmboi Colliery is one of a group of nine pits in the Aberdare Valley some 20 miles north-west of Cardiff, worked by the Powell Duffryn Co. A comprehensive system of electrical supply for the whole group from a central generating station was inaugurated in 1905, and the electrical equipment of the station and of the collieries was described in a Paper read the following year before the Institution of Electrical Engineers by Mr. Charles P. Sparks, the consulting electrical engineer to the company. Since that date the plant, both in the power station and in the collieries, has been considerably extended, and the total number of motors installed (all three-phase) for winding, haulage, pumps, fans, air-compressors, &c., is now more than 130, representing over 9,300 brake horse power.

The subject of this article is one of the very latest additions to the plant—a three-phase main winder installed by the A.E.G. Electric Co. at Abercwmboi under Mr. Sparks's supervision. This winds from a depth of 230 yards, and is designed for a nett output of 194 tons of coal per hour. Each cage, weighing 30 cwt., carries two 10-cwt. trams, each holding 27 cwt. of coal. The winding rope weighs 3·5 lb. per foot, and a balance rope of equal weight is provided. For the purposes of determining the requisite size of the winding motor, the following conditions were assumed: A nine-second period of acceleration with an average expenditure of 630 h.p.; a drop of 19·5 seconds at the full speed of

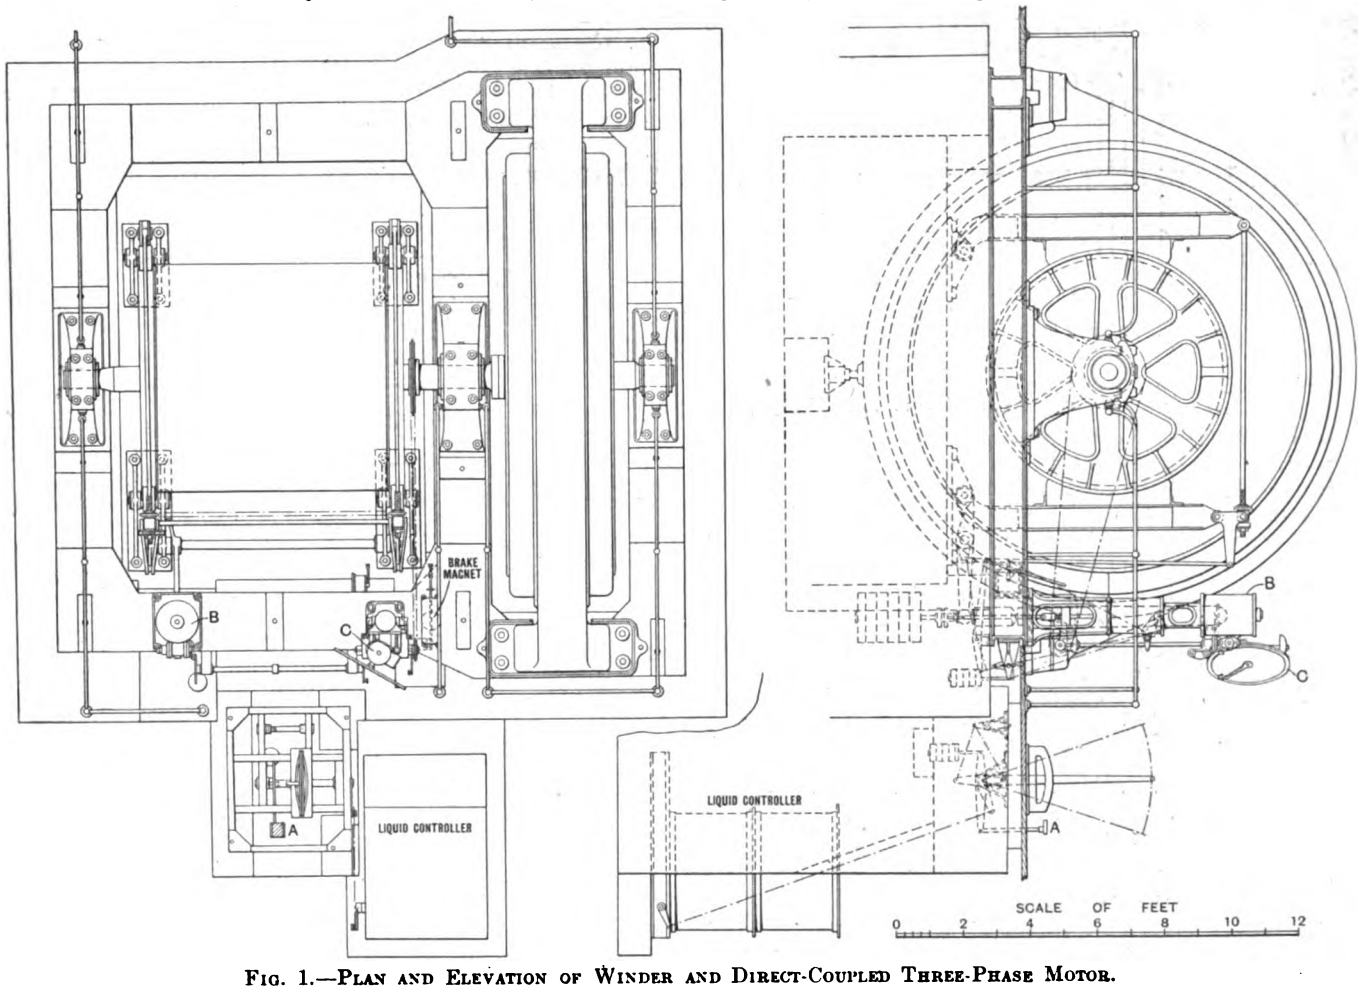

Fig. 1.—Plan and Elevation of Winder and Direct-Coupled Three-Phase Motor.

Digitized by Google

26 feet per second, during which the power required would be 345 h.p.; and a seven-second period of retardation. Including a stoppage of 14·5 seconds, this gives a total time of 50 seconds per wind. The motor installed has a continuous rating of 375 h.p., and develops a starting torque equivalent to 650 h.p. When we inspected the plant a week or so ago, the instruments indicated an average current of some 110 amperes per phase at 3,000 volts during the accelerating period,

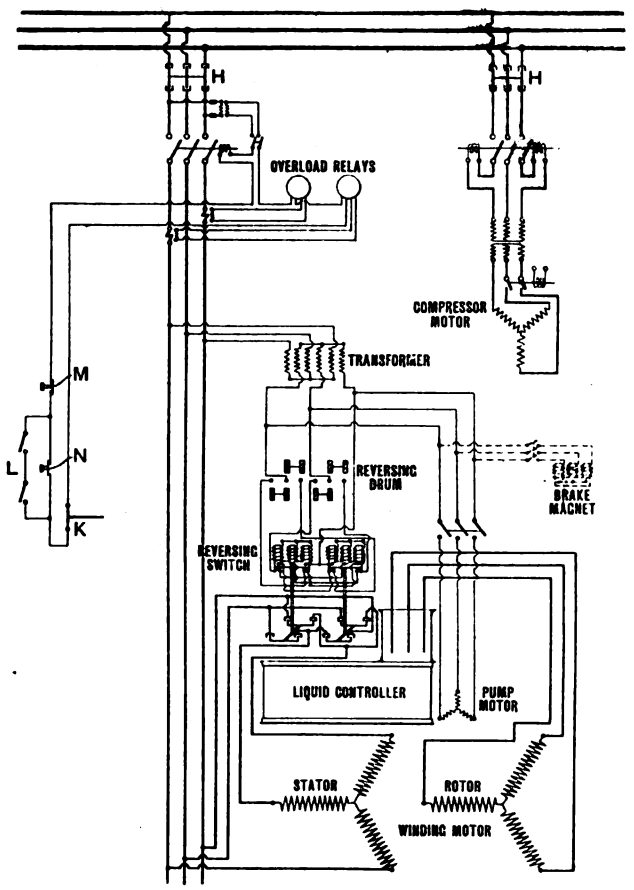

FIG. 2.—DIAGRAM OF CONNECTIONS.

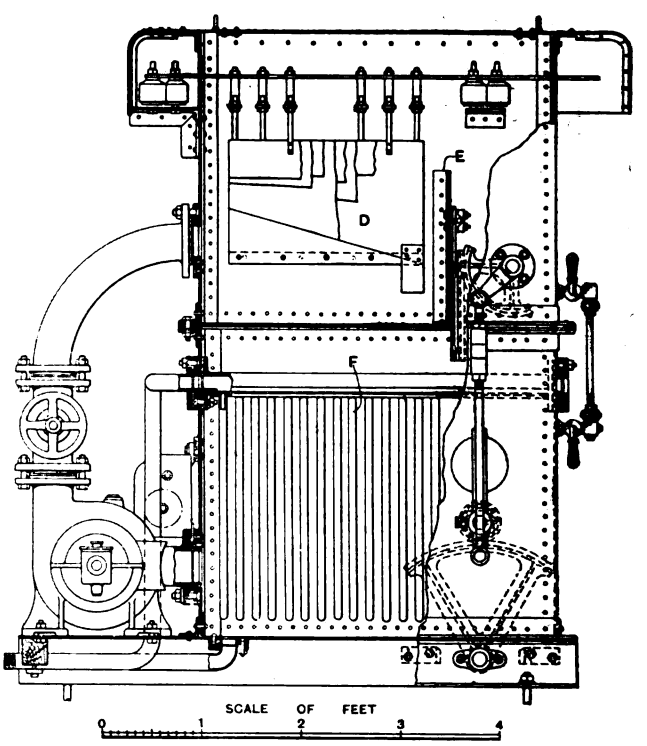
which fell to from 60 to 75 amperes during the full-speed period. The winding motor is connected direct to the 3,000-volt distribution mains without the intervention of any flywheel load-equalising plant, so that this load, fluctuating between zero and some 400 kw. (perhaps some 550 k.v.a.) every 50 seconds, is thrown direct on to the main generators. A Tirrell regulator is employed at the station, however, and the pressure is maintained sufficiently constant to prevent any trouble with the other plant. The average power-factor of the motor is, we are informed, about 0·76. We understand that when the winder is operating at full load, *i.e.*, 54 cwt., the *approximate* consumption is 3·44 kw. hrs. per wind, or some 1·275 kw. hrs. per ton of coal raised. We are also informed that the full-load efficiency is about 87 per cent.

The mechanical portion of the winder, by Messrs. Fraser & Chalmers, Erith, is illustrated in Fig. 1. It comprises a steel drum 7 feet in diameter and 7 feet wide, over which is wound the 1¼-in. steel wire rope. At full speed the drum rotates at 72 r.p.m. On either side of the drum are two massive wooden brake blocks bearing on the rims. These are applied by heavy weights, and are normally held off by compressed air supplied by an electrically driven compressor. The valves of the brake gear, *B*, are worked by the driver by means of a foot-lever, *A*. To take off the brakes, compressed air is admitted to the upper cylinder of the gear, and this lifts the weights. To apply the brakes, the air is released, but to avoid a too sudden application of the brakes, a second cylinder is provided to act as a dash-pot. The compressed air is stored in a reservoir, which is fed from an intermittently working electrically driven 7-h.p. compressor supplied at 500 volts through a 5-k.v.a. transformer. As indicated in the diagram of Fig. 2, the compressor is started automatically when the pressure in the reservoir falls below 50 lb. per sq. in., while to avoid too frequent starting and stopping, it is not switched off until the pressure reaches 80 lb. per sq. in. The automatic starter comprises an air-operated relay, which closes a local circuit. This switches in the stator of the compressor motor, and also operates a three-phase solenoid starting switch in the rotor circuit. A fan retarding device is provided to ensure slow starting up. The compressor and its control gear are situated in the basement under the winder, where is also the starting and reversing switch-gear for the main motor.

The winding motor is a 3,000-volt, 50-cycle, 450-h.p. A.E.G. induction motor, bar-wound and provided with slip-rings and composition carbon brushes. Its no-load speed is 75 r.p.m., and its full-load speed 72 r.p.m. The motor is coupled direct to the drum, and is controlled by a single lever. This lever is mechanically connected with the main liquid starter, and also with a contact drum controlling the 500-volt operating solenoids of the main reversing switch. The latter is a 3,000-volt oil-immersed switch with main contacts of the plunger type, and auxiliary contacts to take the arc at break. We understand that the continual arcing makes it necessary to change the oil once every week. The liquid controller providing the resistance for the rotor circuit is shown in section in Fig. 3. It comprises an upper chamber containing the electrodes, *D*, and a lower chamber for the electrolyte, a solution of soda. The latter is continually pumped up from the lower into the upper chamber by a small ¼-h.p. centrifugal pump. A vertically sliding gate or sluice, *E*, is provided at one end of the upper chamber, and this



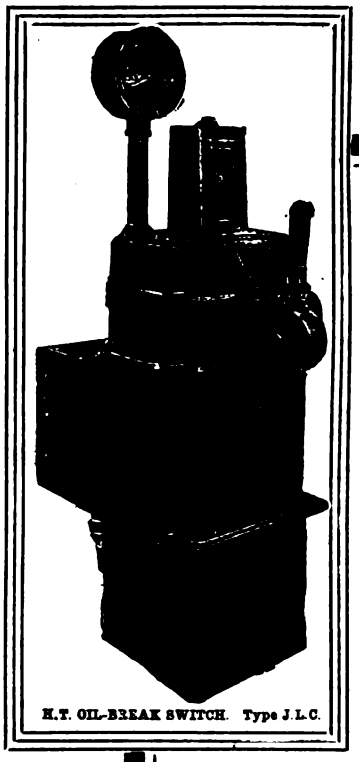


FIG. 3.—SECTIONAL ELEVATION OF LIQUID CONTROLLER.

is raised or lowered by the main controlling lever. On starting up the motor, the gate is slowly raised and the level of the electrolyte rises with it, gradually reducing the resistance between the plates. The elec-

PHŒNIX GEARED MOTORS

BRADFORD . . . 952 Central.
LONDON . . . 1061 Victoria.

IMPORTANT!

The strong, heavy sub-base in which the gearing runs, gives a solidity and freedom from vibration quite unattainable with a top geared type machine. Our Bulletin E E 1, shows many examples of recent PHŒNIX EQUIPMENTS.

PHŒNIX DYNAMO MFG. CO., Ltd., BRADFORD.

Digitized by Google

trolyte is continually overflowing into the lower chamber, and is there cooled by a system of water-circulating pipes, *F*. This controller is capable of maintaining a speed of 2·34 r.p.m. with one-tenth normal torque for a period of 15 minutes for inspection of the rope, &c.

For indicating to the driver the position of the cage and for preventing overwinding, a Whitmore overwinding gear is provided. This is shown at *C* in Fig. 1, and comprises a dial and nuts moving along two vertical threaded rods, which are set in rotation from the winder shaft by chain gear. Should either nut reach the top (which would happen if the cages were overwound), a switch (*K* in Fig. 2) in series with the no-voltage relay of the main switch is opened. The power is instantly cut off and a three-phase brake magnet operates the compressed air brakes. It will be noticed that the brake magnet only operates when overwinding takes place, or when the supply fails.

The general connections of the winder are shown in Fig. 2. A 75-mm. 3-core cable is led in underground from the sub-station at Abercwmboi, where the main 3,000-volt overhead feeders of the ring distributing system are brought in, and where the necessary switchgear and lightning protection apparatus is installed. From the main 'bus-bars in the winder house, the current passes through air-isolating switches, *H*, to the oil switches of the winder and compressor circuits for 200 amp. and 3 amp. capacity respectively. A voltmeter, a watt-meter, and an integrating watt-hour meter are provided, but are not included in the diagram. The local circuits of the two time-element overload relays in two of the phases are in series with the no-voltage release of the main oil switch, two limit switches, *L*, at the pit head, and a push-button emergency switch, *M*, on the driver's platform. Each of the relays is set to break the local circuit at 130 amps. after 23 seconds, and as the discs were continually commencing to rotate, the current per phase must frequently exceed this for periods of two or three seconds. The pressing of the emergency switch, the opening of the limit switches at the pit-head, failure of supply, or the operation of the switch of the Whitmore overwinder, all result in the motor being switched off and the brakes applied. A second push-button switch, *N*, is provided on the driver's platform. This short-circuits the limit switches, *L*, in order that the winder may be worked and the cages set in motion so as to move them away from the limit switches, which can then be closed again.

At the same colliery is a second but smaller electric winder over the up-cast shaft. This is used mainly for winding men four or five times a day only. The 3,000-volt, 125-h.p., three-phase motor is geared to the drum, and is controlled by an ordinary resistance starter.

In concluding this article, we should like to acknowledge our indebtedness to Mr. E. M. Hann, the Engineer and General Manager of the Powell Duffryn Co. for giving us permission and affording us facilities to inspect the winder, and to Mr. J. W. Price, the mechanical engineer to the Aberdare Valley group of collieries, and Mr. W. L. Harliss, his assistant, for conducting us over the plant.

Electric Shot-Firing Accidents during 1909. The annual report of H.M. Inspectors of Explosives records no less than 367 accidents in connection with shot-firing in mines and quarries during 1909. Of these, however, only seven were cases of electric shot-firing. These resulted in two deaths and injuries to eight persons out of a total of 40 deaths and injuries to 397 persons. All except one of the seven electrical accidents occurred in collieries where "permitted" explosives were used. One was caused by the firing leads accidentally coming in contact with the terminals of a dry battery while the shot-firer was connecting the detonator leads to the cable. The other six were caused by the shot being fired before the persons near the shot-hole had taken cover.

REVISION OF THE SPECIAL RULES FOR ELECTRICITY IN MINES

NO further evidence will be heard by the special departmental committee appointed by the Home Secretary to inquire into the working of the existing special rules for the use of electricity in mines, and to consider the advisability of their amendment. The sittings of this committee at the Home Office, Whitehall, have been of a strictly private nature, but we understand that the proceedings, comprising the evidence of some forty witnesses, will be printed and published. When the committee resumes its sittings in the autumn, the draft report of the chairman, Mr. R. A. S. Redmayne, H.M. Chief Inspector of Mines, will be under consideration, and it is expected that this will be presented to the Home Secretary before the end of the year. The other members of the committee, besides Mr. Redmayne, are Mr. C. H. Merz and Mr. R. Nelson, H.M. Electrical Inspector of Mines.

MINING PATENTS OF AUGUST

AMONG the patent specifications of interest to mining engineers published during August was one (No. 17,235 of 1909) by H. Hirst, of Dewsbury, for an electric coal-cutter especially adapted for narrow work, such as the driving of headings for roads. The machine is carried by means of two pairs of wheels running on the lower flanges of two side channel girders. The latter are carried by uprights from cross sleepers, and are provided with spikes which fit into holes cut in the face of the heading. A toothed wheel on the machine engages with a rack on one of the girders. The swivelling carrier which carries the cutter bar spindle is cast in one piece with a large worm-wheel geared with a worm carried at the forward end of a longitudinal shaft passing along one side to the rear of the machine and provided with a handle.

Patent No. 9,543 of 1910, by H. Friese, of Bochum, Germany, covers a device for indicating the presence of fire-damp by means of a selenium cell and a safety lamp. When the air contains only a slight proportion of fire-damp, the intensity of the flame is increased, and when a large proportion, the intensity is decreased. Either variation is caused to actuate a signal by means of a relay in series with the selenium cell and a battery.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during August.

Aug. 4th.—Supplement on "Electrical Engineering in Mines," opening with an article on colliery supply in Northumberland and Durham and the work of the large power companies in that district. A short account of a visit to the electrical installation at a lead mine. Some extracts from the reports of H.M. Inspectors of Mines, and an abstract of a Paper putting in a plea for the use of earthed concentric cables in collieries. Articles dealing with American regulations for electricity in mines, mining cables, and accessories and mining patents published during July.

Aug. 11th.—Some notes on the care of commutators, and a description of a safety device to enable repair work to be done on live overhead high-tension lines. An article discussing the possibility of an Association of Motor Manufacturers on the lines of the Cable Makers' Association.

Aug. 18th.—An illustrated description of the Grille water-tube boiler. Particulars of the courses at the various Universities and Technical Colleges in the provinces. Correspondence with regard to the newly formed Association of Consulting Engineers.

Aug. 25th.—An article criticising the current practice in the design of high-tension cellular switchboards. Particulars of the courses in electrical engineering at the various technical colleges in London. A description of a new flame arc lamp.

Tyndall Studentship.—The first year's income of the Tyndall Mining Research Fund, established in memory of the late Prof. John Tyndall, will be devoted to the establishment of a studentship for study and research on subjects relating to mining and the safety of miners. The value will be about £35. It will be open to any British subject. The applicant should state the particular kind of research he proposes to carry out, his qualifications, and the place where he intends to carry on the work. The application, which should be sent in to the Assistant Secretary of the Royal Society not later than September 15th, 1910, should be accompanied by not more than two testimonials or references in its support. The student elected will be at liberty to follow his ordinary avocation if it is consistent with the aims of the studentship.

Digitized by Google

F rests on this nut in its normal position, and by turning the nut in one direction or the other a very delicate adjustment is obtained of the distance between the core and the curved projection of the armature.

In the construction of the switchboard, the fire-proof arrangement adopted by the Post Office is used. Fig. 3 shows a portion of the back of the subscribers' switchboard with the protecting covers removed, Fig. 4 the cable-turning section, and Fig. 5 the front of one of the apparatus racks in the space behind the subscribers' switchboard. In accordance with Post Office practice, these racks contain the relays, resistances, and condensers, which are no longer fixed on the back of the switchboard.

Fig. 6 is a diagram of the subscribers' line and operators' keyboard connections. The difference between this and the circuit fully described in our issue of August 18th, is an alteration to adapt it for use on the London system, of which the extended use of small private branch exchanges is a feature. The A-line side of the line relay, which is connected to the earthed side of the battery in the Glasgow circuit, is connected here to a six-volt tapping; and the B-line side of

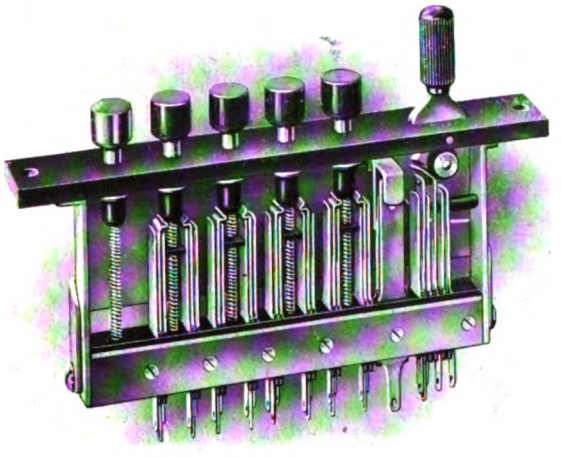

FIG. 8.—SET OF RINGING KEYS FOR JUNCTION BOARD.

the line relay is wound non-inductively. Current can thus be taken from between the B-line and earth to work a small private branch exchange without actuating the line relay or affecting the proper working of the cord circuit.

The subscribers' board is made up in eight-panel sections, with nine-panel multiples, and three operators' positions per section. There are six sections, the last being partly equipped. Seventeen pairs of cords are provided per position. Except in the points that have been mentioned, the equipment of the subscribers' board is similar to that at Glasgow. The local jacks are at ¾-in. centres allowing space for labels, and the multiple jacks at ⅜-in. centres. The junction board (Fig. 7) has nine-panel sections, with nine-panel multiples, and three positions per section. The illustration shows the set of five ringing keys on each junction cord, and Fig. 8 indicates the construction of the keys.

In conclusion, a brief reference may be made to the remainder of the equipment of the exchange and the general lay-out. The cables entering the exchange are all underground; they are joined up in the basement through the usual lead sleeve joints with an inlet for air-drying, to lead-covered silk and cotton cables in the ordinary way, and the latter come up to the main frame and where they are terminated in the manner already described. The apparatus-room occupies a large space on the ground floor of the building, and in addition to the main frame, wire-chief's desk, the I.D.F., and the relay and condenser racks, &c., contains at the far end the power plant, switchboard (both supplied by the General Electric Co., Ltd.), and the ringing generators; the battery room (E.P.S. cells) is adjacent. The switch-room is on the first floor, and is lofty and well lighted from the roof, there being no floor above it.

ELECTRIC TRACTION IN JAPAN.—It is stated that a company has been formed to construct an electric railway between Tokio and Yokohama. The line is to have a length of about 15 miles, and a branch line nearly four miles long is to be built to Kamata, on the State railway. The line will be double track on a 3 ft. 6 in. gauge. The cost of construction is estimated at about £357,300.

ELECTRICAL TRADE WITH RUSSIA

A BRITISH Consular report dealing with the trade of Russia during 1909 makes some interesting remarks concerning British trade with that country, which, although of general application, are pertinent to the electrical industry in view of the increasing use of electricity there. Mr. Vice-Consul C. Blakey, reporting upon the Kharhoff district, suggests the formation of a limited company with an establishment, say, in Moscow, to cover all kinds of engineering supplies. Such an office, he is convinced, could be relied upon to do a trade and to look after the interests of the manufacturers far more satisfactorily than an agent. The idea is not new, but to get over the difficulties it is necessary to find a group of manufacturers who wish to trade in Russia, and are convinced of the incapacities and limitations of travellers and agents.

Reporting on trade with Odessa, Mr. Consul-General C. S. Smith states that electrical enterprise in Russia seems unattractive to British firms. Electric tramways are a Belgian speciality; there are Belgian concessions or installations (or both) in many towns—Odessa, Kursk, Kharkov, Nikolaiev, Sevastopol. Electric installations of other kinds seem to be mainly German. He has heard of one German firm which is believed to have had a turnover in 1909, mainly in the Donetz district, of about £300,000. It sold 20 steam turbine generators of 500 to 1,200 kilowatts. A considerable trade in electric lamps and fittings is going on in the Kharkoff district, especially in the Donetz mining district, and with the sugar factories. At Nicolaiev the municipality are raising a loan of £1,000,000, one of the chief objects of which is to buy out the horse tramway company and convert the lines to electric traction. A sum of money has also been assigned for the improvement of telephonic communication between Nicolaiev and Odessa.

Australian Tramways.—According to an American Consular report, there were 226 miles of electric tramways in Australia at the end of 1909. These were distributed as follows:—New South Wales, 105 miles; Victoria, 34 miles; Queensland, 31 miles; Western Australia, 47 miles; Tasmania, 9 miles. The total gross revenue of all these systems during 1909 was £1,400,000.

Electric Lighting Provisional Order Applications.—The Board of Trade have issued some new rules relating to applications for electric lighting provisional orders. These differ in some important respects from the old ones, although the general procedure is the same. Applications in future must be most complete in their details, the deposits with the Board of Trade including a statement showing that a definite scheme (including an estimate of the cost) for the supply of electricity, in the case of municipalities, has been prepared and considered, and a report by an electrical engineer on the proposed scheme. In the case of a company, a statement of the capital proposed, and the manner in which it will be provided, has to be put in. The usual fee of £50 has been reduced to £35, but if additional expense is incurred by reason of inquiries, &c., the amount is charged to the applicant. Applications by Joint Boards are on similar lines, with additional statements as to the proposed constituent authorities. The greater powers given to the Board of Trade to grant provisional orders under the Electric Lighting Act, 1909, are reflected in the provisions for orders relating to acquiring generating stations outside area of supply, compulsory acquisition of land, breaking up of roads, &c.

THE TRAMWAY BRAKES OF AUCKLAND.—A Royal Commission consisting of Prof. J. Scott and Mr. A. L. Beattie (Chief Engineer of the New Zealand Railways), appointed to report upon the brakes of the Auckland electric tramways, has sent in a report to the Government condemning the present equipments, recommending that pneumatic brakes and pneumatic sanding gear be fitted to all cars, and that the existing track brakes be reconstructed, so that it will be possible to transfer 45 per cent. of the weight of a loaded car to the slipper blocks. Magnetic brakes are said to be unsuitable on account of the construction of the Auckland cars, the cost of such equipments and the limiting effective speed. The standard of upkeep and efficiency at Auckland is compared unfavourably with that at Wellington, Christchurch, and Dunedin, and the appointment by the Government of an electrical inspector of extended experience in tramway working is recommended. It is also suggested that the Government should take powers to be able, if necessary, to insist on any tramway system being equipped and worked with due regard to the safety and convenience of the people. Apparently, therefore, there is nothing corresponding to Board of Trade regulations in New Zealand.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Aug. 25th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

17,739/09. **Automatic Pressure Regulation.** H. M. TAYLOR and R. H. SCOTSON (Middlesborough). To maintain the voltage of a machine at a constant value, a small booster and a resistance are connected in series with its shunt field winding. The field of the booster is connected in series with an adjustable resistance across the mains, and is short-circuited by an automatic solenoid switch when the voltage of the mains rises above a predetermined value. Five figures.

17,774/09. **Telegraph Relay.** S. G. BROWN, W. JUDD, and A. R. HARDIE (London). The speed of working and distinctness of the signals are increased by relieving the sluggishness of action at the contacts which are maintained in a continual state of vibration. This vibration of the contacts is obtained by electromagnetic mechanism independent of the relay. Thirteen figures.

17,999/09. **Wiring Conduit.** P. T. KENNY (New York, U.S.A.). This specification describes split metal wiring conduit which also serves as a picture rail. The body has longitudinal grooves to receive the cables, and a similar groove on the underside which fastens over the screwheads or other fixing devices projecting from the wall. A metal cover is sprung over the body. The groove on the underside is constricted, but has openings at intervals to receive the fastening device. Fourteen figures.

18,469/09 and 15,977/10. **Flame Lamp Carbons.** F. M. LEWIS (Brighton). The first patent covers a process of manufacturing flame carbons consisting of a tubular or solid core of hard carbon with an outer sheath of flaming material compressed over the core. Sixteen figures. The second patent covers a flaming mixture of equal parts of calcium flouride and silicon carbide with a binder of gold size. A sheath of this material 1·4 mm. thick is applied to a core 11 mm. in diameter with a 6 mm. central hole. After baking, the electrode is given a protective coating of water glass. Two figures.

18,922/09. **Wireless Telegraphy.** G. MARCONI and MARCONI'S WIRELESS TELEGRAPH CO., LTD. (London). Instead of tuning the receiving circuits to the period of the transmitted oscillations, they are tuned to the group frequency of the trains of waves. Two circuits inductively coupled, and containing a detector and a telephone respectively, are employed. An intermediate resonant circuit may also be used, all three circuits being tuned to the group frequency of the trains of waves. Four figures.

2,349/10. **Telegraph Relays.** I. KITSEE (Philadelphia, U.S.A.). To increase the sensitiveness of relays such as are used on submarine cables, the contacts are of graphite. A graphite disc is enclosed in a metal ring and revolved by an electric motor, while the contact attached to the coil consists of a thin aluminium wire with a graphite end. The contacts are bridged with a capacity of two micro-farads. Three figures.

8,831/10. **Trolley-wire Suspension.** M. JOLLINCK and J. F. DE TÓVÁROS (Budapest). When trolley wires are suspended by hangers from carrier wires and are kept in tension by weights acting on the ends of the sections, it is necessary to allow for longitudinal movement. This patent covers a yielding suspension or hanger comprising a wire connected to the carrier wire at two points and passing freely under the bolts of the trolley wire clamps. Four figures.

Opposition to Grant of Patents

25,231-2/07. **Exhaust Steam Accumulators.** J. HOWDEN & CO., LTD., AND W. H. OWEN. These two patents have been granted in spite of opposition. The first covers the use of a minimum pressure boiler intermediate between the high-pressure engine and the low-pressure turbine, which acts both as a steam accumulator and as a source of steam when the supply of exhaust steam fails. The second patent covers the use of a superheater between the steam accumulator and the turbine.

12,844/09. **Magneto Massage Machine.** B. SEACOMBE. This patent has been refused as the result of opposition. The specification describes an apparatus consisting of a roller with a corrugated metal surface, driving a magneto-generator through a gear train. By means of a contact-making device, an intermittent current is passed from the roller through the part being massaged, and back through the hands.

19,466/09. **Arc Furnace for Treating Gases.** SALTPETERSÄURE INDUSTRIE-GES. The grant of this patent has been allowed in spite of opposition. Between the main electrodes are two auxiliary electrodes, connected by a resistance. Each of the auxiliary electrodes forms with its adjacent main electrode an arc expanding device of the horn pattern. Should the main arc be blown out, two arcs are formed at the two horn devices, and expand out until they meet and thus restrike the main arc.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: SIEMENS BROS. & CO. and DIESELHORST [Insulator for high-tension circuits] 25,536/09; BRITISH THOMSON-HOUSTON CO. and WEDMORE [Protective arrangements for distribution systems] 6,668/10; BROWN, GATENBY, and GOURLAY [Conduit threaders] 10,705/10.

Dynamos, Motors, Transformers: OLMSTED [Speed-governing device for electrically-driven machines] 30,187/09; MARTIN [Motors] 2,894/10; SIEMENS BROS. DYNAMO WORKS, LTD., and PARKER [Ventilation of D.C. machines] 8,409/10; ALLGEMEINE ELEKTRICITÄTS GES. [Centrifugal air-pumps and compressors] 12,338/10; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*) [Prevention of residual magnetism in machines] 14,153/10, and [Production of braking action in polyphase commutator motors] 14,355/10.

Electrometallurgy and Electrochemistry: SAUVAGEON [Furnaces for continuous manufacture of glass] 18,118/09; PRESSER [Production of oxides of nitrogen] 7,319/10; POLITZ [Protection of pipes from electrolysis] 9,094/10.

Incandescent Lamps: BEUTIELL [Mounting of lamps] 24,950/09.

Instruments and Meters: HANSFORD and WRIGHT [Prepayment meters] 10,934/09; HEDLEY and DOYLE [Instrument for recording "coasting" time of cars] 485/10; SPRAGUE and CHAMBOTAIN & HOOKHAM, LTD [Prepayment meters] 5,250/10.

Storage Batteries: MARINO [Protection of lead supports of positive plates from per-oxidation] 18,590/09.

Switchgear, Fuses, and Fittings: THOMAS and THOMAS [Switches] 15,681/09; JEVONS and GREEN [Circuit-breakers for welding machines] 18,036/09; FIELD and FERRANTI, LTD. [Switch contacts] 18,221/09; RORKE and RORKE [Switch] 18,687/09; BERRY and MARKHAM [Switch-fuses] 21,185/09; JÄHDE [Lamp-globes] 1,699/10; FELTEN & GUILLEAUME LAHMEYERWERKE A.-G. [Limit-switches] 2,432/10.

Telephony and Telegraphy: COLIN and JEANCE [Wireless telephony] 18,436/09; MARCONI and MARCONI'S WIRELESS TELEGRAPH CO. [Transmitters] 18,524/09, and 20,229/09; SIEMENS BROS. & CO. (*Siemens & Halske A.-G.*) [Telephone exchange circuits] 11,251/10.

Traction: CONSOLIDATED BRAKE & ENGINEERING CO. [Brake mechanism] 18,696/09; STAHL [Signalling apparatus] 7,143/10; HEILMANN [Brake] 8,989/10.

Miscellaneous: MORISON [Condensing plant] 11,043/09; HOPE-JONES [Electric clocks] 18,405/09; HUTCHINSON [Magnetic separators] 18,420/09; LEAKE and RUSHWORTH [Fire alarms] 18,771/09; ROGERS [Audible electric signalling] 23,802/09; SCHERL [Gyroscopic apparatus] 27,840/09; HARLÉ ET CIE. [Reproducing movements at a distance] 28,164/09; OTIS ELEVATOR CO. (*Otis Elevator Co., U.S.A.*) [Ammunition hoists] 29,132/09; PATHER IRON & STEEL CO. [Clutch for rolling mills] 4,484/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: HEIMANN and SCHÄFFER [Working arc lamps in series with incandescent lamps] 11,581/10.

Electric Ignition: R. BOSCH [Sparking-plugs] 13,901/10.

Storage Batteries: ACCUMULATEURS TUDOR SOC. ANON. [Packing charged negative plates for transport] 18,398/10.

Miscellaneous: AUB [Electrodes for electro-medical apparatus] 15,634/10.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: W. ARMISTEAD and M. J. TILNEY [Booster-battery or flywheel load-equalising systems] 9,940/05; W. S. SMITH and W. P. GRANVILLE [Cables with leakage resistances] 10,047/05.

Dynamos, &c.: MORGAN CRUCIBLE CO. and C. W. SPEIRS [Plumbago commutator brushes] 9,875/05; SIEMENS BROS & CO. (*Siemens-Schuckertwerke Ges.*) [Ventilation of machines] 10,085/05; H. LEITNER and R. N. LUCAS [Train-lighting system with A.-C. generator and rectifiers] 10,118/05.

Electrometallurgy, &c.: A. VOELKER [Resistance furnace] 10,873/04.

Switchgear, &c.: G. W. MASCARD [Motor-operated switches] 10,652/03; P. C. HEWITT [Control of vapour rectifiers] 8,972/05.

Telephony, &c.: E. J. STELJES [Type-printing telegraphs] 10,575/04; P. J. KENNY (*E. Molyneux, India*) [Field telegraph and telephone apparatus] 9,702/05.

Miscellaneous: G. GREGORY, N. H. ELLIS and P. E. PLATER [Signalling lamp] 10,550/04; G. DONINGER [Electric lamp for illuminating targets] 10,103/05.

Digitized by Google

SWITCHGEAR, TRANSFORMERS, AND ACCESSORIES

IT has been our duty—sometimes a pleasant one, sometimes the reverse—to read and review many catalogues, but seldom have we seen such an excellent production of this nature as the one just issued by Ferranti, Ltd. (Hollinwood, Lancs.). An entirely new arrangement has been adopted. Each section not only contains a catalogue and price list, but also descriptive and technical articles on the apparatus in question and its uses; the intending purchaser is fully educated in the details of what he is buying, and is afforded the clearest possible guide to making a proper selection. The engineering staff, and notably the Chief Engineer himself (Mr. M. B. Field), have taken a leading part in its compilation. In spite of the size of the book and the large amount of ground it covers, the arrangement and indexing is such that a reference to any particular matter is quick and easy.

The catalogue is in the form of a substantial file made up of a number of pamphlets, some of them price catalogues, and others devoted to descriptions of complete switchgear installations or the discussion of technical points arising out of the proper use and purpose of various devices. It is divided into seven sections, dealing respectively with measuring instruments, relays, transformers, switches and plug gear, rheostats and motor-starters, fuses, and, lastly, standard panels and sundries. A marginal index sheet and a sectional index are provided at the commencement of each section. All future pamphlets also will be marked with section, list, and page numbers, in order that the catalogue may be kept up-to-date; the file cover is designed to render their insertion easy, and considerable gaps have been left in assigning list and page numbers.

A novel feature of the catalogue is the chart index in the form of a genealogical tree provided in the instrument section. Thus, under the heading "wattmeters" are the three words "recording," "indicating," and "integrating"; each of these has "A.C." and "D.C." branches, each of which is again divided into "switchboard" and "portable," and in some cases "house service." These are again divided into further distinguishing characteristics. By following out the tree along the required features, one arrives at the list and page number of the instrument required with the minimum of time and trouble. In most of the other sections an alphabetical index or one arranged in an order dictated by the relations which the items bear to one another has been adopted.

Among the descriptive pamphlets is one describing the remote-control automatic high-tension A.-C. switchgear of the St. Andrew's Cross station of the Glasgow Corporation. Another deals with the heavy continuous-current switchgear installed in the Dickinson Street station of the Manchester Corporation in connection with the 12,000 ampere-hour storage battery, which was also fully described in ELECTRICAL ENGINEERING last April. Several other special types of switchgear are described and illustrated, including iron-clad high-tension gear, especially designed for collieries and mines. Among the other articles in the catalogue are a Paper on the use of electrostatic voltmeters as ground-detectors, and the determination of the neutral point of unearthed systems by Mr. M. B. Field, Chief Engineer to the company, and some "Technical Considerations regarding Watt-meter and Power-factor Measurements," especially prepared for the purpose by Mr. M. B. Field, which is a subject upon which many power station engineers will welcome accurate information of a kind not to be found in the usual text-books. Another particularly interesting section is that on relays. The purpose, construction, and operation of the various types are described, and a large number of diagrams and photographs of the mechanisms are given. The section on transformers covers auto-transformer starters, current and potential transformers for instruments and relays, static balancers, and power transformers up to 100 k.v.a. A descriptive pamphlet by Mr. Field discusses the use of current and potential transformers in conjunction with trip-coils and relays. For facilitating the choice of transformers for instruments, relays, trip coils, &c., a special pamphlet giving the volt-ampere consumption of the various patterns of these devices is provided.

The section on switches is most complete, the items listed ranging from small knife-switches to the heaviest automatic iron-clad oil switchgear with remote-control, and there is a similar completeness in the pages dealing with rheostats, motor-starters, switchgear accessories, and special switchgear. Every possible device is briefly described and illustrated, and a distinctive feature of the whole catalogue is the excellence of the illustrations which more often show the interior construction of the apparatus in question, and greatly assist the reader in grasping the method of working.

Euston-Watford Electric Railway.—One of the last obstacles in the construction of the electric railway from Euston to Watford was removed on Saturday night. The line has to cross the railway from Hampstead to Acton, which runs on an earth embankment. The necessary portion of this embankment was removed, and a girder bridge put in its place for carrying the Hampstead to Acton line over the new electric line.

WIRELESS TELEGRAPHY

AN American Consular report states that those interested in merchant shipping desire that a commercial wireless station be established in Hongkong, and the local Chamber of Commerce and many influential residents in the colony have strongly urged it. A proposal was made last year by an American company to establish a wireless station at Hongkong capable of communicating with Manila, Singapore, Shanghai, and Yokohama, and though they did not believe that the station would be profitable for some time they were prepared to bear the early losses in consideration of a licence giving them the sole right to conduct a commercial wireless telegraph business for 25 years, with the proviso that the Government should have the right to purchase the station and business at a valuation at the end of 10, 15, 20, or 25 years. The proposition was referred to the Colonial Office in London, but was not accepted. At present there are no facilities in the colony for handling commercial messages by wireless, although the American, German, and Japanese mail steamers calling at the port are being equipped with the apparatus.

A Press agency has been started by Marconi's Wireless Telegraph Co. for the distribution of news received from the principal liners at sea.

The Vienna correspondent of the *Globe* reports that Turkey is negotiating with the Marconi Company for the installation of a series of wireless stations along the coast, and also at various places in the interior, for the use of the Army and Navy in particular. It is added that all the Turkish warships will be fitted with wireless apparatus at an early date.

A Reuter telegram from New York states that a wireless message was successfully transmitted on Saturday from a moving aeroplane at a height of 500 feet, a mile from the Sheepshead Bay aviation track.

The Australian Commonwealth has read the first time the Navigation Bill, under which passenger ships, including those of foreign countries, may be required to instal wireless telegraph apparatus.

The Association of Mining Electrical Engineers: *Proposed Scottish Branches.*—A special meeting of the above Association will be held in Glasgow on September 17th, in order to promote the formation of one or more Scottish branches. The President, Mr. W. Maurice, General Mine Manager, Hucknall Colliery Co., Notts, and Messrs. J. Glynn Williams, H. W. Clothier, and H. J. Fisher will attend as a deputation from the Council. The meeting will be held at the Beaconsfield Room, Grosvenor Restaurant, Glasgow, at 6 p.m., Saturday, September 17th, and any gentlemen connected with the application of electricity to mining will be welcome. Mr. J. Glynn Williams will also hold informal meetings to explain the objects of the Association, as follows:—September 3rd, Victoria Hotel, Glasgow, 4 p.m.; September 5th, Royal Hotel, Dunfermline, 6 p.m.; September 6th, Milnes Hotel, Edinburgh, 6 p.m. There are already thirty-four Scottish members enrolled.

ELECTRIC STREET LIGHTING IN HAMPSTEAD.—In our article on the displacement of gas by electricity for street lighting in Marylebone, Hampstead, and Shoreditch, last week, we referred to the fact that in Hampstead the capital cost per post was higher than it would otherwise have been owing to the lamps being switched on by Venner time switches from sub-stations, which necessitated the laying of a switch-wire for each group of lamps. Messrs. Venner & Co. inform us that this extra cost is only to a very small degree due to the time switches themselves, the cost of which works out to less than 3s. per post.

ELECTRIC POWER IN THE TRANSVAAL.—In his presidential address to the Transvaal Institute of Mechanical Engineers, on July 16th last, Mr. J. A. Vaughan dealt chiefly with the question of electric power on the Rand, and expressed his approval of the new Power Act. The use of power on the mines which have contracted with the power companies for its supply is calculated, he said, to lead to a saving of over 10d. per ton crushed, this estimate referring to operations after October 1st, 1912, when the price per kilowatt hour is to be reduced to 0·525d. for 70 per cent. load factor or over. The mines which are not so contracting, but which have been formed into groups with sufficiently large power requirements to justify the erection of large central power stations, expect to obtain their power at an equally cheap rate. Mr. Vaughan estimates that, in a few years' time, the old figure of 2s. for power costs per ton crushed will be reduced by one-half. He also suggested that the extended application of electric haulage would tend to increase the ratio of white to native labour.

LOCAL NOTES

AUSTRALIA: *Perth Tramway Employees Strike.*—A strike of the tramway employees of the Perth Electric Tramways, Ltd., has been going on for the past six weeks. According to Reuter messages, the service is suspended, all the cables having been cut.

BELFAST: *Municipal Wiring.*—The Corporation have decided to contribute £20 towards the cost of the proposed Bill to confer wiring powers upon all municipalities.

Electrical Exhibition.—The Electrical Engineer is to report upon holding an electrical exhibition in the Ulster Hall, to demonstrate the use of electricity for lighting, power, and heating.

BIRKENHEAD: *Tramway Jubilee.*—Birkenhead has been celebrating the jubilee of its tramways, which were first introduced on August 30th, 1860, the original line having been the first to be constructed in this country by the late Mr. George Train. The line had a gauge of 5 ft. 2 ins., the rails projecting nearly an inch above the surface of the roadway.

BLACKROCK (IRELAND): *Electric Lighting.*—At the meeting of the Council last week, a letter from the Board of Trade was read asking what action the Council intended to take in regard to their Electric Lighting Order, which will shortly expire. After discussion it was decided to apply for a further extension of time.

BRAUNTON: *Electric Supply.*—Messrs. Crompton & Co. are carrying out an electric lighting scheme, and offer to supply the Council with current at 2·15d. per unit. At present the streets are lighted by oil.

GLASGOW: *Electricity Accounts.*—The accounts of the Electricity Department for the year to May 31st show a gross profit of £140,521. After meeting capital charges, there is a balance of £43,665, all of which, with the exception of £190, has been placed to depreciation. The number of consumers increased from 18,158 to 19,893 during the year.

GREYSTONES (IRELAND): *Public Lighting.*—The Council desire to enter into a contract with the local electric lighting company for public lighting, but have been informed by the Local Government Board that they have no power to spend money in this connection without a Provisional Order from the Board of Trade.

HALIFAX: *Proposed Tramways.*—The Tramways Committee suggest that Parliamentary powers should be sought next session for the construction of tramways up Westgate, along Southgate and Princess Street, and down Crossley Street into Northgate to join the present lines; the doubling of lines on various routes, and the revival of powers to construct tramways to Stainland and Ripponden.

ILKESTON: *Electric Light Cut Off.*—There has been some trouble in Ilkeston with the lessees of the Coliseum, and the Corporation on Thursday cut off the supply of electricity for the reason that the bill was unpaid. The owner of the premises subsequently arranged matters, and the performances were continued on Friday.

INDIA: *New Electric Power Scheme.*—The Bombay correspondent of *The Times* states that an Indian company is being formed for the generation of electricity by water storage at Lanauli, in the Western Ghats, for transmission to mills and factories at Bombay. The company is to have a capital of 170 lakhs of rupees (£1,133,320), 70 per cent. of which has been already subscribed. The scheme is to furnish 30,000 horse-power, with a reserve of 10,000 and possibilities of expansion to 50,000. The issue is under the auspices of the Tata firm, the owners of the Tata Ironworks.

KEIGHLEY: *Trolley 'Bus.*—A recommendation of the Tramways Committee has been approved to the effect that further extension of the tramways should be deferred pending the receipt of further information regarding the trackless trolley system. The Committee hope to ask the Corporation to sanction an application to Parliament for powers to utilise trolley omnibuses. After some adverse discussion, the Tramways Committee at the last meeting of the Corporation were given sanction to inspect some existing installations on the Continent.

LLANDUDNO: *Light Railway Extension.*—The Light Railway Commissioners have granted an extension of the Llandudno light electric railway system to Colwyn. Objections to the confirmation of this Order by the Board of Trade should be sent to the Board by September 15th.

NEWARK: *Electricity Supply Wanted.*—The Council are endeavouring to boom Newark as an industrial centre, but recognise the drawback of an absence of electricity supply. The Council some ten years ago obtained a Provisional Order, but there was considerable opposition to a municipal electricity works, and subsequent negotiations for a company to take over the Order fell through.

RAMSBOTTOM: *Electric Supply.*—The Lancashire Electric Power Co. have now completed their transformer station at Ramsbottom. Low-tension mains have been laid through the principal streets, and several local business firms are availing themselves of the supply.

RUSSIA: *Electric Tramways.*—The construction of electric tramways has been commenced in Odessa. The concession is held by the Société Anonyme des Tramways d'Odessa. The proposal of the Belgian company in Kharkoff to change its present horse trams to electric traction was refused. Unless some agreement is come to, says a British Consular report, the main streets will be served by very poor horse trams during the eleven years which remain of the Belgian concession. The municipality, however, is building some electric tramways. The first municipal cars came from Germany, the new ones are, however, of Russian make, the motors being fitted by the Russian Westinghouse Co. and a German firm.

SOUTH AFRICA: *Benoni Electric Supply.*—The work of erecting a substation in connection with a bulk supply has been commenced. Originally power was to have been taken from the New Kleinfontein Co., but a misunderstanding has arisen between them and the Council. Should this arrangement fall through, power will, in all probability, be taken from the Victoria Falls Power Co.

STEVENAGE: *Electric Supply.*—It is stated that the Council have transferred their electric lighting Provisional Order to a Manchester firm.

SWEDEN: *The Trolley 'Bus.*—The Stockholm municipality has granted a concession to a local company to instal the trackless trolley system there.

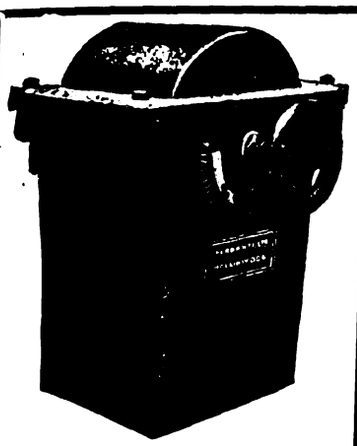
TORQUAY: *Tramway Dispute.*—The *Western Morning News* states that an application has been made by the Torquay Tramways Company to the Board of Trade to appoint an arbitrator to settle the differences which have arisen between the company and the Corporation with reference to the system of electrical traction on the Torbay-road, the Corporation having refused their consent to the company's proposal to convert the present Dolter surface-contact system to the overhead trolley system. The Board of Trade have appointed Mr. Archibald Reed, barrister-at-law, to conduct the arbitration, which will take place in London on September 12th.

WIGAN: *Condition of Tramways.*—The Tramways Committee have decided that certain of the recommendations made by Mr. C. W. Mallins, the Liverpool Tramways Manager, regarding the Wigan tramway undertaking, shall be acted upon. We summarised Mr. Mallins' report in our issue for August 18th, p. 541. Certain new loops and additional passing-places are to be constructed, and six new double-deck, single track, top-covered cars are to be purchased for the Standish route. These latter cars will be smaller than those now in use.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

ADWICK-LE-STREET.—A Local Government Board inquiry has been held into an application by the Doncaster Rural District Council for a loan in connection with a scheme of main sewerage, in which electrically driven centrifugal pumps will be used. Consulting Engineers, Messrs. D. Balfour & Son, 3 St. Nicholas Buildings, Newcastle-on-Tyne.



ALDERSHOT.—The Council require a chain grate mechanical stoker. Particulars from the electrical engineer.

BLACKPOOL.—Bispham Council have decided to apply for a loan of £9,855 for electric lighting purposes.

BURY ST. EDMUNDS.—An enquiry was held last week concerning a loan of £1,463 for extensions to the municipal electricity undertaking. Of this sum £943 are for an engine, £55 for switchgear, £75 pipework, £330 mains, and £15 provisional sums for additions. A new 200 kw. set is being installed.

CALCUTTA.—The Calcutta Electricity Supply Corporation require motor generators, and turbo-alternators and condens-

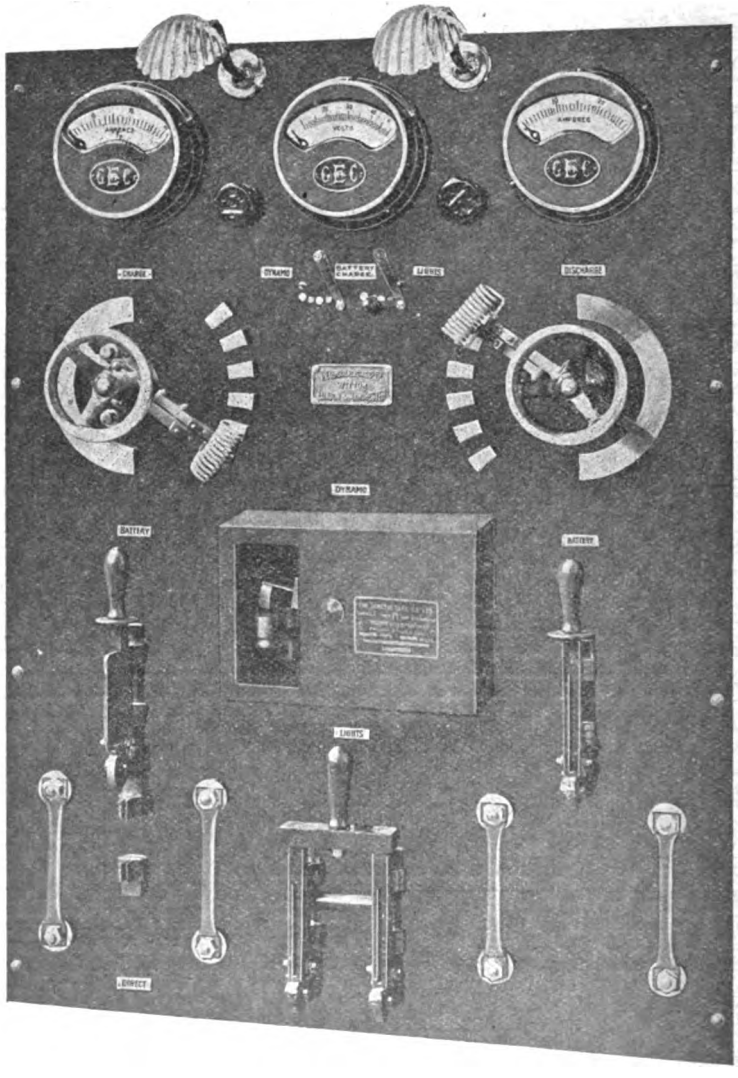
G.E.C. SWITCHBOARDS

Made throughout at Witton Works, near Birmingham.

Generating Panels
Lighting Feeder Panels
Power Panels
Battery Booster and Booster Motor Panels
Three-wire Balancer Panels
Load Panels
Motor Panels
Dynamo and Distributing Panels
Main Distributing Panels
Charging Panels
Accumulator Panels
Traction Feeder Pillar Panels
Synchroniser Panels,
Etc., Etc., Etc.

All Instruments and Switchgear used are of well-known G.E.C. manufacture, and mounted on best quality enamelled slate, by the most skilled workmen.



REGD TRADE MARK

THE GENERAL ELECTRIC Co., Ltd.,

Head Office: 67, Queen Victoria Street, LONDON, E.C.

Branches: Manchester, Birmingham, Glasgow, Cardiff, Newcastle-on-Tyne, Belfast, Dublin.

Works: BIRMINGHAM, Witton, MANCHESTER, LONDON.

STANDARD ACCUMULATOR PANEL.

ing plant. Particulars from the Secretary, Salisbury House, London Wall, London, E.C.

CANADA.—The Seaforth (Ontario) municipality are to take electrical energy from the Hydro-Electric Commission, and will spend £5,000 on the necessary sub-station plant.

GRAVESEND.—A loan of £11,000 is to be applied for, for additional generating plant, mains, feeders, and distributors.

HALIFAX.—The Electricity Committee propose to spend £10,000 upon new generating plant.

JUTLAND.—A British Consular report states that an electric railway is being planned between Aarhus and Randers, in conjunction with a general supply of electricity. Another scheme proposes the construction of an electric power station at Marlbo.

LITTLEBOROUGH.—The local District Council have decided to advertise for a loan of £2,800 on the electricity account. Sanction has been obtained from the Local Government Board.

PETERBOROUGH.—An enquiry was held last week concerning a loan of £2,100 for mains extensions. There was considerable opposition, it being contended that the undertaking could never be made profitable, and that the loss to date on it was £7,547. The proposed extensions are in order to meet numerous applications for power supply.

RUSSIA.—The *Anglo-Russian Gazette* states that State-Councillor Chatelaine, of the St. Petersburg Polytechnic Institute, is proceeding to America, on behalf of the Minister of Commerce, to investigate water-power electrical installations. The aim is to develop the immense water power within the empire for the generation of electricity. Our contemporary holds out the prospect that Russia will be purchasing a vast quantity of electrical machinery in the near future.

TODMORDEN.—An inquiry was held on Friday into a loan of £300 for lighting the Town Hall by electricity.

MISCELLANEOUS

AUSTRALIA.—Tenders are invited by the Deputy Postmaster-General, Hobart, by October 17th, for telephone cable, instruments, switchboards, battery material, wire, insulators, ironwork, &c. Local representation is necessary. Copies of specifications may be seen at 72 Victoria Street or 73 Basinghall Street, London.

BRADFORD.—A sub-committee of the Tramways Committee has been formed to put into effect the Corporation's power to run trolley omnibuses.

MOUNTAIN ASH.—The Council require electrical stores. Particulars from the electrical engineer.

NEWCASTLE.—The Tramways Committee recommend that the tramways be extended to Shieldfield, by way of Clarence Street, on to Jesmond Road, and to Armstrong Bridge. From the bridge the lines will be extended down the bank and on to Heaton Cemetery; from the last-named place on to Chillingham Road and Shields Road. It has also been decided to recommend that a trackless trolley service be arranged between Scotswood and Newburn, and also to Blaydon.

WIGAN.—Six new double-deck, top-covered tramcars are required, and some additional track work is to be carried out.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. The sums in brackets indicate, not the estimated value of the electric light installation, but the estimated cost of the whole building.

LONDON.—Electric Theatre, Stockwell. British Bijou Cinematograph Theatres, Ltd., 17 Coleman Street, E.C.

Discharge block and staff quarters, Eastern Fever Hospital, Homerton. W. T. Hatch, Metropolitan Asylums Board, Thames Embankment, E.C.

PROVINCES.

ABERDEEN.—Roman Catholic Church. Bishop Chisholme.

BANBURY.—Premises for Banbury Co-operative Industrial Society. Architect, F. J. Cooke, 33 Bridge Street, Banbury

BARRHEAD.—Masonic hall. Lennox and McMath, architects, 103 Bath Street, Glasgow.

BASINGSTOKE.—New County Asylum at Park Brewett Farm. Hants County Council.

BOLTON.—Six shops, offices and warehouses, Bradshawgate (£9,000). T. E. Smith, architect, Central Chambers, Bolton.

BRAY.—Pavilion. Amusements Committee.

BROUGHTY FERRY.—New School. Education Committee.

BURY.—Enlargement of Post Office. H.M. Office of Works

CLEETHORPES.—Proposed tea-room, bandstand and conveniences, Kingsway. Surveyor, Cleethorpes Council.

CLITHEROE.—Secondary School. Education Committee.

CREWE.—Lyceum Theatre, Heath Street. Mr. Yoxall, builder, Stoke.

DARLASTON.—New Schools. Education Committee.

DARWEN.—School at Spring Bank. Mr. R. W. Smith-Saville, Borough Engineer.

DENNISTOWN (GLASGOW).—School. Architects, Watson and Salmond, 225 St. Vincent Street.

DUBLIN.—Nurses' Home, St. Vincent Hospital. Architects, W. H. Byrne and Son, 20 Suffolk Street, Dublin.

DUNDEE.—Observatory. T. M. Cappon, architect, 32 Bank Street, Dundee.

DUNFERMLINE.—Extensions and alterations at Townhill schools. School Board.

DURHAM.—Theatre and concert hall. Architects, Gibson and Steinlet, Camden Street, North Shields.

EDINBURGH.—Extensions to warehouse for Lamb, Reid and Drummond. Architect, R. F. Shearer, 143 George Street, Edinburgh.

Additions to Henderson and Sons' biscuit factory. R. R. Hagg, 96 Mayfield Street, Edinburgh.

GLASGOW.—Additions to Royal Gartnawl Asylum (£2,000). J. Burnet and Son, architects, 209 St. Vincent Street, Glasgow.

Extensions to Victoria Infirmary, Langside. H. E. Clifford, architect, 225 St. Vincent Street, Glasgow.

School, Kingarth Street (£20,367). Thomson and Sandilands, architects, 4 Jane Street, Glasgow.

Warehouse and offices. Killearn Street and Saracen Street, Architects, Wyle & Blake, 219 St. Vincent Street.

GOVAN.—Extensions to works of Thermotank Ventilating Co., Ltd. Office, 55, West Regent Street, Glasgow.

GRIMSBY.—Extension Public Library. Borough Engineer.

GREENOCK.—Extensions to library. Public Library Committee.

HALIFAX.—St. Paul's Church. Jackson and Fox, architects, 7 Rawson Street, Halifax.

HASTINGS.—Rebuilding Hastings, St. Leonards, and East Sussex Hospital.

HULL.—Isolation Hospital at Patrington. Clerk, Rural District Council.

HYDE.—New police buildings and municipal offices.

ILFORD.—Four houses, Holcombe Road. C. M. Crickmer, 1, Lincoln's Inn Fields, W.C.

Ten houses, Perth Road. B. Bailey & Co.

Ten houses, 176-94, Coventry Road. F. E. Clark, 133, Shelbourne Road, Tottenham.

LANCASTER.—New Post Office. H.M. Office of Works.

LLANDUDNO.—New police station. Carnarvonshire Joint Police Committee.

LINCOLN.—Public Library on Greyfriars. Borough Surveyor.

Elementary school at Legsby. Architects, Scorer & Gamble, Bank Street Chambers.

MAIDSTONE.—Cinematograph theatre for the Maidstone Electric Theatre Co.

MANCHESTER.—Elysian Street and Ravensbury Street Schools. Education Department.

MARGATE.—Open-air concert hall near Fort. Town Clerk.

MORECAMBE.—Art and Technical School. County Architect, 16 Ribblesdale Place, Preston.

MOSSLEY.—New school. Education Committee.

NELSON.—Church, Burnley Road.

NEWMARKET.—Fire station, pumping station, and depôt. Town Clerk.

OXFORD.—Council buildings. County Surveyor.

POOLE.—Elementary School, South Road. Borough Surveyor.

PORTOBELLO.—Church. Architect, G. Mackie.

PRESTON.—Boys' Grammar School. Education Offices.

ST. HELENS.—Boys' Secondary School, Cowley Hill Lane. Education Committee.

SUNDERLAND.—College, Durham Road. Education Committee.

TORQUAY.—New central fire station. Town Clerk.

WALLSEND.—Fire station; also public baths. Town Clerk.

WATFORD.—Grammar School. Russell and Cooper, architects, 11 Gray's Inn Square, W.C.

WEST HAM.—Gainsborough Road School. Architect, W. Jacques, 2 Fen Court, Fenchurch Street, E.C.

WISHAW (LANARK).—School. Steel and King, architects, Wishaw.

WOLVERHAMPTON.—Secondary School for Girls. Town Clerk.

TENDERS RECEIVED AND ACCEPTED

BELFAST.—An order has been placed by the Corporation with the Worthington Pump Co. for a surface condensing plant at £400.

BOLTON.—The Electricity Committee have accepted the tender of Messrs. Newton, Chambers & Co. for a feed water tank.

DUNDEE.—The tender of a local firm, Messrs. T. C. Keay, has been accepted at £323 for five hundred electric lamps for stair lighting.

FLEETWOOD.—The Congregational Church is to be lighted with electricity, and Mr. R. Barron, of Albert Street, has been entrusted with the work.

LONDON: *Battersea*.—An order for a new feeder switchboard has been placed with Messrs. Pooley & Austin, 25 Victoria Street, London.

Digitized by Google

Deptford.—Messrs. C. A. Parsons & Co. are supplying two 5,000-kw. turbo-generators with Brown-Boveri-Parsons generators to the London Electric Supply Corporation. This further extension of the station will be necessary to supply the London, Brighton & South Coast Railway when the electrical equipment of the Crystal Palace line is completed.

MORECAMBE.—The following tenders have been accepted :—Feeder pillars, Messrs. Boydell & Sons; arc lamp carbons, Messrs. G. Hill & Co.

SOUTH AFRICA.—The tender of the Western Electric Co., Ltd., for about a mile and a half of high-tension cable at £142 10s., has been accepted.

WALTHAMSTOW.—The Council have accepted the following tenders in regard to six double-deck tramcars :—Hurst, Nelson & Co., Ltd. : car bodies (with spring fenders) £1,860, trucks £426; Brush Electrical Engineering Co., Ltd. : electrical equipments, £1,684. The tender of Bartlett & Sons, at £112, for a weighbridge at the electricity works has also been accepted.

The following tenders have been accepted during the past month by the Government Departments named :—War Office : Paper insulated cables, Western Electric Co., Ltd.; conductors and supports, British Insulated & Helsby Cables, Ltd.; electric motors, Electric Construction Co., Ltd., Siemens Bros.; internal wiring institution, Ewshott Camp, G. E. Taylor & Co. India Office, Store Department : Accumulators, &c., Pritchetts & Gold; cables, British Insulated & Helsby Cables, Ltd.; dynamos, &c., Stone & Co.; fans, Veritys, Ltd.; motors, Lancashire Dynamo Co.; troughing, Dorman, Long & Co. General Post Office : House telephone apparatus, Gent & Co., Ltd.; india-rubber and cotton-core cable, British Insulated & Helsby Cables, Ltd., W. T. Henley's Telegraph Works Co., Ltd.; cable paper core, Johnson & Phillips, Ltd., Callender's Cable & Construction Co.; submarine cables, India Rubber, Gutta Percha, &c., Works, Ltd.; supply of and laying cable, also dry cells, Siemens Bros. & Co., Ltd.; insulators, Bullers, Ltd., Bourne & Son.

APPOINTMENTS AND PERSONAL NOTES

An electrical engineering apprentice is required. (See an advertisement on another page.)

A first-class salesman is required by a large electrical manufacturing firm in the Manchester district. (See an advertisement on another page.)

An assistant is required in sales department of wholesale electrical firm, Manchester district. (See an advertisement on another page.)

Travellers and salesmen required for wholesale electrical supplies in Lancashire and Yorkshire district. (See an advertisement on another page.)

The Textile Institute Journal.—The first issue of this publication is to hand. It is the official journal of the Textile Institute, which was inaugurated in Manchester in April of this year for the purposes of promoting the application of scientific methods in the textile industry.

"Osrams" in a Synagogue.—The *Jewish World* states that an installation of electric light has recently been added to the Bradford Synagogue, consisting of three six-light electroliers, carrying 50-candle power "Osrams" in the body of the synagogue and two seven-light "Osram" candle fittings on the menoroth, on the two sides of the Holy Ark, besides lamps in the organ loft, and the two schoolrooms. They were lit for the first time on Shevuoth, and proved a great success. The whole of the expense was defrayed by Mrs. von. Halle, in memory of her husband, who died last winter.

Long Distance Telephony.—The *Elektrotechnische Zeitschrift* states that a telephone service will shortly be inaugurated between some of the chief cities of France and Spain. In the latter country, the line will pass through Irun, San Sebastian, Tolosa, and Pamplona, and will connect with the towns of Madrid, Barcelona, Reus, Lerida, Igualda, and Tarragona. The route in France is not yet published. The fee for a three-minutes conversation will vary from 1·5 to 8 francs, according to the place. A conversation between Paris and Madrid will cost 6 francs.

OSRAM·LAMPS

CATALOGUES AND PAMPHLETS, &c., RECEIVED

TELEPHONES AND ELECTRIC BELLS.—In the Sterling Telephone & Electric Co.'s new catalogue (200 Upper Thames Street, E.C.) we find the interesting statement that, with a few unimportant exceptions, all the telephones, bells, &c., sold by the firm are made at their new works in Dagenham, Essex. The excellent finish of the "Sterling" instruments has been known for so long that many customers who have hitherto refrained from placing orders for foreign-made instruments will welcome this announcement. Besides the domestic and exchange sets and bells, a number of strong and watertight types are listed, including a special telephone for mines, and bells, both of the totally enclosed "Thruster" and other waterproof patterns. A speciality of the company has always been their intercommunication instruments, and new features are introduced in their "Secret" and "Double Line," and common battery systems. The arrangement of the catalogue is good, but a 76-page book such as this should have an index.

TELEPHONE APPARATUS AND SUPPLIES.—The Western Electric Co., Ltd. (Norfolk House, Victoria Embankment, E.C.) have issued a new catalogue and price list. It deals not only with exchange equipments and apparatus, with which the firm is particularly identified, but also almost every class of telephone instrument. Sets for house installations range from a 7s. 6d. hand set for connecting directly to bell circuits up to the highest class domestic instruments, inter-communication sets, and small exchanges. Instructions for connecting up, and other information concerning the instruments is included. Some solid-looking mining telephones are listed, and the section on tools and "telephone supplies" covers a wide range from lead sleeves to motor bicycles. The book is well illustrated, particularly the parts relating to exchange equipment, which include pictures of practically every piece of detail apparatus. The only thing we have to criticise is a rather amateurish cable code. We can fancy the consternation at the W. E. Co.'s office on the receipt of a telegram, "Cord, Contact, and Pingres all useless. Replace and send another Blundering Monster and Certify," although this only means : "4 in. diagonal-cutting pliers, 7½ in. and 5½ in. parallel pliers all useless. Replace and send another Haven's Clamp for No. 8 B & S. wire, a 1 in. socket-framing chisel, and a short Fletcher wall bracket."

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

METAL FILAMENT LAMPS.—A leaflet from the Electrical Co., Ltd. (122 Charing Cross Road, London, W.C.), gives revised lists of standard sizes and prices of "Aegma" metal filament lamps. High candle-power lamps for street and shop lighting and candle lamps are included.

SMALL MOTORS AND MOTOR-GENERATORS.—The Crypto Electrical Co. (155 Bermondsey Street, London, S.E.) have sent us a list of their single-, two- and three-phase motors of from ¼ to 20 h.p. These can be obtained with short-circuited or wound rotors, and are listed for a variety of frequencies. Another leaflet describes the firm's small combined motor-generator. This has an output on the secondary side of from 350 to 400 watts.

SWITCHGEAR FOR MINES.—Messrs. A. Reyrolle & Co., Ltd. (Hebburn-on-Tyne), call our attention to the fact that they are manufacturing a new design of mining panel in large quantities. The interlocking arrangements are such that an isolating switch cannot be opened until the corresponding oil-switch is in the "off" position, and also the oil-switch cannot be closed while the isolating switch is open. Each door is interlocked, so that it cannot be opened until the whole panel has been made "dead" by opening the isolating switch. The panels can be designed to accommodate current and potential transformers and instruments if desired. Where flame and explosion-proof gear is required, the enclosure of the various parts in stronger cast-iron boxes with wide machined joints is recommended, as this has been found to be an effective protection against the emission of flame.

Robertson and Osram Sports.—The employees of the General Electric Co.'s Robertson and Osram Lamp Works held their annual sports at Shepherd's Bush, London, on Saturday last. A series of tugs-of-war with Osram, Robertson's, and G.E.C. teams was won by Robertson's. The winner of the men's one mile championship was Mr. L. Hipwell. Mrs. C. Wilson presented the prizes.

Strike at Dick, Kerr's Works.—In connection with the patterns for the Bergmann steam turbine, the manufacture of which Messrs. Dick, Kerr & Co. have in hand at their Preston works, some 70 additional pattern makers were employed, it having been decided to make all the standard patterns without delay. Taking advantage of the rush, the men so employed struck for an additional two shillings per week. The firm refused to accede to the demand, and the men's notices have expired. About 90 men are concerned in the strike.

COMPANIES' MEETINGS REPORTS, &c.

DUBLIN & LUCAN ELECTRIC RAILWAY CO.—The report and accounts for the June half-year, which were adopted at the half-yearly meeting on Thursday, show a balance of £612, after meeting the preference dividend. The balance is carried forward.

ABERDEEN SUBURBAN TRAMWAYS CO.—There was a profit of £1,260 for the June half-year, making an amount of £2,531 available for distribution. The sum of £1,200 is added to renewal and depreciation account, and a dividend of 2½ per cent. declared, carrying forward £508. An amicable arrangement has at last been come to with the Aberdeen Corporation for the supply of energy, the price agreed being 1·75d. per unit.

MEXICO TRAMWAYS CO.—The general prosperity of the company was commented upon at the annual meeting recently held in Toronto. The chairman said that Mexico had almost entirely recovered from the late dulness.

MEXICAN LIGHT & POWER CO.—At the annual meeting recently held in Toronto it was stated that the water storage capacity for running the power stations had been increased to 20,000,000 cubic metres. Dividends of 7 per cent. on the preference stock and 4 per cent. on the ordinary stock have been declared.

NAIROBI ELECTRIC POWER & LIGHTING CO.—The report for 1909 shows that the number of consumers increased from 178 to 228, and the equivalent of 8-c.p. lamps connected from 3,628 to 4,728. The h.p. of motors increased from 64 to 80.

BLACKPOOL & FLEETWOOD TRAMROAD CO.—The accounts for the June half-year show a balance of £5,228. A 4 per cent. dividend is paid on the ordinary shares, £750 placed to depreciation, £500 to reserve, and £1,028 carried forward.

MERSEY RAILWAY CO.—Mr. James Falconar presided at the half-yearly meeting on Friday. We summarised the accounts on p. 543 of our issue for August 18th. The passenger traffic has increased by 120 per cent. since the last half-year of steam working, and the receipts by 85 per cent. The Act of Parliament which the company secured last session enables the debit to revenue account to be placed to capital. This now amounts to £11,821, and after January 1st next, the net revenue will be available for dividends on the debenture stocks.

SOCIETE ANONYME WESTINGHOUSE.—£4,443 carried forward after provision for reserve.

YORKSHIRE ELECTRIC POWER CO.—Net profit of £2,612 for June half-year, after meeting mortgage interest. It is proposed to issue a further £100,000 six per cent. preference shares.

ASCOT GAS & ELECTRICITY CO.—Interim dividend at the rate of 5 per cent. per annum, less tax.

OXFORD ELECTRIC CO.—Interim dividend at the rate of 6 per cent. per annum, les tax.

BRITISH INSULATED & HELSBY CABLES, LTD.—The transfer books will be closed from September 5th to 12th inclusive.

NEW COMPANIES

S. C. G. DEVELOPMENT CO.—Registered by Slaughter & May, 18 Austin Friars, London. Capital, £5,000. Railway and tramway constructors, contractors for public works, &c.

SIRENO CO., 46 Brewer Street, London. Capital, £3,000. Manufacturers of electric warning signals, motor horns, projectors, switches, &c.

CARTMAN & CO.—Registered by Jordan & Sons, 116 Chancery Lane, London. Capital, £5,000. To take over the electric piano and musical instrument business carried on at Manchester as the "Tel Electric Co."

TAYLOR & ROMANY, 35 Little Pulteney Street, St. James's, London. Capital, £2,000. To acquire the business of furnishing ironmongers, electrical and mechanical engineers, &c., now carried on at the above address.

W. L. COOPER.—Registered by Shaw & Sons, Fetter Lane, London. Capital, £1,000. To take over the existing business of electric and general engineers, &c.

CHILIAN CONSTRUCTION CO.—Registered by Linklater & Co., 2, Bond Court, Walbrook, London, E.C. Capital, £500,000. Financiers and constructors of railways, tramways, electrical undertakings, &c.

CHILIAN NORTHERN RAILWAY CO.—Capital, £500.000. To work a concession granted by the Government of Chili for the construction and operation of a railway from Pueblo to Lagunas, and to construct railways, tramways, electric light and power works, &c.

T. & J. JACKSON, 14 Park Road, Regent's Park, London. Capital, £11.000 (5.000 preference, 5.000 ordinary, and 1,000 deferred). Electrical and mechanical engineers.

The Encyclopædia Britannica.—The University of Cambridge has taken over from the *Times* the control and copyright of the Encyclopædia Britannica, and will publish an entirely new and complete (eleventh) edition about the end of this year. This has been in preparation for eight years, and will comprise 28 quarto volumes, of which the last will be an index.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 5s. to £58 15s. per ton (last week, £58 to £58 10s.).

METAL FILAMENT LAMP PATENTS.—The Brush Electrical Engineering Co., Ltd., write us regarding recent announcements that legal proceedings have been commenced by the proprietors of certain metal filament lamp patents, and draw the attention of their customers to the fact that as their "Metallum" lamps are manufactured under the Colloid-Tungsten master patents, they do not incur any liability. In any event, the Brush Co. will indemnify one and all against any possible legal proceedings.

CHANGE OF ADDRESS.—The British Electric Calibrated Fuse Co. have removed their works from Harpenden to Luton. The new telephone number is 278 Luton, and telegraphic address "Fuses, Luton."

AGENCIES.—Messrs. Balcke & Co. have appointed the following new agents:—Scotland: Messrs. Morris, Warden & Co., 68 Gordon Street, Glasgow. Birmingham District: Messrs. Frank R. Cerrito & Co., Exchange Buildings, Stephenson Place, Birmingham.

ELECTRICAL COOKERS.—The Berry Construction Co., Ltd., have appointed Messrs. Gillespie & Beales, of Amberley House, Norfolk Street, Strand, W.C., as sole wholesale agents. Messrs. Gillespie & Beales are now appointing local agents in the most go-ahead districts.

BANKRUPTCIES.—The public examination of J. Szek, patentee, 53 Chancery Lane, London, will be held on November 1st, at 11 a.m., at Bankruptcy Buildings, Carey Street, London.

The public examination of F. Peacock, electrician, 59 North Station Road, Colchester, will be held at 11.30 a.m., on September 9th, at the Law Courts, Colchester. The first meeting of creditors will be held on the same day at 11 a.m., at the Cups Hotel.

The trustee in the bankruptcy of S. Emerson Smith, electrical engineer, 271 High Street, Lincoln, has been released.

The trustee in the bankruptcy of W. C. Ellis, electrician, Applegate Street, Leicester, has been released.

A first and final dividend of 3s. in the £1 will be paid on September 6th at Messrs. Corfield & Cripwell, 12 Cherry Street, Birmingham, in the bankruptcy of H. J. Burdett, electrical engineer, 16 Regent Street, Rugby, and 32 Earl Street, Coventry.

LIQUIDATIONS.—A meeting of creditors of the Polesworth Electrical Appliances Co., Ltd., will be held at 36 Cannon Street, Birmingham, on September 6th, at 3 p.m.

NEW ANGLO-FRENCH TELEPHONE CABLE.—The tests of the telephone cable recently laid between England and France, in which Pupin loading coils were used, have proved thoroughly satisfactory. As we have already announced, the French Government will also lay a telephone cable across the English Channel, and now that the tests of the one recently laid by the British Post Office have shown such good results there is little doubt that the new cable will be of a similar character. We gave a detailed illustrated technical description of the British cable in our issue for March 17th, p. 179.

The Scottish Exhibition
OF
National History, Art, & Industry.
Glasgow, 1911.

MAY to OCTOBER.

Under the Patronage of
HIS MOST GRACIOUS MAJESTY THE KING.

A PROSPECTUS, giving FULL DETAILS of the objects and scope of the Exhibition has been prepared, and will be sent on application at the Offices, 190 WEST GEORGE ST., GLASGOW.

Outstanding Features:—
NATIONAL HISTORY, MODERN ART, INDUSTRY, ENTERTAINMENT.

SUMMARY

The Allgemeine Elektricitäts Gesellschaft has taken over the Lahmeyer works at Frankfort. The Felten & Guilleaumé Co., which will drop the name Lahmeyer from its title, will in future devote itself to cable and wire manufacture. (Page 572.)

Our monthly article on new electrical supplies and accessories includes illustrated descriptions of a light electric oven with an internal air circulation, and a heavy range after the pattern of gas cookers. Some new fittings include an arc lamp case adapted for use with a high candle-power metal-filament lamp, inverted metal-filament lamp fittings, an adjustable dining-room pendant, and strip reflectors. Among the other novelties described are a line of iron-clad switchgear, an enclosed arc lamp, a complete series of tungsten-filament lamps, and a wiring system. (Page 573.)

The Solicitor-General has just affirmed the decision of the Patent Office of July, 1907, to grant a patent to a German company in spite of strenuous opposition. The patent in question covers the heating of tungsten filaments to a temperature close upon the melting-point of tungsten previous to their use. (Page 576.)

The report of the Chief Engineer of the British Engine, Boiler & Electrical Insurance Co., Ltd., notifies an increase of 9·8 per cent. in the number of machines insured, and a satisfactory decrease of over 4 per cent. in the number of breakdowns amongst insured machines. The primary cause of the damage resulting in failure was unascertained in nearly half the number of breakdowns. Some interesting cases are described. (Page 577.)

An article on the present position with regard to the proposed municipal wiring bill, with some comment on the attitude taken by central station engineers with regard to house wiring, will be found on page 577.

In our notes on "The Wiring Contractors' Point of View," we deal with the new tariff of the Metropolitan Electric Supply Co., the relations between wiring contractors and central station engineers, and the amicable proceedings at Leicester which have followed the acceptance of the Corporation of the judgment against them. (Page 578.)

An amalgamation of interests has been effected between the Anglo-German Wireless Syndicate, Ltd., owners of the Lepel patents, and the Compagnie Générale Radiotelegraphie, the French company exploiting the Rochefort spark system. Mr. V. Poulsen has appealed against the decision of the Comptroller-General to grant a patent to Baron von Lepel for hi disc discharger. The stations to be erected for the Australian Government at Sydney and Fremantle are to be on the Telefunken system. (Page 578.)

In his Presidential Address to the Engineering Section of the British Association last week, Prof. Dalby, dealing with our railway system, pointed to the low percentage which locomotive expenses bear to the

Digitized by Google

whole cost of working. A comparison of working expenses on steam and electric lines showed the latter to be about two-thirds of the former per train-mile, although it was admitted that the two conditions are not strictly comparable. The possibility of extending the South London single-phase line to Brighton was mentioned. In a lecture before the Engineering Section on Monday, Mr. Philip Dawson described the South London single-phase railway. Figures were given of the life of the commutators, and acceleration. After eight months' working the trolley wires show no appreciable wear, in spite of the fact that the height of these in one or two places drops suddenly from over 20 ft. to less than 10 ft. Mr. E. W. Cowan dealt with electricity tariffs before the Economic Science and Statistics Section, and condemned the practice of attempting to fix the charge for every part of a supply according to the cost of production. A discussion on the neglect of science by industry and commerce in the Chemistry Section produced some conflicting views on the part of educational experts and engineers, one speaker expressing the opinion that the greatest ignorance of the value of science applied to industry was to be found in the electrical and chemical industries. Mr. H. E. Wimperis described, in the Engineering Section, an accelerometer for the measurement of road resistances, which he has applied in connection with acceleration and retardation on London electric railways. In the same section Prof. A. Schwartz described a machine for measuring the hysteresis of india-rubber, and in the Mathematical Section a method of obviating the use of platinum for leading-in wires of electric incandescent lamps was explained by Dr. Sands. (Page 579.)

A SHORT article relates to the competition between electricity and gas for street lighting. (Page 581.)

AMONG the specifications published by the Patent Office on Thursday last was one by V. Colin and M. Jeance for an oscillation generator for wireless telephony, in which the arc is struck between copper and carbon electrodes in a gas or liquid.—The Felten and Guilleaume-Lahmeyerwerke A.-G. protect the insertion of devices in lamp bulbs which will indicate how long the lamp has burned, and thus afford a check on complaints.—An appeal has been lodged against the decision to grant C. H. Weber a patent for a process of preventing the oxidation of tungsten powder.—On appeal, a patent has been granted to W. Schwarz for an exhaust steam accumulator in which the steam is brought into intimate contact with the water by breaking up the latter. (Page 582.)

A LETTER from Mr. Frank Broadbent contains further criticism of the rule that only corporate members of the Institution of Civil Engineers shall be admitted to the newly-formed Association of Consulting Engineers. (Page 583.)

THE Aberdeen Electrical Engineer recommends reducing the charge for heating from 1½d. to 1d. per unit. —A motion calling upon the Bexley Tramways Manager to resign has not been carried by the Council.—Sunderland Corporation are to institute a Sales Department on the lines of Marylebone and West Ham.—Coventry and Barrow Corporations contemplate purchasing the local Tramway Companies.—The question of gas *v.* electricity for street lighting is attracting much attention in Harrogate.—Overcrowding on the Plymouth tramways is being inquired into by the Board of Trade. (Page 584.)

Dartford Corporation propose to borrow £11,000, and the Potchefstroom (S.A.) Municipality £20,000. The Transvaal Gold Mining Estates, Ltd., require a large power plant, and transformers are required at Dublin. An electrical installation is to be erected at the Buenos Aires Customs House at a cost of £22,000. A loan of £22,268 is required at Stalybridge. (Page 585.)

ARRANGEMENTS FOR THE WEEK

SATURDAY, SEPTEMBER 10TH.

Mining Institute of Scotland.

9 a.m. Annual Excursion to Broxburn. Inspection of electrical installation at Broxburn Oil Works.

TUESDAY, SEPTEMBER 13TH.

National Electrical Manufacturers' Association.

2.30 p.m. Committee meeting at Balfour House, Finsbury Pavement, London.

WEDNESDAY, SEPTEMBER 14TH.

Institution of Mining Engineers.

11 a.m. Annual general meeting at University College, Nottingham. Among the Papers to be read is "Progress in the Use of Exhaust-Steam Power," by J. Burns.

Institute of Metals.

Meeting at the Engineering and Machinery Exhibition at Olympia.

SATURDAY, SEPTEMBER 17TH.

Institute of Marine Engineers.

Meeting at Engineering and Machinery Exhibition, Olympia.

AMALGAMATION OF THE A.E.G. AND THE LAHMEYER COMPANIES

AN official communication issued by the Allgemeine Elektricitäts-Gesellschaft announces that the Felten & Guilleaume Lahmeyerwerke A.-G. has disposed of the electrical machinery works at Frankfort-on-Main to the A.E.G. in return for an issue of A.E.G. shares. The works will be made over to the A.E.G. in the form of a company with a share capital of £500,000, and reserves of £150,000, which will take over the buildings and plant. The Felten & Guilleaume Co. (which will drop the name of Lahmeyer from its title) will devote itself exclusively to cable and wire manufacture, as before the amalgamation with the Lahmeyer Co.

The A.E.G. has only consented to take over the works under the provision that shares to the value of 32 million marks (£1,600,000) of the Felten & Guilleaume Co. (out of the total of 55 million marks) are made over to it, and the Bank für elektrische Unternehmungen, Zürich, conjointly. As stated in our notice of the exchange of shares between the Elektricitäts-A.-G. and the Zürich Bank (ELECTRICAL ENGINEERING, August 11th, 1910, p. 523), the A.E.G. holds the controlling interests in this Bank, so that the A.E.G. will in future also have the controlling influence over the Felten & Guilleaume Co. itself, and its cable manufacture at the Mülheim Works.

A general meeting of the A.E.G. company will be called on October 15th, and an increase of the capital by 30 million marks, to bring it up to 150 million marks (£6,500,000), will be proposed. The new shares will be applied as follows:—One-third to the purchase of the Frankfort works, and the remaining to the acquisition of 16 million marks of shares of the Felten & Guilleaume Co., which, with the 16 million marks recently acquired by the Zürich Bank, make up the total of 32 million marks controlled by the A.E.G. At the meeting of the Felten & Guilleaume Co. on the same day, the conversion of the Frankfort works into an independent company, and the transfer of its shares to the A.E.G., will be proposed, as well as the change of name of the Mülheim undertaking to the Felten & Guilleaume Carlswerk A.-G.

At present it is premature to forecast the alterations that will be made in the corresponding companies in this country. A few weeks ago, Mr. R. R. Todd, who has hitherto managed the Lahmeyer Electrical Co.'s cable department, made arrangements with the firm that he would start business on his own account, retaining the agency for Felten & Guilleaume cables, and possibly taking up other agencies. No arrangements have yet been made with regard to the working of the A.E.G. Electric Co., the Lahmeyer Electrical Co., and the Electrical Co. under the new conditions.

Bonus System at Aberdeen.—Mr. J. A. Bell, City Electrical Engineer at Aberdeen, has reported to his committee in favour of instituting a bonus system for the electricity works staff. He regards such a system as having an important bearing upon reducing the works costs.

NEW ELECTRICAL SUPPLIES AND ACCESSORIES

Electric Cooking.

The illustration below shows a new pattern of electric oven which is being introduced by Bertram Thomas (Worsley Street, Hulme, Manchester). An important feature of the oven is a special interior construction inducing a true circulation of air, which ensures a uniform heating of the contents and results in a higher economy. The resistance wire heating elements are fixed under a horizontal metal sheet, which is extended up the back of the oven to within a few inches of the top. The narrow passage between this vertical sheet and the back of the oven induces a continuous circulation of the air, which passes down over the contents of the oven, and returns to the heating elements through apertures in the front of the horizontal metal sheet. This circulation of the air prevents the lower portion of the oven from getting unduly

Gray's Patent Oven.
(Bertram Thomas.)

hot, and ensures a thorough and uniform heating of the whole oven. Other novel features are a small incandescent lamp inside and a window, the provision of which renders it unnecessary to open the door of the oven until cooking is completed. A thermometer shows the interior temperature, which can be regulated to suit the particular class of food being cooked. Double walls of sheet metal, with fibrous insulators, are provided, to reduce the loss of heat by radiation. We have been supplied with the following particulars as to working and cost. Tests made in a customer's house on an oven measuring 17 ins. by 18 ins., by 19½ ins. inside, and taking 10 amperes at 230 volts, showed that the temperature was raised from cold to 350° Fahr. in 25 minutes. For meat, the temperature should be from 360° to 370° Fahr., while the highest temperature necessary is not more than 375° Fahr. The usual procedure is to heat the oven up with 2000 watts for half an hour, when the temperature will be some 360° Fahr. The food is then placed in the oven, and the heating units placed in series by switching over the double-pole throw-over switch. The oven then consumes some 500 watts, which is usually sufficient to maintain the required cooking temperature. Thus at 1d. per unit, the heating up costs 1d. and the cooking ½d. per hour. We understand that the oven retains its heat so well that after the current has been switched off altogether, pies, cakes and bread, &c., could be cooked without supplying further heat. The oven on which the above test was made is installed in a pantry adjoining living rooms, in a position where it would have been quite impossible to install a gas oven. One of these ovens can be seen in daily operation in the electric kitchen of Oetzmann & Co.'s "week-end cottage" in the grounds of the Japan-British Exhibition, London. It is exhibited there together with a patented distributing board for domestic apparatus. The board can be fastened on a dresser or table, and contains all the switches and plugs. The flexible wires to the various apparatus are kept taut by a system of pulleys and counterweights behind the board.

The General Electric Co., Ltd. (71 Queen Victoria Street, London), have brought out a new pattern of heavy cast-iron cooking range, in the design of which the company have had the co-operation of Mr. Holmes, of the Marylebone Electricity Supply sales department. As shown in our illustration, it is similar to a gas cooker in appearance, and is of equally substantial construction, being built almost entirely of cast iron and weighing some 5 cwt. It is 36 in. in height by 21 in. wide by 20 in. deep. The oven has an inside measurement of 20 in. by 16 in. by 15 in. A heavy lagging is provided, and the interior sheet-metal lining is enamelled to facilitate cleaning. For the same purpose, the side supports of the shelves and the shelves themselves are removeable. The bars or rods of the latter run from back to front in order that dishes may not catch in them and tilt up. There are two heating elements of the Archer pattern, one on each side. Each consists of a helix of spiral resistance wire fixed to china supports on a Stellite plate. This is protected inside by a sheet of perforated metal, and is attached to the heavily lagged round cast-iron plate seen in the illustration. The whole can be easily removed and the element repaired or replaced in a few minutes. The connections are arranged so that parts or all of both elements are on at the same time, and the two switches provide three heats, corresponding to 800, 1,600, and 2,400 watts respectively. Although the wires run at a bright red heat, they do not readily oxidise, and are stated to have a very long life. The top plate contains a 1,000-watt grill, consisting of a rectangular heating element mounted face downwards, so that the heat is thrown down direct on to the meat or toast on the grill. At the back are two hot plates, consuming 800 and 1,000 watts respectively. In these the heating element consists of resistance wire wound zig-zag, and embedded in an enamel coating on the underside of the plate. Lagging is provided under the heating element in these, and above in the case of the grill. Food can be kept hot or plates warmed in the space between the top plate and the oven. The switches are of the Hart rotary quick break pattern. Though the total capacity of the range is some 6 kw., the maximum demand

Cooking Range.
(General Electric Co.)

is said to be not often more than 2·5 kw. Ordinary kitchen utensils can be employed, but a special set of light saucepans, kettles, steamers, etc., is supplied at a low cost in tin or copper. We understand that the General Electric Co. have already sold between 40 and 50 of these ranges. The Marylebone Electricity Supply Department has purchased 24, and lets them out on hire to consumers at 7s. 6d. per quarter in order to encourage electric cooking. The company will shortly introduce a modified pattern with the switches and an indicating lamp on a separate board.

C

Digitized by Google

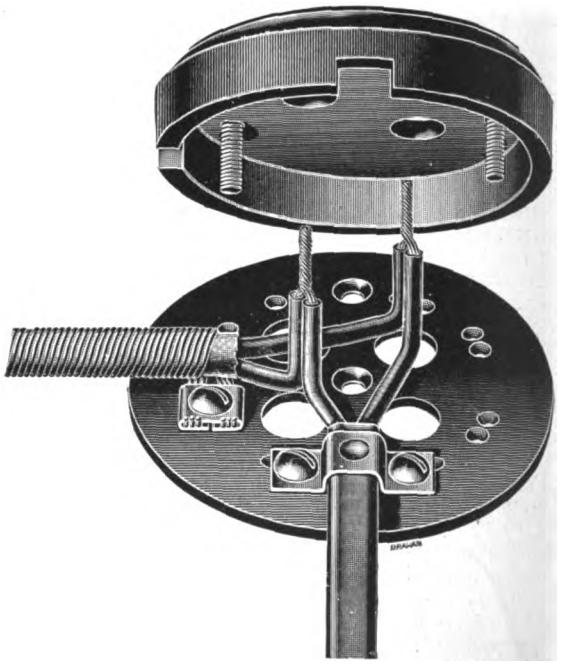
Lamps, Fittings, Switches, and Accessories.

The WARDLE ENGINEERING CO., LTD. (196 Deangate, Manchester) are developing several new designs of fittings, in addition to their now familiar "Streetlite." The "Beatark" fitting (see opposite page) is designed for cases in which wide diffusion of light is required, rather than concentrated deflection. It consists of a curved reflector of polished aluminium heavily lacquered, or of white enamelled metal, covered by a spun zinc top. Provision for the lampholder is made inside the fitting, so that only the lamp projects. This fitting is supplied in diameters of 12 ins. upwards for single lamps, or in diameters from 18 ins. upwards for groups of five or seven lamps; the larger type has been designed with the assistance of Mr. Cameron Gibson, the electrical engineer of Nuneaton, and the fitting also meets the present tendency to eliminate globes. A pattern of the "Streetlite" is also now made with a spun metal reflector instead of a globe. Another illustration shows a "converted" arc lamp. We also illustrate two internal fittings made by the same company. The "Deflectorlite" is a form of cluster fitting which will frequently be found convenient, either as a ceiling fitting or suspended by tubing or a chain in warehouses, docks, &c. The size illustrated can take up to twelve 50-c.p. lamps. This fitting is of zinc or aluminium enamelled green on the top, and either white or polished and lacquered underneath. The "Drawlite" is an inverted fitting for drawing offices, &c., 24 ins. in diameter and of enamelled zinc. A lampholder at the bottom is intended for an independent lamp for use when the indirect lighting is not required, or for a plug adapter. A feature of all these fittings is their moderate price.

A new line of switches has been introduced by the GENERAL ELECTRIC CO., LTD. (71 Queen Victoria Street, London), under the name of "Salford" Type Ironclad Switchgear. This gear is manufactured at Witton, and comprises two- and three-pole switches in iron boxes, with or without fuses. Special ammeters and voltmeters in cast iron cases can be attached direct to the switch-cases. The gear, either in its separate parts or combined, is made in three sizes, for 60, 100, and 200 amperes, the switches and switch fuses are supplied either two- or three-pole, the fuses are made single-pole only, and the switches and fuses are also made in 15, 30, and 60 ampere sizes. All the gear is suitable for 500-volt circuits, and the cases are watertight and fool-proof, the covers being interlocked with the switch. As can be seen from the illustrations, the gear has a substantial appearance. One of our illustrations shows a two-pole 100-ampere switch combined with fuses. These are of the porcelain expulsion type, and are boxed in with fire-resisting insulating partitions. Our top illustration is of a 50-ampere switch fuse with an ammeter attachment. Another illustration shows a convenient ironclad fuse-box, with carrier fuse, which is used where separate switches and fuses are preferred.

Among other novelties placed on the market by the General Electric Co. are various patterns of reflectors for small Osram lamps fitted with double-ended lamp holders, as shown in the illustrations. These are adapted for either series or parallel wiring. One of the fittings illustrated is a simple brass bracket for two 17-watt lamps, suitable for office desk lighting, and the other is a strip reflector for shop lighting.

JOHN DUGDILL & CO. (Failsworth, near Manchester) have introduced a new pattern of dining-room pendant with joints giving facilities for raising and lowering the fitting and moving it laterally in all directions. This enables the position of the lamps to be altered to suit the position of the dining table when extended or moved out of the normal position. As shown in the illustrations, the fitting has three Dugdill patent joints, by which it is held firmly in any position without either counterweights or springs. The position can be instantly altered in any direction, but the fitting is quite rigid, and retains the new position. Three lampholders are provided in the stock pattern, which is supplied ready wired. Its normal length is 3 ft. 6 in., but it extends a further 1 ft. 6 in. The finish is polished or bronzed brass, oxidised brass, oxidised copper or silver, or gilt, as required.



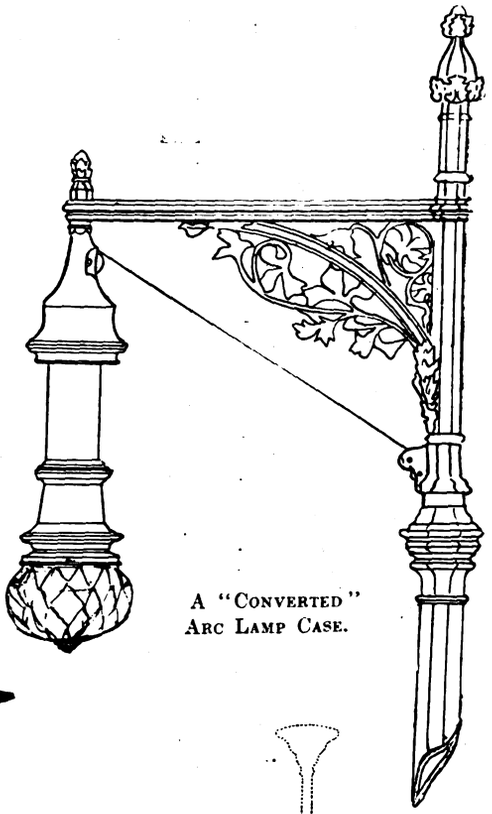
A complete list is now to hand of the Tungsten lamps made by the IMPERIAL LAMP WORKS (BRIMSDOWN), LTD. (Kingsway House, Kingsway, London, W.C.), at their works in Brimsdown, Middlesex. The filaments are produced by the colloidal process. The following are some of the standard sizes: 200—260 volts: 32 watts, 22·5 British candle-power; 40 watts, 28·5 c.p.; 55 watts, 45 c.p.; and 90 watts, 72 c.p. 100—135 volts: 17 watts, 14·5 c.p.; 25 watts, 22·5 c.p.; 32 watts, 28·5 c.p.; 55 watts, 45 c.p.; 80 watts, 67·5 c.p. 150-155 volts: 25 watts, 22·5 c.p.; 32 watts, 28·5 c.p.; 55 watts, 45 c.p. Other sizes for from 25 volts to 80 volts, and candle lamps for 25, 33, 50, 66—80, and 100—135 volts are listed. High candle-power lamps of 100 to 1,000 c.p. and special train-lighting lamps of 5 to 24 c.p. at 16, 22, and 24 volts are also listed.

Arc Lamps.

The BRITISH THOMSON-HOUSTON CO., LTD. (Rugby) have issued a leaflet describing a new improved pattern of enclosed lamp under the name of the "B.T.-H. Intensified Arc Lamp." This lamp embodies many novel features, including an entirely new mechanism permitting the use of carbons of small diameter. With such carbons the arc varies less in candle-power than with carbons of larger diameter, and the carbon tips, as well as the crater, become a source of light. In order to maintain a reasonably long life, two positive carbons, each about one-quarter inch diameter, are used, and these are brought into abutment, and the arc thereby maintained at a predetermined position in relation to the reflector. This arrangement obviates the necessity of regulating mechanism for the upper carbon. Under normal conditions, these lamps burn 50 to 60 hours on one trimming. The lower negative carbon is actuated by the mechanism which regulates the arc. Among the special advantages claimed are a white light suitable for matching colours, a focusing arc, and steady operation. The lamps are designed to burn singly with 100-125-volts, two in series with 200-250 volts, or five in series with 500 volts, on continuous current circuits only. The efficiency of a 5-ampere lamp with single enclosing globe and reflector is stated to be 1·5 watt per mean hemispherical candle-power and 1·04 watt per maximum candle-power, including loss in resistance for 110-volt circuit. The maximum c.p. is at 60° to 70° below the horizontal.

Wiring System.

A cheap system of wiring, introduced by S. W. MARTYN & Co. (11 Pratt Street, Camden Town, N.W.), under the name "M.P." wiring system, has several good points. Twin rubber-insulated wire, either lead-covered or armoured,



BONDING PLATE FOR M.P. WIRING SYSTEM.

is employed. In the armoured variety galvanised iron wire is lapped round the pair of insulated conductors with a short lay. The two varieties are seen in our illustration of the bonding plate. This plate is the important feature of the system, and serves as a metal back plate to the recessed wooden blocks which carry the switches and any other fittings. It can be used for side entry (as in the illustration), or for back entry by bringing the cables through one or more of the four holes at the back. There are three counter-sunk holes for fixing it to the wall, and eight pairs of tapped holes for screwing down the brass clips which hold the cables. One of each of the two patterns of these clips is seen in the illustration. In the case of the lead-covered cable, the

hole at the top facilitates soldering to improve the bonding; the clip for the armoured cable is a spring washer into which the ends of the galvanised wire are fitted. With back entry, the lead-covered cable is bonded to the plate with two spring washers in a similar way, the lead sheathing of the cable being split into two flat strips for the purpose. The wood block is screwed down to the back plate by a pair of metal screws into any two diagonal holes not required for the bonding clips of the cables. A simple and effective method is also employed for bonding the cables at the distributing boards. Mr. Martyn has also introduced a plug in which a small block of wood is placed between the terminals within the cover of the plug, and is thus forced against the flex inside when the cover is screwed down, so that it acts as an effective cord grip. The switches are fitted with a simple but ingenious device for earthing the covers to the metal back plate. In the specimens of cable shown to us, the pursuit of economy has been carried rather too far, as the rubber insulation is of a distinctly inferior grade. We understand, however, that, in the case of the lead-covered cable at any rate, there will be no difficulty in supplying material of practically any quality. Even with the best cable, the system should be a cheap method of wiring, and a considerable saving in labour costs should be possible. Messrs. S. W. Martyn & Co. have prepared a pamphlet describing and illustrating the system very clearly, and offer to supply copies of it to any of our readers who may apply for it.

Iron and Steel Institute Autumn Meeting.—The autumn meeting of the Iron and Steel Institute will be held at Buxton from September 26th to 30th. The following are among the papers which have been offered for reading:—"On Electric Steel Refining," by Dr. F. Campbell; "On the Preparation of Magnetic Oxides of Iron from Aqueous Solutions," by S. Hilpert; "On the Utilisation of Electric Power in the Iron and Steel Industry," by J. Elink Schuurman. On Monday evening, September 26th, His Grace the Duke of Devonshire will hold a reception and concert in the Pavilion, and on Tuesday morning, when the reading of papers and discussions will be commenced, the Chairman of the Urban District Council will accord the Institute an official welcome. The Institute dinner will be held on Wednesday, September 28th, at 8.30 p.m., at the Palace Hotel.

South African Institute of Engineers.—The *Transactions* of this Institution for June, 1910, contains a Paper by G. A. Webb on the subject of the earthing of armoured cables and electrical machinery and switchgear with especial reference to mining practice. The discussions of this and other Papers dealing with underground winding plant at the New Modderfontein Co.'s gold mine, maintenance of electrical plant in a gold mine, rotary converters and protective devices, are also included.

Canadian Pacific Railway.—According to *Electrical World*, the Canadian Pacific Railway Co. is considering plans for the electrification of a portion of its old steam line to Prescott and the formation of an electric railway belt line around Ottawa in connection with the Hull Electric Railway, controlled by the Canadian Pacific Railway, for the purpose of creating at Ottawa a large industrial area for manufacturing sites.

Electric Traction in Paris.—It is stated that the French Government has allotted a large sum for the electrical equipment of the St. Lazare Station and the suburban lines about Paris. This is stated to have been found necessary owing to the congestion due to the increasing traffic. It is expected that the capacity of the terminal stations will be increased by some 33 per cent. by substituting electric for steam operation.

New Aluminium Alloy.—According to the *Times*, Messrs. Vickers, Sons, and Maxim's have succeeded in producing an aluminium alloy as strong as steel, and only slightly heavier than aluminium. It can be rolled, drawn, and forged, and is less corrodable than other aluminium alloys. The firm have taken out patents for this alloy, which they call "Duralumin," and will, it is said, manufacture it in large quantities at Birmingham. It is expected to be on the market in October.

Scottish Exhibition, Glasgow, 1911.—An exhibition of National History, Art, and Industry will be held in Kelvingrove Park, Glasgow, from May to October next year. A large hall will be set apart for engineering, scientific, and industrial exhibits, and a special building to be called the Kelvin Hall will be devoted to electrical apparatus and machinery. The "Lord Kelvin Electrical and Engineering Committee," with Prof. Andrew Gray and Mr. J. G. Gray as conveners, will be responsible for this section. Electricity supply at 250-volt and 500-volt D.C. will be available. Further particulars and space-application forms can be obtained from the Manager, Mr. W. H. Knight, 190 West George Street, Glasgow.

THE MANUFACTURE OF METAL FILAMENTS

Important Patent Decision

LAST week's Official Journal of Patents contains the brief announcement that the grant has been allowed of patent No. 15,021/1906. This unobtrusive notice, however, actually makes public the result of a decision with regard to metal filament lamp patents that may have far-reaching importance.

The patent in question was applied for on July 6th, 1906, by the Consortium für Elektrochemische Industrie Ges., of Nuremberg; the date of the corresponding German application was July 5th 1905. The process covered is that of heating the formed tungsten filament to a temperature close upon its melting point before it is employed in a lamp, in order to drive off any impurities and to render it denser. This may be accomplished by external heating or by passing a current through the mounted filament before sealing the bulb.

On acceptance and publication of the specification in February, 1907, the grant of a patent was opposed by Drs. A. Just and F. Hanaman, and by the Deutsche Gasglühlicht A.-G. (Auergesellschaft). The former claimed that the invention was covered by their patent, No. 23,889 of 1904, and the latter put forward six patents, including the above, as anticipating the invention. In his decision granting the patent (dated July 25th, 1907) the Chief Examiner, Mr. H. Hatfield, acting for the Comptroller, considered each of these patents separately. He concluded that though the raising of metal filaments to a white heat, or some 1,400° C., for various purposes, was covered, there was no suggestion of the employment of a temperature near 2,800° C., the melting point of tungsten, and that the subjection of the tungsten filament to such a high temperature before sealing the bulb constituted an invention.

Both opposing parties appealed to the Law Officer from this decision, and the matter came before the Solicitor-General, Sir S. T. Evans, on May 21st, 1908. The hearing was adjourned for further evidence to be filed, and the case was brought up before Sir Rufus Isaacs on April 28th, 1910. Judgment was reserved, and leave was given to file further evidence as to the melting point of tungsten, but on August 5th last Sir Rufus Isaacs affirmed the Chief Examiner's decision, dismissing the appeal with ten guineas costs, to be paid by the appellants.

The two claims of the patent are as follows:—

(1) A process for producing incandescent bodies of tungsten which consists in heating the said body almost as highly as its melting-point previous to its being employed in the lamp.

(2) A process for producing incandescent filaments of tungsten which consists in heating the said filament almost to its melting-point by means of electricity before it is employed in the lamp.

Obituary.—Mr. W. Anderson, Managing Director of the Dublin United Tramways Co., died on Wednesday of last week in Dublin. He was manager of the company for many years before his appointment as managing director in 1896.

Rubber Exhibition, 1911.—The second International Rubber and Allied Trades Exhibition will be held at the Royal Agricultural Hall, London, from June 24th to July 11th, 1911. The exhibits will illustrate the cultivation, preparation, and various uses of rubber, and the manufacturers' section will include electrical goods manufactured partly or wholly of rubber, gutta-percha, balata, asbestos, vulcanite, or ebonite. The German manufacturers are supporting the exhibition, and French and Dutch Committees are also preparing exhibits. Applications for space and further particulars should be made to A. Staines Manders, organising manager, 75 Chancery Lane, London, W.C.

Theft of Electric Lamps.—At Marlborough Street Police Court on Thursday last two counter-assistants were charged with stealing lamps, &c., to the value of £12 from their employers, the General Electric Co. (Queen Victoria Street), and two electricians and another were charged with receiving these, knowing them to be stolen property. It appeared that a systematic arrangement of stealing and receiving had been carried on for several weeks. Various sentences of imprisonment were passed on all the prisoners, with the exception of one of the assistants, who was placed under the Probation Act for three years.

THE MUNICIPAL WIRING BILL

WE have already published in our issue of August 18th a list of towns which had undertaken to give their support to the Bill to be promoted next session for giving Local Authorities power to wire houses for electric light and power, and to hire and sell fittings, &c. A few more towns have expressed themselves in favour of the Bill, and at the time of going to press the position is as follows.

The following towns have promised financial support:—

Barnes, Barrow, Blackpool, Bolton, Bradford, Bristol, Cardiff, Coventry, Croydon, Devonport, Dewsbury, Doncaster, Eastbourne, Eccles, Edinburgh, Gillingham, Glasgow, Govan, Greenock, Hastings, Ilkeston, Ilford, Londonderry, Lincoln, Maidstone, Middlesbrough, Peterborough, Portsmouth, Rochdale, St. Helens, St. Marylebone, Sheffield, Taunton, Walsall, West Ham, Wimbledon, Wigan, Wolverhampton.

The following will give their "moral" but not financial support:—

Birkenhead, Bray, Broughty Ferry, Bury, Canterbury, Colne, Dartford, Exeter, Falkirk, Fulham, Hackney, Halifax, Loughborough, Shipley, Southend-on-Sea, Warrington, West Bromwich.

The following towns have expressed themselves in favour of the proposal:—

Brighton, Carlisle, Darlington, Keighley, Swindon.

The following towns have decided to take no action:

Aberdeen, Batley, Epsom, Farnworth, Grimsby, Hammersmith, Ipswich, Liverpool, Salford, Southwark, Sutton Coldfield, Tunbridge Wells.

In Derby the matter is being considered again. Hull has decided not to support the wiring clause, but to support the clause relating to stand-by supply and supply by unauthorised undertakers; and Mansfield are taking no action as they are among those towns who already possess the necessary powers to do wiring.

It must be noted that a large number of the Borough Electrical Engineers and Committees who are in favour of the Bill being passed, have yet absolutely no intention of carrying out house wiring in competition with local contractors. They appear, however, to consider it important to be in a position to do wiring work themselves in exceptional circumstances, and they consider that they will have a freer hand in canvassing and be in a better position when they approach new consumers if they are competent to do house wiring themselves if need be. Moreover, many regard it advisable to hold their wiring powers *in terrorem* over the heads of the wiring contractors to keep them up to the mark, not only in canvassing for new consumers and pushing the use of electric cooking, heating, and power, but also as regards the general technical efficiency of the actual wiring work done.

Even Mr. A. H. Seabrook, of Marylebone, takes up the position that so long as the work is done properly, he does not care a bit who carries it out. One of Mr. Seabrook's points, however, is that unless his department at any rate supervises the installation or has it carried out to their specification, there is a danger of insufficient copper being placed in it, so that there may be subsequent difficulty in encouraging the consumer to go in for electricity largely for heating and cooking. Upon receipt of information with regard to new buildings being erected or alterations being carried out, the Marylebone Borough Council immediately writes the owner, pointing out to him the advantages of electricity supply, the cheapness of electric light with the new metal filament lamps, and the rapid strides in public favour which are being made by electric heating and cooking. He invites the owner to inspect the Borough Council's showrooms, and offers to supply him with apparatus on hire, hire-purchase, or approval, adding that arrangements can also be made for supplying the wiring installation on rental system if required.

It would be interesting to know how many wiring contractors are equally energetic; we publish in each issue of ELECTRICAL ENGINEERING a list of important additions and alterations which are projected all over the country, and yet it is surprising how few electrical contractors there are who act immediately upon this information.

As an instance of towns having wiring powers and yet encouraging the local contractors rather than organising a wiring department themselves, we may take that of Bristol. In this town a hire-purchase system of installation is offered by the Corporation, and the contractors themselves canvass for it to some extent. The work is in all cases done through a contractor, and the Corporation does no wiring work at all.

Other towns also constantly send out to the contractors in the district valuable information with regard to prospective work, and realise to the full that the interests of the contractors and the Electricity Supply Department are to a large extent identical.

MOTOR AND DYNAMO BREAKDOWNS

THE annual report of Mr. Michael Longridge, chief engineer of the British Engine, Boiler, and Electrical Insurance Co., Ltd., contains the usual statistics relating to breakdowns of machinery in 1909, details of unusual failures, and reports of trials carried out by the company. After complaining of the neglect of attendance to small gas engines, which results in a very large percentage of breakdowns with this class of engine, Mr. Longridge gives a number of typical instances of failures of steam and gas engines, and these are followed by statistics of electrical breakdowns. The electrical machines insured increased in number, as compared with 1908, by 9·8 per cent., but the breakdowns actually decreased by 4·1 per cent., and the cost of the repairs by 9·5 per cent. The rates of breakdown among the machines insured were: D.C. generators, 1 in 17·2; alternators, 1 in 17·5; D.C. motors, 1 in 8·2; A.C. motors, 1 in 9·5; starters and controllers, 1 in 25. With these may be compared the rate of breakdown with steam engines and turbines, which was 1 in 10·2, and with gas and oil engines 1 in 10·4.

Of the breakdowns of dynamos, 40 per cent. were due to failure of the rotating armature or rotor, and the same part was responsible for 37 per cent. of the failures of motors. Commutators and slip rings caused 29 per cent. of the dynamo failures and 27 per cent. of the motor failures. Stationary coils as D.C. field coils or A.C. armatures accounted for 12 per cent. of the dynamo and 20 per cent. of motor failures. Three per cent. of the dynamo and four per cent. of the motor accidents were due to brush-gear and terminals. Mechanical failures were 16 per cent. in the case of dynamos and 12 per cent. in the case of motors. Of the failures of starters and controllers, 52 per cent. were caused by the resistance coils, 9 per cent. by the contacts, 21 per cent. by the relays and release coils, and 18 per cent. by mechanical failures. Over 85 per cent. of the machines insured are motors. The breakdowns of the D.C. motors are mostly due to armature or commutator failures, while failure of the starter coils accounted for half of the breakdowns of A.C. motors.

A curious fact brought out by the tables is the large increase in the number of cases where the primary cause of the damage resulting in a breakdown is unascertained. The figures are 35 and 43 per cent. for dynamos and motors respectively, as against 23 and 26 per cent. as the average for the seven years previous to 1908. The cases of accidental damage, overloading, and deterioration due to age have decreased, while those accounted for by bad work or design have increased slightly. Dirt and neglect account for 20 and 26 per cent. of the 1909 breakdowns for dynamos and motors respectively. Almost exactly similar tendencies are shown in the corresponding figures for starters and controllers.

Among the descriptions of typical breakdowns appended is the case of a dynamo in which a short-circuit of some commutator bars was caused after two years running by a ferrule from the handle of a file, which must have been dropped in when the machine was made. In another case, a fault between some armature coils and the cast-iron drum for supporting them was caused by the blood from three mice which had crept into the armature and had been thrown out against the coils by centrifugal force. A case of an induction motor is cited in which much trouble was caused by the rotor being forced into contact with the starter, when running only, by the pressure exerted by gear, the bearings having been worn considerably. Piercing of the shields over the stator windings so as to allow inspection of the gap is recommended. Another breakdown with an 11,000-volt induction motor was found to be due to the destruction of the insulation by nitric acid formed by decomposition of the air by brush

Digitized by Google

discharges. As the presence of moisture is necessary for the formation of acid, adequate protection can be obtained by enclosing the conductors in waterproof tubes and sealing them at the ends to prevent the egress of air or moisture. Finally, Mr. Longridge emphasises the importance of refraining from touching high-tension apparatus for some ten minutes after disconnection from the supply, so as to allow the electrostatic charge to leak away. Discharging to earth before touching is recommended. The rest of the report deals with boiler accidents and trials of steam engines. A report of a test on a 500-kw. exhaust-steam turbo-generator is included.

THE WIRING CONTRACTOR'S POINT OF VIEW

MANY consumers will doubtless be consulting their wiring contractors with regard to a circular letter which has been issued by the Metropolitan Electric Supply Co. This company, which supplies large shops and houses at 100 volts, has been hard hit by the reduction in output due to the extended use of metal filament lamps, and has notified its consumers that the price of current for lighting will be increased from 5½d. to 6d. per unit to those consumers who are not prepared to avail themselves of the company's new "Contract" tariff. The "Contract" tariff is the fixing of a minimum annual charge, depending on the size and nature of the installation. The consumer is to pay this in quarterly instalments, and it entitles him to twopenny units up to this minimum, after which 1d. per unit only is charged. As a definite "quotation" of the minimum charge will be made to each consumer applying for particulars, it will be possible to calculate from the previous year's consumption whether the acceptance of the new tariff or the payment of 6d. per unit will be the more economical, but it must be borne in mind that if the two totals are not very divergent the acceptance of the contract rate would enable the consumer to employ electricity for heating and cooking or to increase his consumption in other ways at a small cost. It is obvious that for the same cost three times the number of units can be consumed at 2d. as at 6d. If a consumer uses, or estimates that he will use, 400 lighting units per annum, and the quotation for the minimum annual charge is £12, it is true that he would save £2 on the sixpenny tariff, but he could have an additional 1,040 units for the extra £2, and it would probably pay him to accept the "Contract" offer and to use electricity largely for heating and cooking. By the way, a useful rough and ready short cut for forecasting the probable consumption of new consumers is to multiply the candle-power of each lamp by the number of hours it will be burnt per diem at this time of the year; on adding up the number of candle-power-hours per diem of the whole installation and dividing by three an approximate estimate of the number of units that will be consumed per annum may be arrived at.

An article in another column deals with the central station man's point of view of the present controversy relating to municipal wiring powers. Although there is no doubt that the proposed Bill will be fought tooth and nail by the Contractors' Association—and rightly so—yet individual contractors should remember that there are two sides to every question. Whether the local authorities obtain wiring powers or not, there is no doubt that the wiring firms can obtain much assistance from the electricity supply department, and that the energetic wiring contractor with a good connection, and doing first-class work, is always regarded as a friend to the supply undertaking. If a condition of almost personal hostility between the contractor and the central station engineer is worked up to, it is the contractor who stakes most, and must be prepared to lose most if the Bill is passed by Parliament. The contractor should remember that a large number of the municipal electrical engineers have no intention at present of putting their wiring powers into force if they obtain them, and although the contractors as a body are quite right to fight the Bill stubbornly in Parliament, little is to be gained by the creation of unpleasantness locally. If the Bill is passed, and every wiring contractor went out "on strike," the supply authorities could soon take over their work; if the Bill does not pass, the wiring contractor, who has abused the municipal electrical engineer and has damned the electricity committee and the whole system of municipal trading, will be in no better position than the one who has gone on working peacefully and has paid his subscription to his association, upon whom he relies to carry on the opposition tactfully and systematically. Local assistance can be afforded by petitioning the members of Parliament for the division, but not by accusing the borough electrical engineer of incompetence and ignorance, and his committee of unfairness and harsh dealing.

The Leicester Corporation is setting a good example to the wiring contractor in the pleasant process of "burying the hatchet." According to the *Electrical Contractor*, the Corporation is accepting the decision of the law courts in the proper spirit, and, recognising that it is to the benefit of all concerned that the wiring of consumers' houses should be proceeded with without intermission, is doing all in its power to assist the wiring contractors. The latter, on their side, have offered to relieve the Corporation of the stock of fittings and wiring material it holds, and a schedule is to be drawn up to assist this process.

WIRELESS TELEGRAPHY

WITHIN the last few weeks, an amalgamation of interests has been effected between the Anglo-German Wireless Syndicate, Ltd., the new company holding the British rights of the Lepel patents, and the Compagnie Générale Radiotelegraphie, the French company who have for some years exploited the Rochefort spark system of wireless telegraphy. By this arrangement the French company will hold the rights of the Lepel patents in France.

Our readers may have noticed in the Patent Record of ELECTRICAL ENGINEERING, August 25th, that the Comptroller-General granted patents, in spite of opposition, to both Baron E. von Lepel and the Gesellschaft für Drahtlose Telegraphie (the owners of the Telefunken system) for transmitters comprising in each case metal plates separated by a ring of paper. We understand that the Gesellschaft für Drahtlose Telegraphie have only obtained their patent (which covers certain special details) on condition that a specific reference is inserted to the Lepel patent, which is of earlier date. As is announced in our Patent Record this week, the decision of the Comptroller to grant the Lepel patent is to be appealed against. The appellant in this case is not the Telefunken company, but Mr. Valdemar Poulsen, who holds that the non-arcing property of the Lepel transmitter is due not, as claimed by the inventor, to the short gap and rapid cooling of the air, but to the presence of hydrogen in the gap produced by the burning of the paper. One of Poulsen's patents covers the use of hydrogen for this purpose.

It appears that the Federal Cabinet of Australia have now definitely decided to place a contract with the Australian Wireless, Ltd., for two stations at a cost of £6,150, this sum not to include land and buildings. These stations are to be at Sydney and Fremantle. The original quotation of this company was £4,150 for stations on the sea coast, but the Admiralty and Defence Department have required that the Sydney station be placed 15 miles inland, for which the contractors are obtaining an extra £2,000, increasing their power plant about 50 per cent., and employing two towers instead of one. The antenna is to be supported on two wooden towers 275 ft. high. These towers will be about 16 ft. square at the base, tapering to 8 ft. at a height of 225 feet, the last 50 ft. consisting of a pole. The earth will consist of a network of copper wires buried in the ground and covering 30 acres. Petrol engines will be employed, and 30-40-kw. generators. The "Telefunken" system is being adopted, and the stations are to be completed in 52 weeks. The guarantee is for a minimum distance of 1,250 miles during day-time.

According to the *Review of the River Plate*, the Compañia Marconi de Telegrafia Sin Hilos report a profit of $65,105 on the past year's working.

It has been stated that the Bill introduced by Sir Edward Sassoon for the compulsory installation of wireless apparatus on all vessels carrying over 50 persons may be proceeded with next year. At a meeting of the North of England Steamship Owners' Association at Newcastle last week, however, the Bill was reported to have been withdrawn by its promoters.

Wireless telegraphy has again played an important part in the saving of life at sea. The *Mauretania* on Friday last received a message from the liner *Devonian* giving brief particulars of the burning of the *Westpoint* in mid-ocean, and as the result of this information the *Mauretania* was enabled to pick up a small boat containing some of the survivors.

Telegraph and Telephone Congress.—On Monday the second International Telegraph and Telephone Congress, at which twenty-two nations are officially represented, was opened at the Sorbonne, Paris, by M. Millerand, Minister of Public Works.

Electric Power in Ontario.—According to the *Times*, the 120,000-volt transmission line of the Ontario Hydro-electric Commission for the supply of power in Toronto from Niagara Falls was worked at full pressure as far as Dundas on Thursday last, and will be in operation delivering power to Toronto on October 1st.

ELECTRICAL ENGINEERING PAPERS AND DISCUSSIONS AT THE B.A. MEETING

(By Our Special Correspondent)

A NUMBER of electrical engineering subjects were discussed at the meeting of the British Association for the Advancement of Science, held at Sheffield from August 31st to September 7th, although the chief interest was centred in the joint discussion on "Mechanical Flight" by the engineering and mathematical sections, and the account given by Sir J. J. Thomson of the progress of his investigations to ascertain the nature of positive electricity.

ELECTRIC TRACTION.

Electric traction was dealt with by Prof. W. E. DALBY during the course of his presidential address to Section G (Engineering) on Thursday, and by Mr. Philip Dawson in a lantern lecture on the Electrification of the L. B. & S. C. Rly. on Monday.

Professor Dalby's address was entitled "British Railways: Some Facts and a Few Problems." He commenced with some figures to illustrate the large part that railways play in our national life. The capital invested in the railway companies of the United Kingdom is nearly twice the amount of the national debt; the gross income of the companies is within measurable distance of the national income; and to produce this income every inhabitant of the British Islands would have to pay annually £3 per head; over six hundred thousand people are employed by the railway companies; and about eight million tons of coal are burnt annually in the fire-boxes of the locomotives. In 1908 the total paid-up capital of the railway companies was 1,310 millions, and the gross receipts amounted to 120 millions. The net revenue, after deducting the working expenditure, was 43½ millions, corresponding to 3·32 per cent. of the total paid-up capital. At the end of 1908 there were 23,205 miles of line in operation, corresponding to 53,669 miles of single track, including sidings, and 1,278 millions of passengers (exclusive of season-ticket holders) and 491 million tons of goods were carried. In 1907 nearly 515 million tons of goods were carried.

Professor Dalby then analysed the costs, and showed that out of the total working costs (averaged from 1905 to 1908) of 41·68 pence per train mile, locomotive power represented only 12·07 pence per train-mile. He pointed out that if the whole of the locomotive power could be obtained for nothing the average dividend would only be increased by 1¼ per cent., although dividends on the ordinary stock would be increased by about three times this amount. To increase the number of passengers carried is therefore far more important than locomotive efficiency, and therefore on suburban lines the speed of the journey, and the necessity of rapid acceleration of the train after each stop is of supreme importance. An acceleration of thirty miles per hour in thirty seconds is considerably below what may be applied to a passenger without fear of complaint, but it is just about as much as a steam locomotive can do with a train of reasonable weight. But with electric traction the limitations imposed on the steam locomotive by the construction-gauge and by the strength of the permanent way are swept away. The equivalent of the boiler power of a dozen locomotives can be instantaneously applied to the wheels of the electric train, and every axle in the train may become a driving axle. Thus the whole weight of the stock, including the paying load, may be utilised for tractive purposes.

Since December 18, 1890, when the City and South London Railway was opened for traffic, electric traction on the railways of this country has been gradually extended, and at the end of 1908 there were in the United Kingdom 204 miles of equivalent single track worked solely by electricity and 200 miles worked mainly by electricity, corresponding to 138 miles of line open for traffic. Of this 102 miles belong to the tube railways of London and 201 miles to the older system formed by the District and the Metropolitan Railways and their extensions. The total number of passengers carried (exclusive of season tickets) on the 138 miles of electrical track during the year 1908 was nearly 342 millions, being roughly one-third of the total number of passengers carried on all the railways of England and Wales during the same period. The average cost of working this traffic is 22·3d. per train-mile. This figure includes the service of the lifts. The charges work out as follows, in pence per train-mile: Locomotive power 8·40, repairs and renewals of carriages and wagons 1·50, maintenance of permanent way 2·40, traffic expenses 5·22, general charges 1·52, rates and taxes 2·36, Government duty 0·088, compensation 0·116, legal and miscellaneous 0·75. The corresponding total receipts were 38·65d. per train-mile. The working expenses are thus 58 per cent. of the total receipts. Comparing this with the figures for the whole of the lines in England and Wales, it is seen that the cost for locomotive power on the electric railways is about two-thirds of the cost on steam lines per train-mile, the cost for repairs and renewals of carriages and wagons about one-half, and the cost for traffic expenses about one-half. The two kinds of working are not, however, strictly comparable, as all the conditions of traffic in the two cases are different, and the length of the electric lines is relatively so small that the problems which arise out of the transmission of electric power over long distances are excluded. [Those of our readers who desire to study these statistics further can obtain the corresponding figures for 1909 in a "Blue Book" just issued by the Board of Trade.—Ed. *E.E.*]

Professor Dalby then outlined the various systems of electric traction employed, and pointed out, in connection with the H.T. single-phase system used on the Lancaster, Morecambe, and Heysham branch of the Midland Railway and on one of the suburban sections of the London, Brighton, and South Coast Railway, that it has not only shown itself to be quite suitable for dealing with a stopping traffic where quick acceleration is the dominating condition, but it contains the germ of practicable long-distance electrification. The near future, he said, may see the extension of the system to the line between London and Brighton, giving a frequent non-stop service which would bring Brighton in point of time nearer than the suburbs on opposite sides of London are to one another.

The concluding part of the address dealt briefly with power signalling and automatic signalling.

THE SOUTH LONDON SINGLE-PHASE RAILWAY.

Before Section G on Monday, Mr. PHILIP DAWSON described the main features of the South London Elevated Electric Railway. The general characteristics of this line and some details have already been described in our columns (ELECTRICAL ENGINEERING, Vol. V, 1909, pp. 132 and 307). Mr. Dawson said that several objections had been made to the single-phase system. The principal ones were that the single-phase motor gave a low acceleration, was heavier, and had a lower efficiency, involving a greater energy consumption per ton mile, and also that repairs and maintenance were heavier. Experience on the South London Elevated Electric Railway, however, had proved that the acceleration was quite as good as that of the District line and Underground lines in London generally, and that it was a good deal better than that obtained on some other continuous-current systems. This, he said, depended upon the capacity of the generating plant, and was independent of the system adopted. The total extra weight over that for a continuous-current equipment for a complete train did not exceed 10 per cent., and he thought it would probably be found to be nearer 5 per cent. The energy consumption per ton mile was less with single-phase than with continuous-current, being 70 to 80 watt hours per ton mile in the former case, as compared with from 100 to 125 in the latter. There was nothing to give him any reason to think there would be any considerable increase under this head.

In describing a few technical details, Mr. Dawson mentioned that the commutators of the motors had run 50,000 miles without repair. The power factor of the whole system was about 80 per cent. The bows on the cars were controlled by compressed air. The working part of the bow was a grooved aluminium strip filled with grease, and after eight months' use the trolley wires did not show the slightest wear. The aluminium strips ran 15,000 miles before renewing; the cost of renewal was 6s. 8d. Special attention was drawn to the great differences in the height of the trolley wires, this varying from 21 ft. 6 in. to about 10 ft. No

Digitized by Google

trouble had been experienced with any of the transformers on the trains, although the circuit was made and broken 800 times per day. Double insulators were used for the first time on any railway, and they had been tested up to 14 tons stress, the maximum working stress being one ton. Electrically they had been tested up to 65,000 volts, and some to 70,000 volts. Even at this pressure the insulators did not break down, but merely sparked over. Some interesting photographs were shown of the erection of the overhead structure whilst the steam-train service was being continued. Ordinarily collapsible ladders were used, but as the work progressed the men would often cling to the overhead wires while the ladders were drawn away to let a train pass. Various forms of suspension were illustrated, the most important departure from standard practice being at Denmark Hill, where there is only 1½ inches clearance between the bow and the coach roof. The catenary wires were, he continued, 12-strand mild steel 0·088 in. diameter, tested to a strain of 10,000 lbs. Every insulator was working in compression. The insulators had horizontal spindles, so that they were cleaned by the rain running off them. By experiment it had been found possible to replace an insulator in three minutes.

With regard to the drop in the return circuit, continued Mr. Dawson, which the Board of Trade had limited to 20 volts, he believed that it was down to 12 or 15 volts. In the main distributing stations at Denmark Hill all the connections were worked by means of signal levers, as the railway staff which had to do the work were familiar with these. An interesting portion of the repair-shed equipment was a petrol electric coach on the auto-mixte system, which is used for inspection purposes and for supplying current for lighting during inspection and on breakdowns, also for testing purposes. In order to reduce the current bill, a sign had been placed at every spot where the motorman should cut off the current before entering a station. It had been found that any failure to do this sent the consumption up by 5 or 10 per cent., and as the current bill ran into many thousands of pounds, it was an important matter that this regulation should be observed. In conclusion, Mr. Dawson pointed out that although the conditions of the line were as bad as they possibly could be, there being rising gradients out of every station, the acceleration was over one mile per hour per second. Further, since the line had been opened there had not been the slightest trouble with the equipment either mechanically or electrically. He did not intend this short review to be a contribution to the question of single-phase *versus* continuous-current traction. No one could say that one system or the other was the best. It depended entirely on the conditions. As to energy consumption of the train, there was very little to choose between the two. But the energy consumption at the power station was a totally different matter, because additional losses occurred in transformation with the continuous-current system.

Dr. SILVANUS P. THOMPSON congratulated Mr. Dawson on the fine piece of work for which he had been responsible, especially in view of the prejudice which still existed against the single-phase system. The end of the single-phase system had not yet come. Only quite recently he was looking at the drawings of a 2,000-h.p. single-phase locomotive. For long-distance work there were obvious advantages in this system.

Sir WILLIAM WHITE and Mr. DUGALD CLERK also congratulated Mr. Dawson, who, in a brief reply, mentioned that, with the exception of the construction under the low bridges, the whole of the equipment was working as originally designed. At Victoria Station, however, the overhead constructional details had had to be reconstructed three times.

THE PRICE OF ELECTRICITY.

A Paper on this subject by Mr. EDWARD W. COWAN was presented to the section dealing with "Economic Science and Statistics" on Thursday. The author contended that electrical engineers were wrong in assuming as a fundamental principle that electricity must not be sold to one class of consumers at a lower percentage profit than to another class. He maintained that a system of attempting to price every part of a supply according to the cost of producing it was scientifically faulty; in fixing a price, Demand, he said, should be the predominating influence. A great potential demand for electricity for power and heat uses, for instance, awaited the sufficient lowering of prices. He had estimated that electricity at three units a penny would compare favourably, for heating, with coal at 15s. to £1 per ton burnt in open hearths. Apparently, therefore, his ideal system would be to supply electricity for power and heating at this price, and to increase the price for lighting sufficiently to make the aggregate income cover the total cost of production, profit, &c., if this price would not be higher than that for which the consumer could obtain his light by other means. An interesting appendix to the Paper reviewed the legal aspect of the question, and gave the opinion, which the author said was endorsed by Mr. Sydney Morse, that "classified" tariffs—after the manner of railway rates—are not illegal.

Mr. S. L. PEARCE (Chief Electrical Engineer to the Manchester Corporation), who opened the discussion, said that he personally was in accord with the abstract principles put forward by Mr. Cowan, but the great difficulty was to translate them into a scientific tariff. Economically, electrical engineers were on unassailable ground in adopting the cost of production as the basis of their charges, but it was a matter for argument as to whether this method enabled the most to be got out of their undertaking. He held the view that some remission might be made in the standing charges to certain classes of consumers whom it was desirable to get on the mains. For instance, seven or eight years ago extension plant was put down costing £8 to £10 per kw., while to-day it could be put down for about £3 per kw., and it would not be fair if the power consumer who had been the means of introducing this extra load, should not have some remission as regards the fixed charge.

Mr. W. B. WOODHOUSE (Chief Engineer to the Yorkshire Electric Power Co.) thought most people would agree that the principle of equal profits from all consumers might quite reasonably and fairly be supported. There were limitations to the policy of charging what an article would fetch. All electric supply undertakings had certain monopolistic privileges. Although the electrical industry suffered from more restrictions than any other, any abuse of the few privileges it now possessed in the way of extorting unreasonable profits from any one class of consumer, might lead to further restrictions.

Mr. S. J. WATSON (Chief Electrical Engineer, Bury) pointed out that if they charged any particular portion of the supply at "by-product" prices, there was a danger of the "by-product" supply becoming the principal production, and this would lead to disastrous results. He did not see any possibility of the principle of charging the same prices to persons using electricity under the same conditions, being departed from.

Mr. A. J. CRIDGE (Assistant Electrical Engineer, Sheffield Electricity Department) expressed disagreement with the author on some points, and

PROFESSOR ASHLEY was surprised that electrical engineers should regard the principles underlying the paper as open to discussion. Electricity supply, he said, was precisely on all fours with railway charges, and, as an economic fact, they must all accept the principle of charging what the traffic will bear.

NEGLECT OF SCIENCE BY COMMERCE AND INDUSTRY.

On Monday, Section B (Chemistry) and Section L (Educational Science) held a joint meeting to discuss the question of the neglect of science by commerce and industry. Mr. R. BLAIR, who opened the debate, had prepared a lengthy paper, in which he referred to the fact that the engineering industry appreciated as much as, if not more than, most others, the training given in the technical colleges; and, thanks to the relations between the principals and the heads of engineering firms in the neighbourhood, the colleges had no difficulty in placing all their best students into works at the end of their training.

One of the main defects of college training was neglect of the question of cost in design and the commercial side generally. All engineering firms existed for the purpose of making a profit, and modern conditions made it essential that all technical students should fully realise the importance of economical design and cheap upkeep. Employers wanted men who could in their designs give the most for the money. It was quite insufficient to teach design on physical principles alone. Methods of production, ease of repair, depreciation, and even conditions of transit in large machines, should all be taught in connection with effective design.

On the other hand, in order that heads of firms should more fully appreciate the need for science in business, he recommended special courses in technical training for them. The present comparative indifference on the part of business men toward science in relation to their businesses, was due to the conflict of interests of the various trades unions, the unsatisfactory state of the law regarding employers, and other difficulties, and nothing short of a far-reaching Parliamentary scheme was likely, as far as his experience went, to alter the situation materially.

He deplored the lack of application of scientific principles to canvassing the various markets of the world, a matter to which attention is being called repeatedly by British Consuls abroad. Another suggestion which the speaker made was that consultative committees should be attached to all facul-

Digitized by Google

ties or departments, such committees to be advisory, and to be composed of commercial leaders and business experts of the highest reputation. Probably this was the best way of enlisting the sympathy of industrial and commercial men.

Subsequent speakers included Sir W. Tilden, Dr. H. T. Bovey, F.R.S., late principal of the Imperial College of Technology; Dr. E. H. Griffiths, of Cardiff, Sir William White, Mr. J. E. Stead, F.R.S., and Prof. E. H. Armstrong. Sir W. Tilden thought the greatest ignorance on the part of employers in relation to science was to be found in the electrical and chemical industries. He supported this statement by a reference to the exceedingly low salaries frequently offered to fully qualified men. He also criticised the Government in this connection, and said it was impossible to find an official, from a Cabinet Minister downwards, holding a superior administrative position, who had received an education in which physical science had formed any substantial part. The measure of Parliamentary sentiment in favour of science was to be found in the moderate grants made for this purpose. The Imperial College of Science was quite inadequately endowed. Dr. H. T. Bovey said the only means of securing the universal application of science to industry, was by the organisation and centralisation of technical education. In America it was a *sine quâ non* for a young engineer to have received a diploma in some technical institution of repute before he could obtain employment. Sir William White and other speakers differed from the view that England was behind other countries in the application of science to industry. Principal Griffiths deprecated abuse of the industrial leaders. There were faults on both sides, and the cause of the present unsatisfactory state of affairs was the absence of means of communication between those working in the universities and commercial men. If the universities could not provide the type of men required in business, they must put their house in order. The need for co-operation was supported by other speakers. Sir William White suggested that a laboratory should be attached to all commercial undertakings, a policy which had led to some remarkable results in the steel industry.

OTHER PAPERS AND REPORTS.

On Thursday, the Committee on *Electrical Standards* presented a report upon the experiments that had been made since last year for improving the construction of practical standards for electrical measurements.

On Monday, Mr. H. E. Wimperis described *an accelerometer for the measurement of road resistance*, invented by him and constructed by Messrs. Elliott Bros. The instrument consists of a brass box about four inches across, containing a copper disc mounted on a vertical pivot and "damped" in its motions by a permanent magnet. The centre of gravity of the disc is purposely removed from the axis so that when the box moves forward, one side of the disc tends to lag behind, thus partially winding up a coiled spring and actuating a pointer which moves over a scale. To render the reading unaffected by any accelerations at right angles to the direction of motion, a second parallel axis is fitted, which is geared to the first one, and has attached to it masses having the same mass moment as the disc itself. Couples about these two axes add up in the direction of motion, but neutralise one another in any direction at right angles. The accelerometer therefore reads in one of the three directions of space only, and is not affected by even violent movements in the other two directions. With this instrument the author has measured the road resistance of various classes of road and has obtained figures varying from 50 to 210 lbs. per ton. On main line railways the resistance is usually from 12 to 30 lbs. per ton, depending on the speed. He has also measured the acceleration of practically all the London electric railways with his instrument. The acceleration on the London, Brighton and South Coast single-phase line was 1·9 ft. per second per second, which was identical with the figures given by Mr. Dawson. The braking retardation was found to be 5·8 ft. per second per second, which was about twice that of the Great Northern, Piccadilly & Brompton Railway, which had about the same acceleration. The main use to which the instrument has been put hitherto, however, is in connection with motor-cars.

Another Paper read on Monday, to which more discussion might have been devoted with advantage, was by Dr. H. J. S. Sand, of Nottingham University, on *a new method of hermetically sealing iron wire into glass*. The glass is fused round the iron wire, and while it is still hot a small piece of heated steel tube surrounding the wire is pushed a few millimetres into the glass. After cooling, the steel tube is soldered to the wire. The vacuum tight seal is produced between the glass and the inner surface of the steel tube, which on cooling becomes slightly stretched, and at the same time compresses the glass. He pointed to the great possibilities of this method in connection with electric lamp manufacture, and the saving which would be effected by obviating the use of platinum. It is to be regretted that this Paper was presented in Section A (Mathematics and Physics) instead of Section G (Engineering).

On Tuesday, before Section G, Prof. Silvanus P. Thompson gave a short Paper on *Electro-mechanics*, in which he dealt mathematically with the laws governing electromagnetic apparatus, and pointed out some of the relations between them.

Before Section A on Tuesday, Dr. Charles Chree opened a discussion on *atmospheric electricity*, and dealt principally with the potential gradient existing in the atmosphere, mentioning incidentally the influence of an electric field on the growth of plants, and phenomena of thunderstorms, &c. In the discussion Sir Oliver Lodge referred to the experiments in connection with *electricity in agriculture*, in which he is interested, and mentioned that it had been found that no electricity should be given to the plants in bright sunshiny weather. In dull weather the application of positive electricity had been found to give an increase in the output of the crops of 30 per cent. In one experiment, however, a field of beans, when positively electrified, had been found to give a smaller crop than usual. He had tried to induce the farmer to repeat the experiment with negative electricity, but he would not.

Another Paper on Tuesday was one by Professor Ernest Wilson and W. H. Wilson, on *a new method for producing high tension discharges*. Energy is taken from an alternating or continuous current source and stored in a magnetic field by an inductance; it is then permitted to surge into a condenser, which forms with the inductance a low frequency oscillatory circuit. When the energy is accumulated in the condenser the latter is mechanically bridged across the primary winding of an induction coil, with which it forms a high frequency oscillatory circuit. The energy is then transmitted by the secondary winding of the induction coil to the work circuit, and can be of an oscillatory or uni-directional character according to the purpose in view. The apparatus is intended for radio-telegraphy and X-ray work.

On Wednesday, Prof. Alfred Schwartz described a machine for measuring the hysteresis of *india rubber*, and the application of this test to the determination of various grades of rubber, of the quantity of rubber in a given mixing, of the degree of vulcanisation, and the deterioration due to age or high temperature.

THE STREET LIGHTING IN WESTMINSTER

WE regret to see that the correspondence with regard to the street lighting contracts in Westminster is being continued in the London daily papers, and that the controversy has been extended to the provincial Press also. Statements are still being made by chairmen of gas companies at general meetings and by gas advocates on every possible occasion, giving a one-sided version, and in most cases a misleading one, of the circumstances. We have before us a pile of letters and reports of statements of this character, and the replies of representatives of the electric lighting interests, but we refrain from publishing them. The facts of the case are simple. Sixty-six out of a total of 1,055 electric street lamps in Westminster will be replaced with gas lamps for the next five years at a price practically the same as that for which the electric lighting has been supplied with the arc lamps that are being displaced, and against the wishes of the residents in the street in question. Figures have been published, and their accuracy, we believe, has not been disproved, showing that the gas company will be supplying the new lighting at considerable loss. Moreover, certain conditions of the specification and local circumstances prevented the electricity supply companies concerned from tendering for the whole of the area at the same price as that which had been charged for these 66 lamps, and instead of electricity displacing gas, as is being done elsewhere, the gas interests recovered a little lost ground. These are the plain facts regarding the "victory" for gas that has been proclaimed so loudly all over the country.

In the meantime, as was shown in the article published in our issue of August 25th, electric lighting is rapidly superseding gas for street lighting elsewhere, and not only is the lighting more satisfactory and constant, but it is also cheaper. Figures of actual costs which we published in that article prove this indisputably. The advantage is apparent even for side-street lighting, for which electricity was certainly severely handicapped before the advent of the metal filament lamp. In Marylebone, Hampstead, and Shoreditch gas will soon be displaced entirely by electric lighting in the streets. Our article giving descriptive details of these three street lighting systems—which are typical—is being reprinted in pamphlet form, and we have no doubt that its circulation over the whole country will soon lay the Westminster bogey.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 1st, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

18,436/09. **Wireless Telephony.** V. COLIN and M. JEANCE (Paris). This specification describes an oscillation generator consisting of several arcs in series, each struck between a water-cooled positive electrode of copper and a carbon electrode some 1 to 5 mm. in diameter. The arcs are enclosed in a chamber in which some insulating gas or liquid is circulated. A variable-voltage D.-C. dynamo supplies current to the generator. An intermediate resonance circuit is employed, and a number of telephones connected in series are connected across that coil of the second oscillation transformer, which is in the aerial circuit. Three figures.

18,590/09. **Storage Batteries.** P. MARINO (London). The lead supports of positive plates are protected from peroxidation by coating them with a composition consisting of a solution of gutta-percha or celluloid to which powdered antimony or graphite or both, have been added. The composition conducts equally as well as lead, and does not crack on bending the lead. Further, it does not cause local action.

24,950/09. **Reflectors for Tubular Lamps.** A. W. BEUTELL (London). The wires are laid along an open metal channel or conduit, which is closed by means of the reflector or a separate cover. The double-ended lampholders are fixed to the wire conduit at suitable intervals. Other constructional details are covered. Nine figures.

2,432/10. **Metal Filament Lamps.** FELTEN & GUILLEAUME-LAHMEYERWERKE A.-G. In order to ascertain whether the complaints of consumers that lamps have broken down after a short period of burning are justified, a substance that is chemically affected by the light, heat, or current is placed in the bulb. The lighting of the lamp will then produce discolouration or some other indication of its proper working. The insertion of checking devices of different degrees of sensitiveness for recording the duration of the passage of current through a lamp, is also covered by this patent. One figure.

6,668/10. **Protective Devices.** BRITISH THOMSON-HOUSTON Co. and E. B. WEDMORE. This patent covers the use of leakage devices in various parts of a distribution system so arranged and set that those controlling sections remote from the source of supply will operate without affecting the supply to the other sections. One figure.

8,409/10. **Ventilation of D.-C. Machines.** SIEMENS BROS. DYNAMO WORKS and W. PARKER. Efficient ventilation of the field coils is secured by an arrangement of guide plates in conjunction with a fan of equal or less diameter than the armature, which causes currents of air to flow axially between the coils. One figure.

Opposition to Grant of Patents

15,021/06. **Tungsten Filaments.** CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE GES. On appeal to the Law Officer, the grant of this patent has been allowed. It covers the process of raising tungsten filaments to a temperature nearly as high as the melting point previous to insertion into the bulbs. See also page 576 of this issue.

3,881/08. **Exhaust Steam Plant.** W. SCHWARZ. On appeal to the Law Officer, this patent has been granted. It covers a heat accumulator with a series of chambers in which water is circulated, and into which the exhaust steam is passed. The water is broken up into drops, so that intimate contact with the steam is ensured.

17,349/08. **Wireless Telegraphy.** E. VON LEPEL. An appeal has been lodged against the decision of the Comptroller granting this patent. It covers the disc discharger of the Lepel system. (See ELECTRICAL ENGINEERING, Vol. V., pp. 434 and 1086.)

8,104/08. **Filaments of Refractory Oxides.** G. MICHAUD and E. DELASSON. As the result of an appeal to the Law Officer, the decision of the Comptroller allowing the grant of this patent has been upheld. (See ELECTRICAL ENGINEERING, November 18th, 1909, p. 976.)

16,528/09. **Tungsten Filaments.** C. H. WEBER. The decision of the Comptroller to grant this patent is to be appealed against. The patent covers a process for preventing the oxidation of tungsten powder. (See ELECTRICAL ENGINEERING, January 6th, 1910, p. 16.)

Application for Restoration of Patent

14,851/06. **Telephone Exchanges.** KJÖBENHAVNS TELEFON-AKTIESELSKAB. Aktiebolaget L. M. Ericsson & Co. have applied for the restoration of this patent, covering apparatus for the automatic distribution of the operating service in telephone exchanges, which expired in June, 1909, owing to non-payment of the renewal fee. Opposition must be entered at the Patent Office on or before October 31st next.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: HIRST and ANGOLD, 29,068/09; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*), 7,821/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: BUTLER and GIBBINGS [Cable boxes] 20,067/09.

Dynamos, Motors, and Transformers: SMITH, GREEN and GLOVER [Induction motors] 5,985/10.

Electric Ignition: SIMS MAGNETO Co. (High-tension magnetos) 15,380/09; L. DUTHEIL, R. CHALMERS ET CIE. [Sparking plugs] 1,130/10; BRIGGS, 2,438/10; ZAHRINGER, 10,820/10.

Heating and Cooking: LAKE (*Parker-Clark Electric Co., U.S.A.*) [Heating units] 18,954/09.

Incandescent Lamps: TURQUAND [Battery lamps] 18,756/09; LAKE (*Parker-Clark Eltctric Co., U.S.A.*) [Filaments] 18,954/09; STEVENSON [Boxes for packing metal filament lamps] 26,873/09.

Instruments and Meters: JOHNSON and BILLINGTON [Meters] 16,332/09; FARRAND [Prepayment meters] 19,660/09; BRITISH THOMSON-HOUSTON Co. and D'ARCY [Meters] 6,667/09.

Switchgear, Fuses, and Fittings: HAMER [Lift control] 18,555/09; MEDWAY and SCOTT [Automatic switchgear for remote control of motors] 18,675/09; COWPER-COLES [Reflectors] 19,037/09; MURPHY [Rectifier] 19,030/09 and 3,410/10; BUTLER and GIBBINGS [Conduit couplings] 20,067/09; SHEWARD [Lamp-holder] 26,048/09; WYNNE [Switch] 28,429/09; HIRST and WHITE [Bell pushes] 28,557/09; NEUDÖRFFER [Switch boxes] 5,835/10; ADAMS MANUFACTURING Co. (*Cutler Hammer Manufacturing Co.*) [Switches] 6,160/10 and 6,363/10; BERG [Time-switch] 9,590/10.

Telephony and Telegraphy: LAKE (*Electric Press Bulletin Co.*) [Telegraph bulletin printers] 23,324/09; LEON and LEWIS [Telephone transmitters] 26,779/09; KAJIURA [Duplex telegraphy] 8,141/10.

Traction: LAKE (*Bour*) [Block signalling] 22,319/09; SOC. IN ACCOMANDITA PER L'UTILIZZAZIONE DELLE INVENZIONI ING. BEER [Block signalling] 26,487/09; JONES and INTERCHANGEABLE BRAKE BLOCK Co. [Brake blocks] 26,526/09.

Miscellaneous: VIRY [Apparatus for controlling movements from a distance] 18,847/09; COWPER-COLES [Smoke combustion in furnaces] 20,021/09 and 20,557/09; FAIRWEATHER (*Electric Shoe Polisher Co.*) [Shoe brushing machine] 21,005/09; DESSAUER [Radiography] 23,455/09; GAEDE [Vacuum pump] 27,457/09; BLUM [Electric vaporizer] 2,286/10; HINDEMANN [Illuminated signs] 4,096/10; GRATH and DREXLER [Coin-freed bell alarm] 8,827/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electrochemistry: SOC. L'AIR LIQUIDE [Fixation of nitrogen and oxygen at high temperatures] 18,475/10.

Switchgear, &c.: SIEMENS-SCHUCKERTWERKE GES. [Fuses] 18,528/10; WEISSMANN [Lamp-holder] 18,738/10; BEIGE [Lamp-holder] 19,033/10.

Miscellaneous: ALLGEMEINE ELEKTRICITÄTS-GES. [Centrifugal compressors] 17,474/10; KOVATCH [Coal-cutters] 18,135/10.

The following amended Specifications can now be obtained.

MARKS (*Chicago Oil Co.*) [Induction coils] 318/09; CROOKELL [Lamp-shade attachment device] 3,195/09.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: BRITISH THOMSON-HOUSTON Co. (*W. C. Fish, U.S.A.*) [Lamp with two arcs in series] 11,078/02.

Distribution Systems, &c.: G. S. ELLIS and A. M. TAYLOR [Automatic control of storage batteries in distribution systems] 10,495/05.

Dynamos, &c.: BRITISH THOMSON-HOUSTON Co. (*W. M. Dey, U.S.A.*) [Motor-control system for ship-steering gear] 10,275/01; P. M. BOUCHEROT [Reciprocating electric motor] 10,299/05; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Compounding of alternators] 10,555/05.

Instruments, &c.: M. KALLMANN [Iron-wire resistances for testing instruments] 10,202/05; J. M. TOURTEL [Prepayment electricity meter] 10,509/05.

Switchgear, &c.: O. L. PEARD [Fuse-box] 11,404/02; M. KALLMANN [Iron-wire resistances for relays, &c.] 10,202/05.

Telephony, &c.: W. S. STELJES [Printing telegraphs] 11,278/98; P. A. LORRAIN and A. DENNERY [Poles and insulator supports] 9,279/00.

Traction: B. MAGRINI [Tramcar roof] 11,203/02; R. THAYER [Trolley vehicles with storage batteries] 11,264/04.

CORRESPONDENCE

THE ASSOCIATION OF CONSULTING ENGINEERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Whilst I am in entire sympathy with any movement which has for its object the raising of the status of the consulting profession, I am somewhat doubtful as to the ability of the proposed association to accomplish all that might be desired. My experience tends to confirm the opinions expressed by Mr. Boot in your last issue, and I fear that an association of consulting engineers, whose members are necessarily members of the Institution of Civil Engineers, will be of little or no assistance to the general body of professional engineers who confine their attention to consulting practice.

Membership of the "Civils" is no guarantee of professional integrity, and one is in continual competition with such members who pose both as consulting engineers, and agents or engineers to machinery insurance companies. In the latter connection I may say that I have in my possession a letter addressed to some of my clients by a corporate member of the I.C.E. offering, as chief engineer of a large insurance company, to draw up specifications for electric power work and to supervise its erection for a stated fee, whilst travellers of the same company regularly call on me asking me to recommend clients to insure their machinery with the company they represent.

Similarly, one finds oneself in competition with members of the Institution of Civil Engineers, who on one day act as consulting engineers for public institutions, and on another call as representatives of manufacturing companies to discuss quotations for engineering appliances intended for clients whom later on they will directly approach in one capacity or another.

It is clear, then, that membership of the Institution of Civil Engineers does not carry with it the white certificate of a blameless professional life, and it is therefore difficult to fully appreciate the motive in limiting the membership of the proposed Association to members of the "Civils," as this limitation has the appearance of casting a stigma not only on professional engineers who are not members of that body, but also on the institutions to which they have the honour to belong.

Moreover, the existence of the proposed, or any other, Association will not prevent men who have not the professional instinct from acting unprofessionally, seeing that it is impossible to penalise them in any way; hence the benefits to be conferred by membership must be in other directions than in protecting them against unfair competition.

It therefore behoves those consulting engineers who are yet outside the pale to consider whether or not it is worth while to join the "Civils" in order to qualify for and obtain the advantages of membership of the proposed Association of Consulting Engineers; and, on the other hand, it is for the Council of the "Civils" to consider whether this is quite the most desirable method of recruiting their ranks.

Yours, etc.,

FRANK BROADBENT, M.I.E.E.

4, Queen Street Place, London, E.C.,
September 5th, 1910.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

GAS ENGINES.—A complete new catalogue of gas engines, comprising seven sections, published in March and June of this year, has been issued by Messrs. Crossley Bros., Ltd. (Openshaw, Manchester). The first section contains a number of interesting photographs of the works at Openshaw, with notes on the work of the various departments. Small gas engines of from 1½ to 28 b.h.p. are dealt with in the second section, which includes brief illustrated descriptions of their constructional details, and some particulars of lighting sets with direct-coupled dynamos. Section three describes engines of from 30 to 80 b.h.p., suitable for both town and producer gas, while section four deals with suction gas engines of from 80 to 150 b.h.p., fitted with an improved system of low-tension magneto ignition. This, and all the other sections, are illustrated with very clear photographs and drawings. Section five deals with large single-cylinder engines of from 175 to 200 b.h.p., for mill and factory driving. An extra heavy flywheel is provided for electric lighting work. Two-cylinder engines of 150 to 300 b.h.p., for working off blast furnace, coke oven, suction or pressure gas, are described in section six, and four-cylinder vertical engines, also suitable for working with waste gases, in section seven. These last are specially adapted for electric generating stations and mill driving.

ENAMEL-INSULATED WIRE.—A leaflet from the Allgemeine Elektricitäts-Gesellschaft (Berlin) contains an article on the advantages of enamel-insulated wire for field bobbins and the coils of instruments, arc lamps, &c. Enamel-insulated wire with an outer covering of cotton or silk has been introduced for ignition apparatus.

ELECTRICALLY DRIVEN ROLLING MILLS.—A booklet from the Allgemeine Elektricitäts-Gesellschaft gives a long list with a few particulars in each case of electrically driven non-reversing rolling mills with A.E.G. equipment. Some 20 photographs illustrating typical installations are reproduced.

MOTORS AND DYNAMOS.—A 32-page illustrated list from the Adnil Electric Co., Ltd. (Adnil Building, Artillery Lane, London, E.C.), gives particulars and prices of standard continuous-current motors of from 3 to 68 h.p. output, and dynamos of from 2·5 to 48 kw. capacity. Some general technical information with regard to the construction and design of these mechines is included. Motor-generators, back-geared motors, metallic and liquid starters, and flexible couplings are also listed.

WIRING FITTINGS.—Messrs. Loxley & Co. (Cabinet Chambers, Basinghall Street, Leeds) have sent us a copy of a new leaflet describing the V.B. cleat ceiling roses for surface wiring. Only one screw is required to fix this rose, and no jointing or looping-in is necessary. It is especially suitable for temporary work. A description of the ceiling rose appeared in ELECTRICAL ENGINEERING of December 2nd, 1909 (Vol. V., p. 1028).

GAS ENGINES.—A booklet from the Key Engineering Co., Ltd. (Trafford Park, Manchester) contains an illustrated description of the constructional details of the latest type of double-acting four-cycle gas engine of the pattern developed by Messrs. Ehrhardt & Sehmer, of Saarbrucken. This is an abbreviated and partially rewritten translation by Mr. Leonard Andrews of an article in *Stahl & Eisen*. Engines of this description are now being built by Galloways, Ltd., of Manchester.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

MOTOR STARTERS.—Messrs. Wm. Geipel & Co. (St. Thomas Street, London, S.E.) have issued a new illustrated catalogue of motor starters and panels, rheostats, &c. Special features are the renewable contacts and contact brushes. The resistances are made up of renewable units of wire spirals on hard asbestos tubes. No soldered joints are used. Among the special rheostats listed are interlocked theatre dimmers, and other apparatus fitted with the Ward-Leonard interchangeable resistance units.

TELEPHONES.—A booklet issued by the Western Electric Co., Ltd. (North Woolwich, London), primarily intended for the use of contractors and electricians, contains concise particulars of telephone apparatus and accessories suitable for private installations. We reviewed the company's full catalogue in our last issue.

ELECTRIC BELLS.—Messrs. Gent & Co., Ltd., Leicester, have issued a new catalogue of electric bells, &c.

DRILLS.—A leaflet from the A.E.G. Electric Co., Ltd. (121 Charing Cross Road, London, W.C.), illustrates a portable electric drill for holes up to 2 in. diameter.

CANDLE FITTINGS.—The Kingolite Co. (164 Wardour Street, London, W.) have sent us a list of the Kingolite fittings for carbon or metal-filament lamps. These are provided with a screw flange at the bottom for keeping the translucent candle cylinder perpendicular and rigid.

ELECTRICAL SUPPLIES.—A complete revised trade catalogue is being issued by Drake & Gorham, Ltd. (66 Victoria Street, Westminster, London, S.W.). This is divided into nine sections. The first covers Osram, Tantalum, and carbon filament lamps of all shapes and sizes. The second is devoted to arc lamps, and includes the new "Butt" flame lamp. A section on cables and flexibles is followed by a list of switchboards, switchgear, lighting accessories, and bells. A good illustration is given of a well-designed porcelain fuse carrier for distribution boards. In the section on heating and cooking apparatus, the latest Bastian heaters, as well as the Gray patent oven (described in this issue) are listed. Auto-transformers, two-part insulators for obviating binding wire, and the new D.G. continuity clips for ensuring efficient bonding of wiring conduit, are also listed. The last section is devoted to lighting fittings, and includes a large number of artistic designs and several patterns of weather-proof lanterns for outdoor use. Among the last-named is a cast-iron fitting taking six 100 c.p. Osram lamps.

STEEL CONDUIT AND POSTS.—An illustrated list is to hand from John Spencer, Ltd. (Globe Works, Wednesbury, Staffs.). This covers all manner of iron and steel piping, water-, steam- and gas-pipe fittings, wiring conduit, tramway trolley-wire poles, and arc-lamp standards. The illustrations of the last-named include a 65-foot, three-lamp standard erected at Bournemouth.

LOCAL NOTES

ABERDEEN: *Electricity Department Report.*—Mr. J. A. Bell, the Borough Electrical Engineer, has presented his annual report. The adoption of a flat rate of charging has proved successful. Hiring out heating apparatus has increased the connections to the equivalent of 11,368 33-watt lamps—nearly double last year's figure. He recommends that the price of energy for heating be reduced from 1½d. to 1d. per unit. The total number of units sold for all purposes during the year was 5,430,065, including 90,442 for the tramways. Motors representing 387 h.p. have been added to the mains, and there are 181 new consumers, and mains corresponding to 3·6 additiona miles of frontage have been laid. Mr. Bell points out that there are only four tramways in the Kingdom supplied with electricity from joint stations at a cheaper rate than at Aberdeen.

AUSTRALIA: *Perth Tramway Employees' Strike.*—Reference to this strike was made in our last issue. Advices from Perth now state that the secretary of the Tramway Employees' Union has been sentenced to a fine of £50 or two months' hard labour for a breach of the Arbitration and Conciliation Act by aiding and abetting the strike. Two other executive officers of the Union have been sentenced to a fine of £10 or three weeks' hard labour.

BARROW: *Tramway Purchase.*—The Council are considering the advisability of exercising their option to purchase the local tramway undertaking from the British Electric Traction Co.

BERMUDA: *Proposed Electric Railway.*—It is stated that a Canadian company is endeavouring to obtain powers to build 30 miles of an electric railway at an estimated cost of £200,000, to connect all parts of Bermuda, and it is further stated that all equipment for the line is to be purchased in the United States. Here is evidently a case where either the National Electrical Manufacturers' Association or the Electrical Committee should bring pressure to bear upon the Bermuda Government, either directly or through the Home Government, to refuse the concession unless British material is to be bought.

BEXLEY HEATH: *The Tramway Management.*—At last week's meeting of the Bexley Heath Urban District Council two motions were on the agenda paper to the effect that the tramway manager should be given notice or be asked to resign, and another that an entire change in the working and management of the tramways was necessary. An amendment was passed, however, giving instructions for the immediate preparation of the financial statement for the year ended March 31st. 1910, with a view to its being considered by the Council at an early date.

BOMBAY: *Electricity Supply.*—"After full investigation of the many conditions which differentiate an Oriental from a European city," the directors of the Bombay Electric Supply and Tramways Co. have decided to comply with the strong views expressed by the municipality and by a large majority of consumers, and offer to abandon the present maximum demand tariff, and to substitute a flat rate tariff. The new tariff proposed, which has to be accepted by the municipality, is a charge of 5d. per unit for all purposes, with a cumulative discount of 3 per cent. upon each completed 250 units consumed monthly, the aggregate discount not to exceed 45 per cent.

BRADFORD: *Trackless Trolley System.*—At last week's meeting of the Tramways Committee, a sub-committee was formed to carry into effect the provisions of the Bradford Parliamentary Bill with regard to omnibuses on the trackless trolley system.

Tramway Accounts.—Mr. C. J. Spencer, general manager of the Bradford Tramways, has presented his report. The total working expenses per car mile come out to 7·149d. and the income 10·777d. Only one item of the expenses has increased since last year—namely, that of cleaning, salting, and sanding the track, which has been increased owing to the cost of keeping the track open for traffic during snowstorms. All the other items of expenditure are less, and the total expenses represent a saving of ·072d. per car mile over last year. The power expenses were 2·073d. per car mile. The revenue of the parcels department continues to increase, and 675,719 parcels were handled. The net profit on the year's working was £32,365, of which £20,000 is allocated to the relief of city rates, and the balance is transferred to reserve and renewals account. Six new Mountain and Gibson trucks put into service during the year have been fitted with a new type of track brake, using cast-iron shoes of the type recommended by the Municipal Tramways Association. Eight automatic electric track point controllers made by a local firm have been erected, and are working well. The mechanical device for the operation of the cars over two gauges has given very little trouble in actual operation once the initial difficulties were overcome.

CAPE TOWN: *Electric Light and Power.—The African World and Cape-Cairo Express* refers to the replacement of the four public electric supply plants at Cape Town by supply from one central power-house owned by the Corporation, which was carried out last year. The estimate of the power which the Government would have to buy was 1,500,000 units per annum, which is sold at 1½d. per unit, and the actual consumption from July 1st, 1909, to July 30th, 1910, came out within 1,000 units of this figure. The Government has still on hand a quantity of its old plant which it desires to sell.

COVENTRY: *Electric Tramways.*—An agitation is going on in favour of purchasing the Coventry Tramway Company's undertaking. The Corporation have until February in which to give the statutory notice.

GOVAN: *Electricity Supply Accounts.*—The burgh electrical engineer, Mr. T. C. Parsons, has submitted his report and accounts for the year ended May 15th. The coal costs come out to 0·198d. per unit sold, and the works and distribution costs to 0·477d. per unit sold. The total working costs, including management, are 0·813d., and the total, including interest and sinking fund, 1·461d. per unit sold. Compared with other stations of a similar size—*i.e.*, with an output of 3,000,000 units per annum or less, there are only eight with better total costs, two with better works costs, and only one with better coal costs. The average price obtained per unit sold was 1·61d. The total number of units sold was 2,624,684—an increase of 268,317 over last year. Of these 1,602,029 were sold for power. The units sold for lighting show an increase of about 36,000 over last year, the figures for which were about 2,000 below the previous year, presumably due to metal filament lamps. Interesting tables are given showing the percentage revenue from various sources, from which it appears that 38 per cent. of the revenue is for power, and if the revenue for lighting engineering works, etc., be added to this, the total received from the power consumers comes out to 55 per cent. Another interesting table gives the class of consumers connected to the mains. There are 142 power consumers, 442 domestic houses are lighted, 259 shops and offices, 58 licensed premises, and 46 engineering works and factories. Schools, churches, and public buildings bring the total to 986. Yet another table gives the total h.p. in motors on hire to the various trades.

GREENOCK: *Street Lighting.*—The price for street lighting is to be reduced from £18 to £15 per lamp.

HARROGATE: *Street Lighting.*—Considerable interest is being aroused through the chairman of the Gas Company's criticism of the Council for lighting part of its streets electrically, and not accepting an offer by the gas company, which he contends was more advantageous to the Corporation. The matter is being commented on at length in the local press.

NOTTINGHAM: *Tramways.*—The laying of about two miles of new line is being proceeded with, and interlacing track is being adopted on a short portion of the route.

PLYMOUTH: *Tramways.*—There have been serious complaints of overcrowding, and the Board of Trade has taken the matter up.—The Borough Surveyor, Electrical Engineer, and Tramways Manager have submitted a report on the relative costs of the ordinary trolley system and the trackless trolley system on a proposed new route.

PRESTON: *Tramways.*—The Preston municipal accounts, which have been issued by the borough auditors with their report, show that although 45,000 fewer passengers were carried by the tramways than during last year there was a profit balance of about £4,000, which was carried to reserve fund.

SALFORD: *Trams.*—The annual report of the general manager of the Salford Tramways, Mr. G. W. Holford, shows a net profit balance of about £19,000, £17,000 of which it is proposed to allocate to relief of rates, and the balance to depreciation and renewals fund. The number of units used per car mile was 1·63, and the average traffic receipts per car mile 10·09d. The average car miles per day is 113 per car:

Digitized by Google

the average car hours per day 15·25, and the average working expenses per car mile 4·464d. excluding power and 6·459d. including power.

SOUTH AFRICA: *Bulawayo.*—The introduction of Osram lamps for public lighting is said to have saved the Corporation over £2,000 per annum.

SUNDERLAND: *Proposed Sales Department.*—A sub-committee of the Electricity Committee has been appointed to report on a scheme for the establishment of a show-room and sales department, staffed by a sales manager, two canvassers, an installation inspector, a prime cost clerk, and a typist.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

AUSTRIA.—The communal authority of Smischow have decided to proceed with the construction of an electric tramway at an estimated cost of £42,000.

BUENOS AIRES.—Messrs. Zacarías Marioni y Hermano are to erect an electrical installation for the custom house, at a cost of about £22,000.

COBHAM (Surrey).—Competitive tenders for street lighting are being asked from the Gas Company and the Woking Electricity Company. The present oil lamp standards could be converted.

DARTFORD.—Application is to be made to the Local Government Board by the Urban District Council for sanction to borrow £11,000. A sum of £10,000 is required for plant and buildings, and £1,000 for mains.

DUBLIN.—The Lighting Committee have issued their quarterly report. They are continuing their policy of postponing any extension work not urgently required. To meet the winter load, however, eight new 100-k.w. transformers and two spares, and four 50-k.w. transformers, will be wanted, the expenditure for which has already been sanctioned by the Local Government Board in connection with the anticipated extension of mains.

DURBAN.—Tenders are invited by September 28th for an elevated jet condenser and piping, switchboard, rotary convertors, cables, and transformers. Tenders to Messrs. Webster, Steel & Co., 5, East India Avenue, Leadenhall Street, London.

EGYPT.—The *Board of Trade Journal* states that tenders are invited for the supply and installation of machinery, &c., for establishing an electric light system in the town of Beni-Souef. Tenders, on stamped paper (obtainable from Mr. A. L. Webb, C.M.G., Queen Anne's Chambers, Westminster, S.W.), to be addressed to "M. le Directeur de la Section des Municipalités et Commissions Locales, Ministère de l'Intérieur," Cairo, by noon on October 31st. Specifications, drawings, &c., may be obtained at the same address on payment of 200 piastres (£2 1s.). A deposit of 2 per cent. of the value of the offer is required with each tender. Contractors must have a responsible agent in Egypt.

GRASSINGTON.—A scheme for the lighting of the streets by the Grassington Electric Supply Co. at £15 a year has been approved by the Parish Council.

LA PLATA.—A company has been formed to take up a concession granted to Mr. A. Lemousin for an electric light and power house in the city of La Plata. The River Plate Electricity Co. is already established there. Messrs. J. G. White and Co. are engaged on a contract for a new station for them and for placing a large portion of the overhead mains underground.

SOUTH AFRICA: *Potchefstroom.*—A Government inquiry is being held on the proposal of the Potchefstroom Municipality to adopt an electric lighting scheme at an outlay of £20,000.

STALYBRIDGE.—An inquiry has been held into a loan of £22,268 for electrical extensions. During the inquiry it was announced that the total loss on the electricity and tramways undertakings of the joint board during the seven years of its existence, amounted to £81,000.

TRANSVAAL.—The Transvaal Gold Mining Estates, Ltd., are about to purchase a large power plant.

URUGUAY.—The Municipal authorities of Tacuarembó invite tenders for an electricity supply works at St. Fructuoso. Tenders to be received at the Secretaria de la Intendencia Municipal de Tacuarembó, Tacuarembó, by September 30th.

WALTHAMSTOW.—Tenders are invited by September 9th for a storage battery at the electricity works.

MISCELLANEOUS

BILBAO.—The Compañía del Tranvía de Bilbao has been granted a concession for constructing a tramway line.

MANCHESTER.—The Waterworks Committee require an electric derrick crane. Tenders to the Town Hall by September 12th.

NEWCASTLE.—Extensions of the Newcastle Corporation tramways have been decided upon.

RETFORD.—Criminal Lunatic Asylum about to be erected near Retford. A light railway to connect with the G.C.R. is contemplated. Home Office.

RUSSIA.—Messrs. S. Pearson and Son, Ltd., of 10, Victoria Street, S.W., have commenced a survey of the coast route from Sevastopol to Alushta for the purpose of building a narrow-gauge single track electric railway, which, it is stated, will be financed entirely by British capital.

SANTA FE.—The municipal authorities called for tenders for the electrification of the tramways about a year ago. All the tenders received were rejected, and fresh tenders were invited. These fresh tenders have just been received, and it is stated that none of them are as advantageous to the Corporation as the previous one. The *Review of the River Plate* states that the delays are due to the fact that the Council do not call any proper technical advice.

SOUTH AFRICA: *Cape Town.*—It is proposed to equip the Cape Town docks with an electric travelling crane and other modern improvements.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

PROVINCES.

BURY.—New County Court to be erected. H.M. Office of Works.

CAMBUSLANG.—A constabulary station at corner of Church and Mansions Streets. County of Lanard Standing Joint Committee.

CHAPEL-EN-LE-FRITH (DERBYSHIRE).—Theatre. Frank Edwards.

DEVONPORT.—New Methodist Church, Keyham.

DUBLIN.—New Fire Brigade Station. City Architect.

FINCHLEY.—Proposed "Brent Garden Village." P. W. Home, Church End, Finchley, architect.

GODALMING.—New pumping station buildings at Ockford. J. H. Norris, Borough Surveyor.

GRAYS (ESSEX).—Electric theatre.

LEICESTER.—Primitive Methodist Church, Humberstone Road.

LETCHWORTH.—Extensions to Printing Works of the Letchworth Printers, Ltd. Edgar Simmons, Architect.

MOSSLEY.—New Drill Hall for the West Riding of Yorkshire County Association. W. Cooper, 4 Kirkgate Buildings, Huddersfield.

NELSON.—Cottage Hospital.

NELSON (GLAMORGAN).—Police station at Nelson. T. M. Franklen, Clerk to the Glamorgan County Council, Cardiff.

STORNOWAY.—Roman Catholic Church. Alex Macdonald, architect. Ross & Mackenzie, builders, Stornoway.

TODMORDEN.—£300 is to be spent for the electric lighting of the Town Hall by electricity.

WESTCLIFF-ON-SEA.—New St. Saviour's Church.

WEYBRIDGE.—Congregational Church Manse.

In a discussion at the British Association on Tuesday, Prof. H. E. Armstrong, F.R.S., said he did not want to use electricity in his house, but was being forced to do so by the bad quality of modern gas. Prof. Armstrong's address is 55 Granville Park, Lewisham, London, S.E.

Industrial Education.—The proposed "National Industrial Education League" for promoting the establishment of a system of industrial training for the children of the labouring class, and a consequent extension of school life, is gaining considerable support. We have received a booklet containing a list of the supporters of the scheme, including Members of Parliament and of the London County Council, Trades and Labour Councils, Trades Unions, and Educational Associations. A National Conference on the supject will shortly be held at the Guildhall, London. Further particulars can be obtained from Mr. R. Applegarth, 49 Craig's Court House, Charing Cross, S.W.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

BOURNEMOUTH.—Considerable discussion took place at the Town Council meeting on Tuesday in reference to a recommendation by the Tramways Committee that a tender of Messrs. W. Griffiths & Co., at £2,904, for a supply of Belgian tramway rails should be accepted. An amendment was moved in favour of the acceptance of the tender by a Leeds firm at £3,299 on the ground that this tender was for English rails. The Tramway Manager, in reply to questions, said it was generally known that Belgian rails were superior to English. On the amendment being put, 5 voted for it and 19 against.

DUBLIN.—The tender of the A. E. G. Electric Co., Manchester branch, has been accepted for the electric light installation of the South Dublin Union Workhouse, at the sum of £2,587 4s., and £250 for five years' maintenance. This tender was £500 less than the tender of any Irish firm. Only six tenders were received in response to the Union's advertisement. [The advertisement was not inserted by the Union in our paper.]

SOUTH AFRICA: *Transvaal.*—The order for the electrical equipment for the new air-compressor station of the New Modderfontein Gold Mining Co., Ltd., has been placed with the British Westinghouse Electric and Manufacturing Co., Ltd., Maschester, and includes a number of 1,000-b.h.p. three-phase motors.

CAPE TOWN.—Messrs. Veritys, Ltd., London, have secured the contract for electric light fittings for the Parliament Buildings, Cape Town.

DELAGOA BAY.—An order for a battery and "Entz" booster equipment has been placed with the Chloride Electrical Storage Co., Ltd., by the Delagoa Bay Port and Railway Council.

JOHANNESBURG.—The municipality have placed a contract with Messrs. Siemens Bros. & Co. for the supply of 2,277 A.C. meters, and with the A.E.G. Electric Co., of South Africa, for 88 D.C. meters.

THE D.P. Battery Co., Ltd., have just concluded contracts for the supply of their batteries to the District Councils of St. Annes-on-Sea, Naas (Kildare), the Chorlton Board of Guardians, and for a number of private installations. The maintenance of these batteries for terms of years has been undertaken by the company. They have also secured orders for three batteries for South Africa for mining and other purposes.

THE Foster Arc Lamp & Engineering Co., Ltd., inform us that their "Q" type lamp was selected for the illumination of the People's Palace in the Mile End Road. Messrs. H. J. Cash & Co., Ltd., were the contractors.

APPOINTMENTS AND PERSONAL NOTES

The War Office has appointed Capt. G. Thorp, Royal Engineers, to be instructor in the Schools of Electric Lighting of the Regular Forces.

Mr. A. J. Howard has been appointed Borough Electrical Engineer to Taunton. Mr. Howard was at one time Chief Assistant at the Taunton Electricity Works. The short list included Mr. A. W. Clay, Deputy Electrical Engineer of Accrington, Mr. W. J. Sowter, Engineer at Bray, and Mr. W. F. Stamp, Deputy Engineer at Devonport. The salary commences at £200 per annum, with half the pupil fees.

On Friday Mr. J. W. Fraser was the recipient of a handsome writing-case, subscribed for by the employees of the London County Council Tramways power house at Greenwich, upon his leaving the department to take up a Government appointment.

Mr. Ashton Bremner, who has relinquished the post of Chief Engineer to the Burslem Council owing to the undertaking being absorbed in the new County Borough of Stoke, has been presented with a travelling bag by the employees.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

British Insulated & Helsby Cables.—Interim dividend announced of 4 per cent. actual for the half-year.

Aberdeen Suburban Tramways Co.—At the half-yearly meeting on Thursday it was announced that there was a satisfactory increase in traffic. A 2½ per cent. dividend is being paid, and mortgages are being paid off to the extent of £1,500 during the half-year, and £2,500 subsequently, leaving the outstanding mortgages at £4,000.

Jarrow & District Electric Traction Co., Ltd.—Particulars of £20,000 debentures, created August 5rd, 1910, have been filed.

United Electric Car Co.—Dividend of 2½ per cent. declared for the year ended June 30th.

Vera Cruz Electric Light, Power & Traction.—The accounts for 1909 show that the deficit of £4,600 shown on the previous year's working has been converted into a credit balance of £2,000. The accounts were adopted at the third ordinary general meeting of the company last week.

Canadian General Electric Co.—Quarterly dividend of 1¾ per cent. to September 30th on the common stock, a half-yearly dividend of 3½ per cent. for the half-year to September 30th at the rate of 7 per cent. per annum on the preference stock.

Metropolitan Electric Tramways.—For the thirty-three weeks to August the gross traffic receipts show an increase of £42,000. compared with the same period for last year. If this rate of increase is continued throughout the present financial year, the company point out that it will be possible to pay 6 per cent. on the ordinary shares, as against 5 per cent. in 1909, and 4½ per cent. in the two previous years.

MISCELLANEOUS BUSINESS NOTES

PRICE OF COPPER.—Messrs. George Smith & Sons, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 5s. to £58 15s. per ton (last week, £58 5s. to £58 15s.).

LIQUIDATIONS.—Official notice has been given of the release of W. Allnutt, liquidator of the Empire Electric Light & Power Co., Ltd.

CHANGE OF ADDRESS.—The British Central Electrical Co. have moved to 84 Hatton Garden, London, E.C.

SWITCHBOARD FOR SALE.—A 160-ampere battery switchboard is for sale. See advertisement on another page of this issue.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"General Foundry Practice." By Wm. Roxburgh. (London: Constable & Co.) 10s. 6d. net; by post in U.K., 10s. 11d.; abroad, 11s. 3d.

The Mining Institute of Scotland. List of Members, August, 1910. (Hamilton: J. Barrowman, Sec.)

"The Application of Arc Lamps to Practical Purposes." By Justus Eck. (London: Rentell & C., Ltd.) 2s. 6d. net, by post in United Kingdom, 2s. 9d.; abroad, 2s. 10d.

"Electric Motors." By H. M. Hobart. Second Edition. (London: Whittaker & Co.) 18s. net. By post in U.K., 18s. 6d.; abroad, 19s. 4d.

"Construction and Working of Internal Combustion Engines" By R. E. Mathot. Translated from the French by W. A. Tookey. (London: Constable & Co., Ltd.) 24s. net. By post in U.K., 24s. 6d.; abroad, 25s 3d.

"British Standard Specification for Portland Cement." Engineering Standards Committee's Report No. 12. Revised edition. (London: Crosby Lockwood & Son.) 5s. net. By post in United Kingdom or abroad, 5s. 2d.

"Power and its Transmission," by Thomas A. Smith. (London: E. & F. N. Spon.) 2s. net; by post in U.K. or abroad, 2s. 2d.

NEW COMPANIES

W. H. SAYER & CO., 10 New Street, Bishopsgate Street, London. Capital £500. Electrical and mechanical export merchants.

GEORGE HILL & CO., 12 Cornbrook Park Road, Manchester. Capital £4,000. To take over the existing business of electrical engineers, &c.

W. V. WAITE & CO.—Registered by Jordan & Sons, 116 Chancery Lane, London. Capital £1,000. Electrical, consulting, and general engineers, &c.

UNITED LIGHTING & MAINTENANCE CO., 35 Cock Lane, Snow Hill, London. Capital £2,000. To take over the business of electrical engineers, &c., now carried on at the above address.

Telegraph Traffic.—It is stated that a closer working arrangement between the Anglo-American Telegraph Co. and the American Telephone & Telegraph Co. has been successfully effected.

SUMMARY

Mr. V. A. H. McCowen, until lately Borough Electrical Engineer to the Salford Corporation, and previously for thirteen years in a similar position in Belfast, died last week. We have also to record the death of Mr. W. Finlay, last year's President of the Electrical Contractors' Association. (Page 588.)

The date of the Electrical Exhibition at Olympia in 1911 has been definitely fixed. (Page 588.)

The new line of the London County Council Tramways from Woolwich to Eltham, has been for the most part equipped on the double trolley system, to avoid possibility of interference with the magnetic instruments at Greenwich Observatory. (Page 589.)

An illustrated article describes a new sealing-in machine for metal filament lamps. (Page 590.)

We describe the most recent developments of the Lepel system of wireless telegraphy, including an integrating device for intensifying the received signals, and a method of transmitting a number of different musical notes in rapid succession. The equipments of a commercial station in Jamaica, and the experimental station at Slough, are also described. (Page 591.)

The electrical appliances exhibited at the Dental Exhibition included several patterns of drilling "engines," small resistance furnaces, projectors and mouth lamps, water-heaters and sterilisers. Automatic electrically-driven air-compressors, used in conjunction with atomisers, and electrically-heated hot-air syringes, and some novel root-drying and cautery instruments, were exhibited. (Page 592.)

A letter which is being sent by the Electric Supply Publicity Committee to the principal papers throughout the country, calls attention to the great increase of electric street lighting in London, in order to dispel the false impression that London, instead of continuing an electrically-lighted city, is about to return to gas. (Page 593.)

The leader and two other members of a gang which has been successfully making compensation claims for bogus accidents on tramcars for some years, have been convicted. (Page 593.)

A letter from Mr. E. W. Cowan refers to the purport of his Paper read before the British Association. (Page 593.)

Among the Specifications published by the Patent Office on Thursday last was one by M. T. Medway and M. D. Scott for a means of preventing the reversal of the armature current of a motor before the armature has come to rest. The main switch is held open by a solenoid supplied with current generated by the motor.—A silicon-carbide filament, which incandesces in the open air without oxidising, is covered by the Parker-Clarke Electric Co. of America.—H. Hirst and A. E. Angold protect a flame arc lamp with converging carbons, one of which is supported on a slow-burning carbon, actuated so as to feed upwards as it is consumed by the heat.—An appeal has been lodged against the decision of the Comptroller to grant two patents to

Digitized by Google

J. Howden & Co. for exhaust steam accumulator plant.—A patent by R. J. Grindle relating to accumulator plates, consisting of rolled up strips of corrugated lead, expires to-morrow, after a life of fourteen years. (Page 594.)

AN article deals with the question, "What is 'Association' Cable?" (Page 595.)

AN arbitration was commenced in London on Monday to settle a difference between the Torquay Tramways Co. and the Torquay Corporation with regard to the system of electric traction to be adopted on the Torbay Road route. The Board of Trade have refused to sanction the Dolter system after October 1st on any of the lines in Torquay, and with regard to all the lines except the Torbay Road, the Company are advised that they have powers to use the overhead system, although the Corporation disagree with this view. The arbitration, however, has special reference to the Torbay route, which is protected by certain clauses in the Company's Act. The Company asked to be relieved from the obligation to use the Dolter system, and have produced many facts and figures to prove that it has been both a technical and commercial failure. (Page 595.)

BELFAST Corporation are installing arc lamps in two streets experimentally.—A poll is being taken in Torquay on the question of tramways.—Competition between the Manchester Corporation Electricity and Gas Departments was deprecated at the last Council meeting. (Page 596.)

ACCRINGTON Corporation propose an expenditure of £16,000; Burnley, £1,800; Colwyn Bay, £23,000; Dublin, £3,150; Stockport, £7,000; and West Bromwich, £11,386. Edinburgh Corporation require turbo-generators and condensing plant. Warrington Corporation have been granted a loan of £6,000. (Page 597.)

ARRANGEMENTS FOR THE WEEK

SATURDAY, SEPTEMBER 17TH.

Institute of Marine Engineers.

3 p.m. Visit to the Engineering and Machinery Exhibition, Olympia.

7 p.m. Paper to be read:—"Electro-Magnetic Transmission for Main Marine Propulsion," by Jules Lecoche.

WEDNESDAY, SEPTEMBER 21ST.

Municipal Tramways Association.

10.30 a.m. Annual Conference at Bradford. (1) Presidential Address by Mr. C. J. Spencer, President. (2) "The First Decade of Municipal Tramway Working," by Alderman S. Flint (Leicester). (3) "The Comparative Durability of Brake Shoes and Tyres," by J. W. Dawson (Assistant Engineer, Bradford Tramways).

Society of Engineers.

Visit to Engineering and Machinery Exhibition, Olympia.

THURSDAY, SEPTEMBER 22ND.

Municipal Tramways Association.

10.30 a.m. Annual Conference at Bradford. (1) "Tramways in Relation to Town Planning," by A. Baker (General Manager, Birmingham Tramways). (2) "Lubrication of Car Bearings," Report prepared by Messrs. E. Cross, R. L. Acland, P. J. Pringle, and T. R. Smith.

7 p.m. Association dinner at Great Northern Victoria Hotel.

FRIDAY, SEPTEMBER 23RD.

Municipal Tramways Association.

10 a.m. Annual Conference at Bradford. Business meeting.

SATURDAY, SEPTEMBER 24TH.

Association of Engineers in Charge.

5.15 p.m. Visit to Engineering and Machinery Exhibition, Olympia.

7.45 p.m. Lecture on "Wireless Telegraphy: its Maritime Importance," by G. Langler Bullocke (by special permission of Mr. Marconi).

International Congress of Radiology and Electricity.—An international congress, at which papers on radiology and physical electrical phenomena will be read, was opened at the Brussels Exhibition on Tuesday. Sir J. Thomson, who, with Prof. E. Rutherford, of Manchester University, was to have represented his Majesty's Government at the Congress, is unable, through private business, to accompany his colleague, and Prof. Rutherford will act alone as delegate for Great Britain.

OBITUARY

VICTOR A. H. MCCOWEN.

IT is with the deepest regret and a feeling of personal loss that we record the death, on Thursday, of Mr. V. A. H. McCowen, who was for many years Borough Electrical Engineer of Belfast, and more recently Borough Electrical Engineer of Salford.

Mr. McCowen has been associated with the electricity supply industry since the earliest days. He was one of the engineers with J. E. H. Gordon & Co., and was chiefly employed in the erection of the Crystal Palace District Electric Supply Co.'s station, one of the first designed on the "Oxford" H. T. continuous-current system. In 1894 he was appointed Borough Electrical Engineer at Belfast, while the station there (a gas-engine station to the designs of Sir A. B. W. Kennedy) was under construction, and between leaving Gordon's and taking up this appointment, he was connected with the Killarney Electric Supply Co., whose station was designed and erected by him. During the thirteen years he was at Belfast, the undertaking developed to one of considerable magnitude, and the gas engine plant was entirely displaced by steam plant in load. The steam station at Belfast was entirely designed by Mr. McCowen, and it is interesting to note that he showed great foresight in this, arranging the lay-out with a view to subsequent extensions, and the ultimate supply of a tramway load. He left Belfast in 1907 to take up the position of Borough Electrical Engineer to the Salford Corporation, in succession to Mr. C. D. Taite. The South Lancashire climate suited neither his health nor that of his wife, and shortly after his wife's death he became ill, and about a year ago had to obtain leave of absence for a long period. A few months ago, after a prolonged stay at Bath, his condition had only improved slightly, and he felt obliged to tender his resignation at Salford. Although of a retiring disposition, Mr. McCowen had many friends in the electrical world, particularly in municipal electrical engineering circles, who will deplore his loss.

At Monday's meeting of the Belfast Corporation, Alderman Finnigan, in moving a resolution of sympathy with the relatives of Mr. M'Cowen, said their late electrical engineer was a thorough gentleman in all his ways, and when Belfast lost his services Salford made a great gain. From several reasons, first of all the death of his wife, and then the extreme pressure of work in consequence of the re-arrangement of the Salford station, his health broke down, and his friends, who knew and appreciated his worth, mourned his early demise. Councillor Irvine seconded the resolution, which was passed in silence, the members of the council standing.

WILLIAM FINLAY, JUN.

We regret to record the sudden death on Wednesday evening, the 7th inst., at the house of his father, Councillor Finlay, at 77 Great King Street, Edinburgh, of Mr. W. Finlay, jun., of the firm of W. Finlay & Co., electrical engineers and contractors, of 27 Frederick Street, Edinburgh. The cause of death was a block on one of the arteries of the brain, which caused heart failure 26 hours after the first symptom. Mr. Finlay was well known in electrical circles in Edinburgh. He was president of the Electrical Contractors' Association last year, and it will be remembered that although in bad health at the time he was able to take the chair during part of the annual meeting of the Association at Edinburgh last June. He was 38 years of age, and leaves a widow and two young children.

ELECTRICAL EXHIBITION AT OLYMPIA, 1911

IT has now been definitely decided to hold an Electrical Exhibition at Olympia, London, from September 23rd to October 21st, 1911. The Exhibition will be promoted by the National Electrical Manufacturers' Association, and arrangements are being made as regards the business management and organisation with International Trade Exhibitions, Ltd. (Broad Street House, E.C.), on similar lines to those which proved so markedly successful in the case of the Manchester Electrical Exhibition, 1908. The preliminary arrangements are nearly complete, and it is hoped that invitations for applications for space will be made in the course of a few weeks.

Electric Railway Exhibition in Russia.—Programmes, &c., in connection with the Electric Railway Exhibition, which is to be held in St. Petersburg, from April to July, 1911, may be seen at the Commercial Intelligence Branch of the Board of Trade, Basinghall Street, London, E.C.

THE WOOLWICH-ELTHAM LINE OF THE L.C.C. TRAMWAYS

A Double Trolley System

THE tramway line from Beresford Square, Woolwich, to Eltham, which was opened for traffic by the London County Council at the end of July, has been obliged to be equipped with an insulated return circuit on account of the risk that earth return currents might cause disturbance of certain instruments at Greenwich Observatory, within three miles of which the major portion of the line is situated. The traffic is not sufficiently dense to warrant the expense of installing the conduit system, so it was decided to equip the line on the double trolley system, with both positive and negative overhead wires for each track.

The total length of the line is five miles of track, and the whole is double track except the loops near the Woolwich end, where the up and down lines follow different routes. A portion of these loops are outside the three-mile radius from the Observatory, so that the ordinary single positive trolley wire and earth return can be used. As we shall see, the cars are equipped so that they can run either on the single or double trolley system, for, in addition to the loops mentioned above, the cars have to traverse a length of single trolley line to the car shed at Abbey Wood. They are also arranged so that plough carriers can easily be added in case of future through running on the conduit lines yet to be constructed from Greenwich to Woolwich, and so that they can be used on any other line on any of the three systems should occasion arise.

At present there is no through running, the cars running only between the Eltham terminus and the Woolwich loop. The overhead construction is considerably simplified by the fact that there are no junctions or crossings, and, indeed, the difficulties that junctions would introduce when two overhead wires of opposite polarity are to be considered would be formidable. The whole construction is span wire with side poles; the same standard fittings are used as in the Council's other overhead work. On the double track portion, as shown in Fig. 1, the four wires, two for each track, are arranged with the negatives together in the centre with no strain insulator between them, but there is the usual double insulation provided by the insulated hangers and globe strain insulators between the positive and negative, and between the outer wires and the posts. The positive and negative wires are everywhere 3 ft. 6 in. apart, and the centres of the pairs over double track are 8 ft. 6 in. apart. The feeding points are, of course, rather more noticeable than usual, owing to the fact that four cables have to be brought up instead of two. There are no special arrangements where the double construction changes to single; the

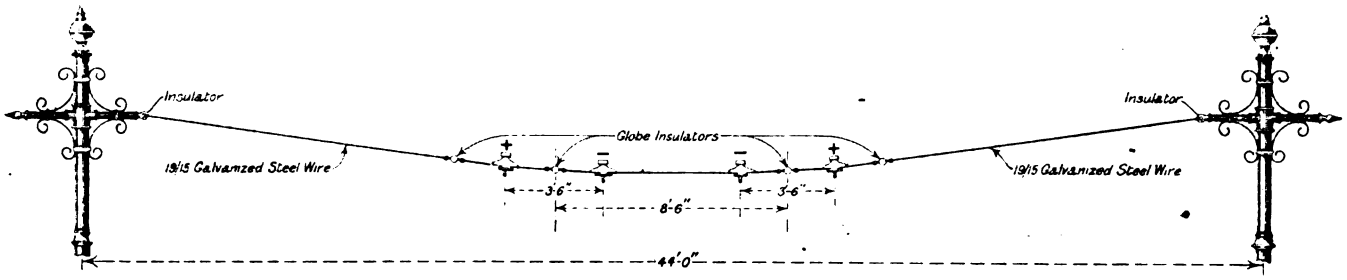

FIG. 1.—ARRANGEMENT OF SPAN WIRES AND INSULATORS ON DOUBLE-TRACK.

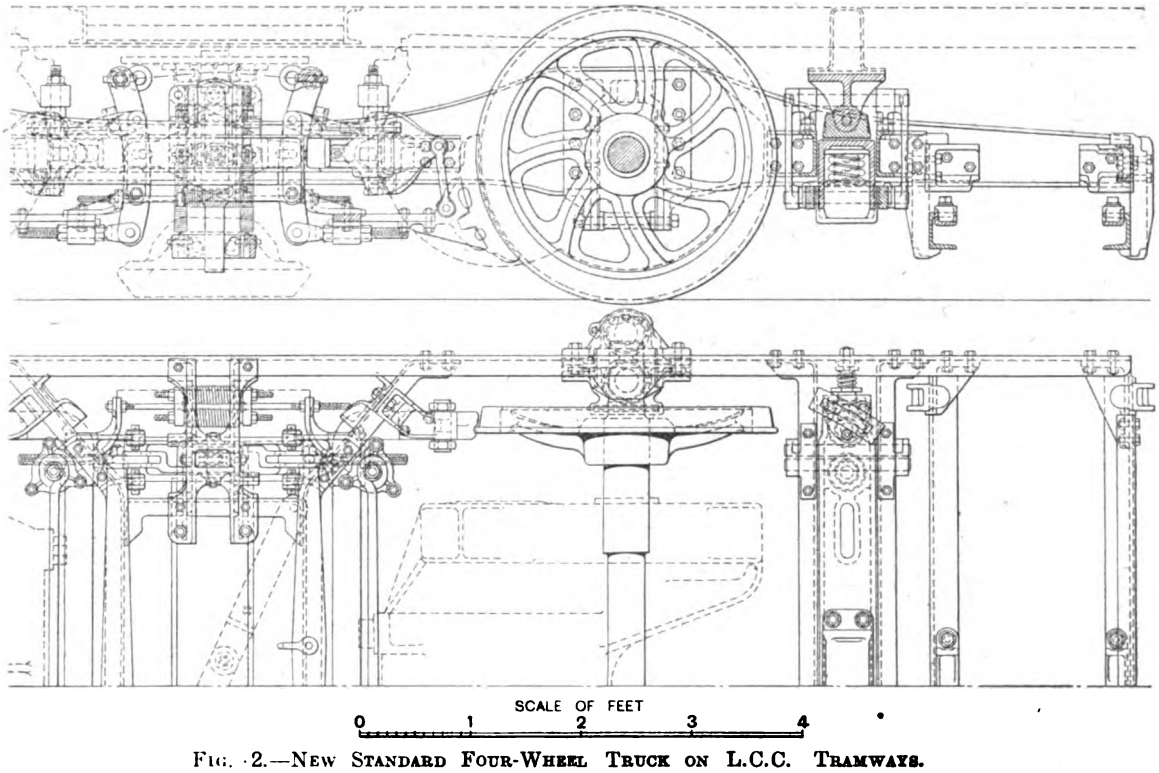

FIG. 2.—NEW STANDARD FOUR-WHEEL TRUCK ON L.C.C. TRAMWAYS.

Digitized by Google

negative wire simply stops, and the positive is brought over the centre of the track. In one place the line passes under a bridge where there is not much clearance, and here the usual inverted wooden troughs are used, and these, at the request of the railway company, are provided with an earthed metal strip at the back, in case of surface leakage.

The cars are all of the four-wheel, rigid truck, double-decked type with top covers, and are interesting as being the first to be put into service with the new pattern of four-wheeled, pressed steel sided truck which the Department have now standardised for all future four-wheeled cars. A drawing of this truck is given in Fig. 2. Its chief peculiarity is that the car body is supported on moving bolsters at each end of exactly the same pattern as those used on bogie cars, and this, with the long wheel base, gives remarkably easy riding, especially on entering curves. It will be

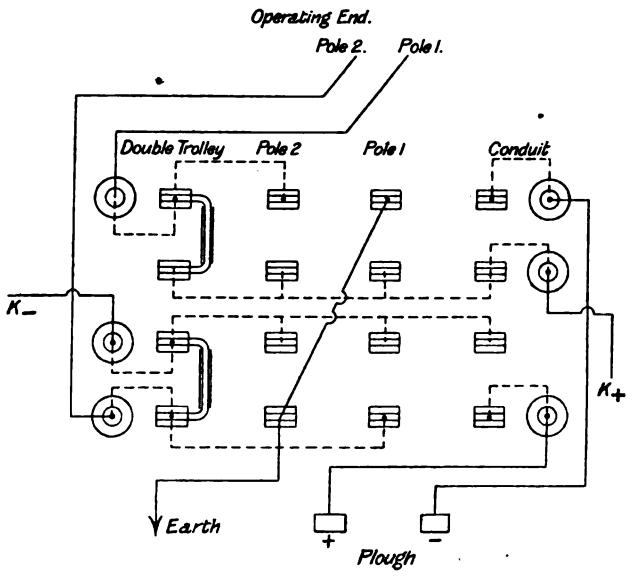

FIG. 3.—DIAGRAM OF CONNECTIONS OF CHANGE-OVER SWITCH.

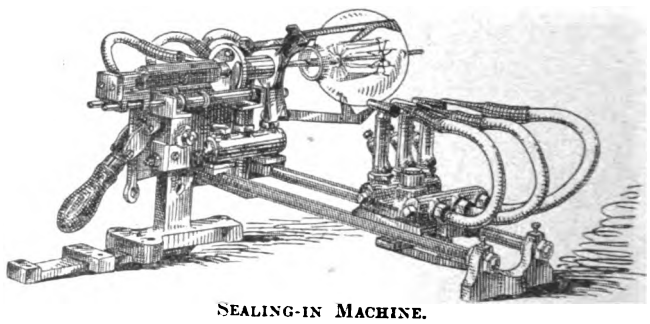

noticed that the brake gear, which is the standard electromagnetic track brake developed by the Council, is in the centre, and that only one shoe on each side is provided instead of two, as on the earlier four-wheeled cars. The space for the plough is at either end instead of in the centre. The whole arrangement is extremely rigid, and has far fewer parts than the older design, and besides giving noticeably better riding, is of distinctly neater appearance. It is interesting to note the extent to which standardisation is carried even in the construction of the bodies. These cars have bodies similar in every detail to the longer bodies on the bogie cars, but with one section, so to speak, omitted, and one window less. Thus all the woodwork, window glasses, fittings, &c., are absolutely interchangeable. It may also be mentioned that on all the cars throughout the system only one size of motor is employed, and, indeed, it is usually found that where the cars are lighter the gradients are heavier, so that about the same power is required.

The trolley poles and bases are absolutely standard, the only difference being that each car carries two side by side. When entering a section where single wire working is practised, all that has to be done is to haul down one trolley pole and put over a special switch, which leaves one or other trolley pole connected, and puts the wheel return connection in circuit. This change-over switch has also another position to provide for conduit working. It is practically the only part of the equipment which has had to be specially designed, and a diagram of connections is given in Fig. 3. The switch itself is of the barrel type, like a small controller, and is placed at one end of the car under the stairway. It is arranged to be actuated by the controller handle, which has to be removed from the controller for the purpose. This ensures stopping the car before switching over, and makes it impossible for it to be put over without knowledge of the driver.

In conclusion, we wish to express our thanks to Mr. A. L. C. Fell (Chief Officer of Tramways to the London County Council), under whose designs the work has been carried out, for putting drawings at our disposal and for other kind help in the preparation of this article.

SEALING-IN MACHINE FOR THE MANUFACTURE OF METAL FILAMENT LAMPS

THE illustration below shows an apparatus introduced by the Foster Arc Lamp & Engineering Co., Ltd. (Morden Road, Wimbledon, London), for effecting the sealing-in of filament carriers into the bulbs of incandescent lamps. It is stated that a few days' practice with this machine enables an unskilled but intelligent worker to make good lamps of the highest finish, and that the risk of filament breakage is reduced to a minimum. The machine consists of a frame with three claws to grip the lamp bulb, and a spindle to hold the filament carrier true and central. An axial extension of the frame rests on two rotating pulleys, which by

SEALING-IN MACHINE.

friction impart a rotary motion to the whole frame. By means of the handle on the left, the frame is lowered so as to bring the friction pulleys into contact with one another, and the lamp bulb into the flame. The small trigger under the handle enables the bulb to be given a horizontal axial movement in and out of the flame. When the frame is lifted again, it operates a valve and automatically lowers the gas. An American blow-pipe with three flames on either side is provided. The two lower pulleys are driven by an endless band (not shown in the illustration) which passes over a shaft under the bench. We understand that this machine is employed in the works of the Foster Arc Lamp & Engineering Co. for the manufacture of their "Foster" metal filament lamps.

Association of Mining Electrical Engineers: Visit to Ferndale Collieries.—The South Wales branch of this institution will visit the collieries of Messrs. D. Davis & Son, Ltd., Tylorstown, Ferndale, on Saturday, September 24th. Members should leave by the following trains: Cardiff, Queen Street, 2.20 p.m.; Newport, G.W.R., 1.34 p.m.; Swansea, High Street, 12 p.m; Pontypridd Junction T.V.R., 2.52 p.m. After the visit, a meeting will be held at the Jubilee Hotel, Tylorstown, Mr. S. F. Walker in the chair. Members desiring to attend should notify their local secretary before September 19th.

Telephones on Trains.—With further reference to the experiments in train telephony described in ELECTRICAL ENGINEERING, August 4th, p. 513, we now learn that the company owning Mr. H. von Kramer's patents, Railophones, Ltd. (21 Wood End Road, Erdington, Birmingham), have definitely contracted to instal the system on the London, Brighton & South Coast Railway's line for a distance of 30 miles in the middle of the route between London and Brighton, and to equip the "Southern Belle" with the necessary apparatus. The equipment is to be complete early next month. The telephone apparatus on the train will consist of a "Peel-Connor" local battery set with a special transmitter, and will be installed in a sound-proof box in the usual way. The inducing coil will be wound on a large horizontal frame suspended from the carriage, and two insulated live wires will be laid along the two rails for a distance of 30 miles. We understand that Railophones, Ltd., are negotiating with other railway companies in England and Scotland with a view to installing further equipments.

THE LEPEL SYSTEM OF WIRELESS TELEGRAPHY

THROUGH the courtesy of Baron von Lepel, we were enabled recently to inspect the wireless station which has been erected at Slough for experimental purposes by the Anglo-German Wireless Syndicate, Ltd. (1 Cecil Chambers (West), Strand, London, W.C.), the new company owning the rights of the Lepel patents. At the same time Baron von Lepel kindly explained the latest developments of his system, and also gave us particulars of the commercial station recently installed in Jamaica for the Direct West Indian Cable Co.

The Lepel system has already been described in an article by Mr. C. C. F. Monckton in ELECTRICAL ENGINEERING, May 13th, 1909, p. 434. Fig. 1 illustrates the latest arrangements. The discharger, *A*, comprising two metal discs separated by a ring of thin paper, and provided with water-cooling, is connected through choking coils, *G*, direct to a direct-current supply at about 500 volts. The positive disc of the discharger is of copper, and the negative, delta metal. A resistance, *R*, is provided, and the switch, *S*, is the sending-key. Although this key is in the primary circuit, and breaks from 2 to 5 kw. at 500 volts, D.C., destructive sparking or arcing is prevented by means of a delicately adjusted resistance and condenser connected across the contacts. A condenser, *B*, and the two-turn primary, *C*, of the Tesla transformer complete the oscillation circuit. In parallel with the discharger are sometimes a second inductance, *H*, and a variable capacity, *F*, the function of which will be explained later. These, however, are not necessary for ordinary work. The spark rate is from 10,000 to 30,000 per second. The formation of an arc is prevented by the rapid cooling of the gap, due to the continual travelling of the spark all over the surfaces of the electrodes, and the water-cooling. Oscillatory currents rising up to 60 amperes are produced in the primary circuit, and these are transformed up in the coil, *D*, of the transformer, which is connected with the antenna as shown.

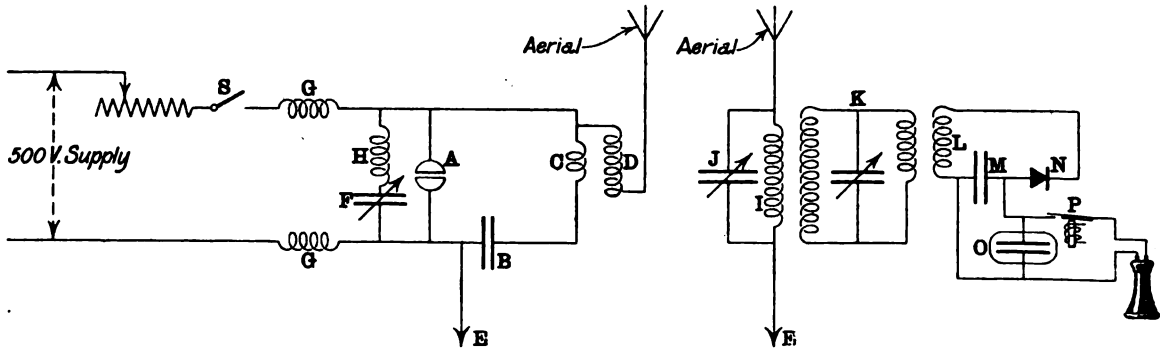

FIG. 1.—DIAGRAM OF CONNECTIONS FOR TRANSMITTING AND RECEIVING CIRCUITS.

Whereas the primary circuit is very highly damped owing to the rapid cooling of the gap, the secondary circuit is only very slightly damped, in spite of very close coupling with the primary, since the quenched spark enables the secondary to swing freely after each excitation from the primary circuit, and give out a continuous train of pure waves of one period only.

The receiving circuit comprises the antenna oscillating circuit, *I*, *J*, an intermediate tuning circuit, *K*, and the detector circuit. A graphite galena thermo-electric detector is employed, and the diagram of Fig. 1 shows this in use with a recently devised integrating device for producing loud signals. A gold-wire interrupter, *P*, operated in the same manner as an ordinary electric trembler or bell, alternately opens and closes the telephone circuit. In parallel with the telephone and the interrupter is an electrolytic condenser, *O*, of 5-mf. capacity, and this stores up the feeble continuous current from the detector and discharges through the telephone every time the interrupter closes the circuit. The "note" heard is there-

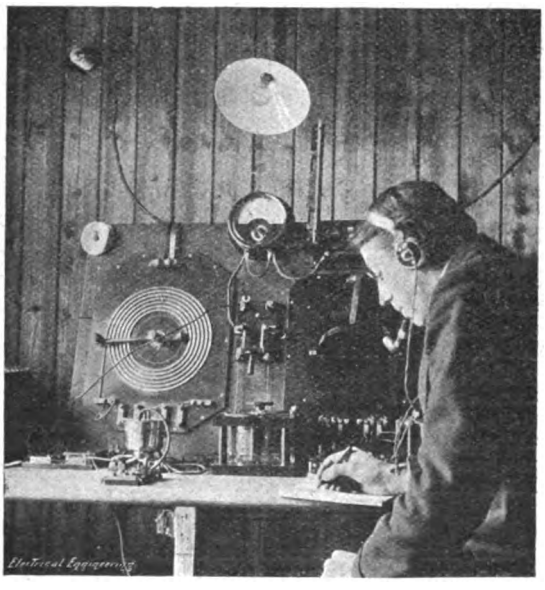

FIG. 2.—INTERIOR OF SLOUGH STATION.

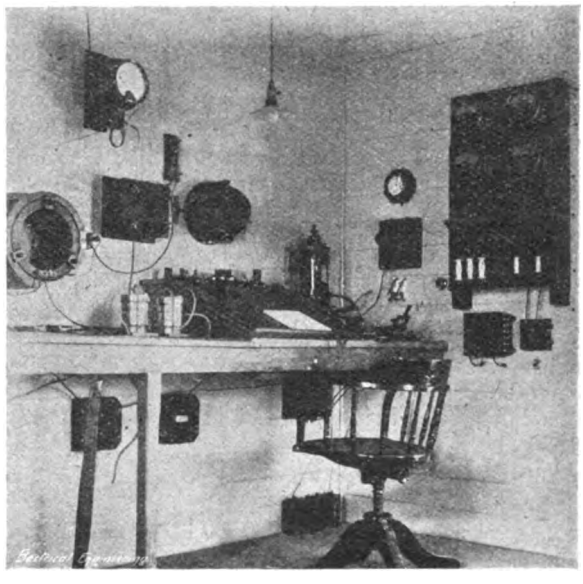

FIG. 3.—INTERIOR OF JAMAICA STATION.

Digitized by Google

fore not the high note of the transmitter, but the "buzz" of the interrupter. Where the signals are sufficiently distinct to be heard without the integrator, the musical note of the spark is heard.

An interesting recent addition to the system is a means of instantly altering the "note" of the transmitter over a wide range, thus allowing simple tunes or bugle calls to be transmitted. The auxiliary inductance, H, and the variable capacity, F, shunted across the discharger and already referred to are used for this purpose. This capacity, F, consists of eight condensers connected in parallel with eight corresponding keys so interconnected that the second key puts in two condensers, the third key three, and so on. The result of thus connecting an oscillatory circuit of a different period in shunt with the discharger circuit is to cause the successive amplitudes of the primary wave train to alternately swell and diminish with a period equal to that of the auxiliary oscillatory circuit. As the period of the primary oscillations is made higher than that of the highest note audible, the periodic surgings caused by the auxiliary circuit produce a pure musical note. Eight different notes can be obtained in quick succession by depressing the keys, and the octave can be varied by altering the inductance. In this manner tunes are played at the transmitting station, and we had the pleasure of listening with a portable receiving set to a variety of well-known melodies played at the Slough station. For receiving musical notes, the electrolytic capacity in the detector circuit is removed and the interrupter short-circuited.

Fig. 2 shows Mr. B. Binyon, the engineer, at the Slough experimental station receiving a message This station can communicate with Paris and Brussels with its 2-kw. continuous-current equipment. For communication with Brunswick, Germany, a 5-kw. equipment utilising alternating current at 1,500 volts, 300 cycles per second, and a discharger consisting of six Lepel gaps in series, is employed. The aerial mast is 212 ft. high.

The station at Jamaica has two masts, 160 and 120 ft. high respectively, placed 260 ft. apart. The antenna is of the inverted "L" type, arranged to be slightly directive in a north-easterly direction. The generating plant consists of gas-engine sets, and the power employed in transmission is from 2·5 to 3 kw. The interior of the operating room is illustrated in Fig. 3. To the left of the desk can be seen the two single-gap dischargers connected in series, and still further to the left is the oscillation transformer. A regular commercial service is carried on with ships up to 900 miles, but communication has been successfully established with New York harbour, a distance of over 1,500 miles. The station is in frequent communication with the shore stations at Colon (600 miles), Santiago-de-Cuba, and Guantanamo, the two latter stations being in Cuba, some 200 miles distant.

New Electrically-driven Cotton Mill.—A large cotton mill especially designed for electric drive is being erected in Yorkshire. Messrs. Wright & Wood, Ltd. (Century Works, Halifax), who have secured the contract for the motors, have sent us the following particulars of the equipment:—Power to the amount of some 1,000 h.p. will be obtained from the three-phase distribution system of the Yorkshire Electric Power Co. Fifty 15-h.p. 400-volt three-phase motors running at 970 r.p.m. will be installed. These will be of the squirrel-cage type, with delta-wound stators, and will each have a three-pole oil switch fixed to the top of the shell. Each motor will drive a single ring-frame through a clutch, and will be started up by switching direct on to the supply. They are designed to take from five to six times the full load current momentarily at starting. When the full speed is reached the clutch will be thrown in by the operator. Separate cables are run from a plug near each motor to the main switchboard, so that each motor can be separately metered if necessary. We understand that seven or eight manufacturers were invited to submit sample machines to the specifications of the consulting engineer, and that these were tested for efficiency, power factor, temperature rise, starting torque, etc., before placing the order.

ELECTRICAL APPLIANCES IN DENTISTRY

THE Dental Exhibition, held last week at the Royal Horticultural Hall, was a striking testimony to the manner in which electrical appliances are becoming essential adjuncts to the equipment of dental surgeries. A large variety of "electric engines" were to be seen, a favourite pattern being that in which the motor, enclosed in a metal sphere, is suspended by a heavy flexible cable with a counterweight over pulleys fixed to a long wall bracket. The power is transmitted to the tool by a rotary flexible steel cable or a cord and pulley drive. A neat foot-controller for reversing and varying the speed of the motor, and provided with foot levers at opposite diameters so as to be readily operated from either side of the chair, is provided. All the electric lathe motors exhibited appeared to be of American make, the usual size being ⅛ h.p. at from 1,000 to 3,000 r.p.m. Two or three patterns of electric furnaces for the firing of enamels and gum bodies, and the baking of in-lays, were represented. These consist of a small muffle from one to three inches wide, and of about equal depth, wound externally with resistance wire. Electrical pyrometers are used for ensuring the right temperature being employed. Various designs of electric dental projectors were exhibited, including adaptations of the "Telschow" and the "Dunn" lamp, which throws light on to the instrument table as well as concentrating a beam on to the patient's mouth. Hand-mirrors with a bull's-eye lamp let into the mirror for enabling patients to inspect the work, and improved mouth lamps for the inspection of cavities, were also shown.

A number of appliances already described in these columns were to be seen adapted to the special requirements of dental work. Such were the "Fuller" geysers fitted to fountain spittoons, "Prometheus" water heaters adapted as instrument sterilising tanks, electric hot-water jugs, kettles, foot-warmers, compo heaters, &c. Electrically heated instrument tables for keeping the instruments warm, and thus avoiding the shock to the patient of the cold metal, electric annealers for annealing gold plates, &c., and various patterns of cautery instruments were also to be seen. An interesting novelty was a root dryer comprising a long silver point, hollow at its thick end, and containing an electric heating spiral. This instrument is inserted into root canals for drying and sterilising the tissues. Several compressed air plants for use with atomisers and hot air syringes were exhibited. A small motor-driven compressor is employed in conjunction with an air reservoir, and an automatic device which starts the compresser directly the pressure falls below 40 lbs. per sq. in., and stops it when the pressure reaches 80 lbs. The air is used for atomising antiseptic or anæsthetic solutions with which to spray the mouth, and to remove foreign matter from cavities. The hot-air syringe consists of a small spiral heater supplied with current at 4 volts, and enclosed in a glass cylinder through which the compressed air is forced. It is constructed with an air space between the heating cylinder and the outer perforated sheet, so as to prevent the external parts getting hot. A nozzle fine enough to enter a nerve canal is provided. The switch is fixed on the instrument and the air valve is opened on switching on the current. This instrument is used for relieving pain and drying cavities and root canals.

Most of the above instruments and apparatus were exhibited by The Dental Manufacturing Co., Ltd., who showed some fine examples of surgery switchboards. Messrs. Claudius Ash, Sons & Co., Ltd., had an extensive exhibit of electrical apparatus, and other firms showing electrical appliances were Arnold Biber, Cottrell & Co., and the Midland Dental Manufacturing Co., Ltd.

Battery Exit Lamps for Theatres.—According to the *Electrical World* (New York) an arrangement of exit lamps has been adopted at the Olympic Theatre, Chicago, in which each lamp is lighted from its own set of independent storage cells. The cells are, however, connected to a series circuit, so that they can be charged when required from the ordinary supply. Each exit sign contains a second lamp, which is switched in automatically if the filament of the first fails.

Interpole Tramway Motors.—As the result of a circular letter sent out by the Verein Deutscher Strassenbahn-und Kleinbahn Verwaltungen to tramway and light railway engineers, some 28 undertakings reported having carried out experiments with interpole motors. Four undertakings which only recently commenced working have adopted interpole motors exclusively. The reports show that the chief advantage in their use is the absence of sparking, and the consequent lessened attention to the commutators and longer life of both commutators and brushes.

ELECTRICITY v. GAS FOR STREET LIGHTING

IN view of the attention that has been drawn in various quarters to the activities of the gas interests in the competition between electricity and gas for street lighting in London, the Electrical Supply Publicity Committee are sending the following letter to all the principal papers throughout the country, in the interest of supply undertakers generally, and in response to numerous inquiries received by the Committee.

[COPY.]

LIGHTING OF LONDON.

A most misleading impression has recently been created by certain paragraphs appearing in the Press under the above heading. The impression given was that London, instead of continuing an electrically-lighted city, as at present, was about to revert to gas. I need hardly say that nothing is further from the truth. The case, however, presents an interesting example of how easily an erroneous impression can be set afloat. The facts are as follows:—One of the twenty-nine London authorities, influenced by conditions which were purely local, decided to alter a few of their numerous electric lamps to gas lighting. The number of the lamps involved is quite small compared with the total number of lamps in the borough in question, and is altogether negligible in comparison with the total electric lighting of London. The whole case, in fact, is simply a local matter, confined to one authority only, and is quite undeserving of this wide publicity were it not for these incorrect rumours which have given rise to so much misunderstanding. For corroboration of the facts, reference need only be made to the official statistics of the London County Council, where it will be seen that the use of electric street lighting has more than doubled in half a dozen years, and that only ten out of the twenty-nine London authorities are wholly without electric street lighting. As to the relative cost of electricity *versus* gas for street lighting, I need only mention that in St. Marylebone the saving effected last year was £1,500 in respect of a portion of their area only, and that this has encouraged them to convert the whole of the remaining gas lamps to electric light, which will bring the saving up to £2,600 per annum. Further, the boroughs of Hampstead and Shoreditch—already extensively electrically lighted—are extending electric lamps practically throughout the whole of their areas.

Thanking you for your courtesy in giving publicity to these facts,

I am, your truly,

H. B. RENWICK,
Chairman of the Electric Supply Publicity Committee.

Full particulars of the methods which are being adopted in Marylebone, Hampstead, and Shoreditch were given in an illustrated article on page 547 of ELECTRICAL ENGINEERING of August 25th.

BOGUS TRAMWAY ACCIDENTS

AT the Old Bailey, on September 9th, three men, named Weller, Smith, and Hodder, were sentenced to six, four, and one month imprisonment respectively with hard labour for making compensation claims for bogus tramway and other accidents. The prosecution was at the instance of the British Electrical Federation. The prisoners were part of a gang which has been perpetrating these fraudulent claims for the past five or six years. The leader, Weller, has a permanent injury to his right wrist, and with this asset has been able to obtain considerable sums of money from tramway companies, insurance companies, and others.

So far as the tramway companies' claims are concerned, Weller's method was to board a car and, after allowing the other passengers to alight, on the car reaching its destination, to break away a piece of the wood slatting or beading which is nailed across the top deck, and then to pretend to fall. Having informed the conductor that he had met with an accident through falling over the defective slatting, his name and address would be taken, and in due time his claim would be received for compensation. In the meantime, he would go to a hospital, and obtain from the hall porter a form recording the injury. Weller also arranged with the other prisoners to give their names and addresses as his own, and before the company on whom he claimed sent their representative to interview the claimants, Weller had bandaged their right arms in correct hospital fashion and provided them with the hospital form. As the sum claimed was usually small, varying from £2 to £15, it was an easy matter for the frauds to be successful. In the case of the Metropolitan Tramway Co. they had a report from the conductor of the car, and also a detailed report from an inspector who happened to be on the car at the time of the alleged accident, and the company's representative saw the prisoner Hodder bandaged up. The whole case appeared to be genuine, and a prompt settlement was made in order to avoid legal proceedings.

The fraud was discovered in the following manner:—Weller, writing in the name of Smith, informed the Metropolitan Tramways that he had met with an accident and intimated a claim for compensation. A report had in the meantime been received from the conductor of the tramcar, and these documents were forwarded to the department which deals with all the claims received by the companies belonging to the British Electrical Federation, who have a mutual accident fund. In response to a letter, Weller called at the Federation offices and was interrogated about the accident; he produced the hospital form describing his injury, and it was then noticed that the date had been altered. He was told to come back again, and in the meantime inquiries were made which proved that the certificate had been issued previous to its date, and had been used in connection with another bogus accident. When Weller appeared at the Federation offices the next day he was arrested, and on being searched documents were found in his possession which led to the arrest of Hodder and Smith.

CORRESPONDENCE

THE PRICE OF ELECTRICITY.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Will you allow me to correct an evident misunderstanding occurring in your report of my paper at the B.A. meeting?

Your account says "apparently, therefore, his ideal system would be to supply electricity for power and heating at this price, and to increase the price for lighting sufficiently, &c."

Correctly put, my ideal is "to supply electricity for power and heating at prices which are not unnecessarily restricted by an assumed cost of supplying electricity for these purposes, which separate cost is, as I have tried to demonstrate in the paper, unascertainable; but to offer the supply at prices which are profitable having regard to their effect upon the relation of mean price to mean cost, and then to apply the increased profit to *decreasing*—not increasing (as you put it)—the price to other consumers, or in such a way as may result in the greatest benefit to the undertaking considered as a whole."

Your comment shows that the writer of it is influenced by the misunderstanding which it was the main object of my paper to dispel.

I am, Sir, yours, &c.,

4 Queen Victoria Street, E.C. E. W. COWAN.
September 12th, 1910.

The Association of Consulting Engineers.—Will the "old subscriber" who has written us on this subject over the signature of "Anon" kindly send us his name and address?

New Sub-Stations and Extensions for the Newcastle and Durham Electric Supply Co.'s Systems.—Owing to the increasing demand for electric power at Messrs. R. & W. Hawthorn Leslie & Co.'s engineering works at Walker, the sub-station of the Newcastle-upon-Tyne Electric Supply Co. at Walker has been extended. It now consists of three transformer chambers 29 ft. by 21 ft. by 14 ft. high. This sub-station is built inside a larger building and is for reducing the pressure from 5,500 volts to 440 volts. The total capacity is now 2,000 h.p., there being three 700 h.p. oil-cooled transformers. The high-tension switchgear is of the Brown, Boveri "Grid" type, supplied by Messrs. Richardsons, Westgarth & Co., Ltd., and consists of two feeder panels, each of 2,500 kw. rated capacity, and three transformer panels each of 1,000 kw. capacity, while one extension panel is allowed for. The low-tension switchgear is of the Reyrolle "Ironclad" type, with three transformer panels each of 1,000 kw. capacity. There is also a small 30-volt battery used for the tripping coils of the protective gear. The new installation was put into service on August 17th. To cope with the demand for light and power at the Co-operative Stores, at Seaton Delaval, the Newcastle-upon-Tyne Electric Supply Co. has just ordered a new sub-station of 150 h.p. capacity. The power will be transmitted from the Carville generating station by means of the main pole line of the Company running north, the feeder to the sub-station being taken off the pole line serving the East Holywell and Seghill Collieries. The switchgear will be of the Reyrolle "Ironclad" type. Another interesting installation is that being made by the County of Durham Electric Power Distribution Co., Ltd., for the Silksworth Co-operative Society. The sub-station is being built inside an existing building. The power comes overhead from Carville, at a pressure of 20,000 volts, as far as Ryhope, where it is transformed down to 2,750 volts and transmitted by underground cable to Silksworth. Here it is transformed down to 440 volts.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 8th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

18,675/09. **Motor Control.** M. T. MEDWAY and M. D. SCOTT (Purley). This specification describes a system of control for motors, the object of which is to render it impossible to reverse the armature current until the motor has come to rest. This is effected by a solenoid supplied with current by the motor when rotating by momentum, and acting as a dynamo after the main circuit has been broken, which holds open the main switch. When the armature comes to rest it no longer generates, and the solenoid permits the closing of the switch. One figure.

18,954/09. **Lamp Filaments.** H. W. LAKE (*Parker-Clarke Electric Co., U.S.A.*) This specification covers a strong filament which can be used at a very high temperature as a lighting or heating body in the open air. A core or filament of carbon is flashed in a vessel containing a mixture of hydrogen and benzol and silicon tetrachloride. The gases are decomposed, and the filament is covered with a skin of silicon-dicarbide (SiC_2). Any desired thickness of skin may be formed. Such filaments are said to incandesce in the open air without oxidising.

19,037/09. **Reflectors.** S. O. COWPER-COLES (London). Parabolic and other reflectors for searchlights, motor lamps, etc., are prepared by depositing a film of gold on a glass surface. A backing of silver is deposited over the gold to protect it. By regulating the thickness of the gold film, a variety of shades are obtained, and the light does not dazzle.

20,067/09. **Conduit Junction Boxes.** R. BUTLER and A. H. GIBBINGS (Liverpool). Junction boxes, elbows, etc., for metal conduit are constructed in two halves connected by screws, and have at the necks outwardly tapering recesses into which the flayed out ends of the conduit fit tightly. When the box or elbow is screwed up the conduit is held rigid and cannot move longitudinally. Two figures.

29,068/09. **Arc Lamp.** H. HIRST and A. E. ANGOLD (General Electric Co.). This is a flame arc lamp with two converging flame carbons, one of which rests on another short, hard carbon. The arc is normally struck between the two upper electrodes, but the supporting carbon is slowly consumed by the heat due to the arc, and is fed upwards by lever mechanism to keep the arc in the same position. The unsupported carbon is mechanically connected with the supported carbon, and feeds down at the same rate by gravity. This specification covers the lever mechanism acting on the supporting or abutment carbon, and operated by side pressure from the carbon holder as the carbon feeds down. Two figures.

5,985/10. **Induction Motor.** W. I. SMITH, J. D. GREEN, and A. W. GLOVER (Leeds). The rotor is built upon a sleeve and can rotate round the shaft. One plate of a cone friction clutch is attached to one end-plate of the rotor or itself forms an end-plate, and the other plate is mounted so as to rotate with the shaft but to slide axially along it. The two plates are normally pressed into contact by a helical spring on the shaft, but are held apart by means of a lever when the motor is started up. On the rotor attaining full speed, the lever is gradually released. One figure.

6,667/10. **Meter.** BRITISH THOMSON-HOUSTON CO. and C. R. D'ARCY. In meters of the induction type, the magnet system is constructed with an E-shaped potential core connected to the U-shaped current core at a point below the current coils, so as to avoid the use of the meter casing as a path for that part of the potential flux which does not cut the driving disc. Two figures.

7,821/10. **Searchlights.** SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens-Schuckertwerke Ges.*). For heavy current arc lamps, a permanently excited electric motor is geared to the electrode holders and is controlled by relays, so that it varies the position of the carbons according to the condition of the arc. The motor armature is short-circuited when the arc is normal. A main relay switch actuates one of two auxiliary relays which starts up the motor in the required direction. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: SCHUER, 13,728/09; MOUNT AND BECK FLAME LAMP, LTD., 19,387/09; MCBRIDE, 28,555/09; SIEMENS-SCHUCKERTWERKE GES. [Searchlights] 8,411/10.

Dynamos, Motors, Transformers: BAMBRIDGE [Driving mechanism for motors] 19,496/09; BARBOUR [Homopolar machines] 21,179/09; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*) [Prevention of sparking in frequency transformers] 23,291/09; FYNN [A.-C. motors] 30,208/09; W. A. STEVENS, LTD., and LAMBERT [Brush-holders] 30,331/09; FELTEN & GUILLEAUME-LAHMEYERWERKE A.-G. and COLLISCHONN [Petrol-electric driving mechanism] 4,681/10; SIEMENS BROS. DYNAMO WORKS and LYDALL (*Siemens-Schuckertwerke Ges.*) [A.-C. commutator motors] 7,266/10; A.-G. BROWN, BOVERI & CIE. [Train lighting dynamo] 13,502/10.

Electric Ignition: HIGGS, 28,453/09; BATT, 28,818/09; ALLISON (*Noyes*) [Magneto] 14,315/10.

Electrometallurgy and Electrochemistry: MULACEK and HATLANEK [Induction smelting furnaces] 672/10.

Storage Batteries: HUBBELL, 29,240/09.

Switchgear, Fuses and Fittings: BRACKENSIECK [Automatic sign switch] 16,885/09; KIRWAN and QUANEY [Circuit-breakers] 21,343/09 and 26,088/09; HOSGOOD [Plug and socket] 25,719/09; BENJAMIN [Lamp fittings] 27,208/09; DICKER (*Benjamin Electric Manufacturing Co.*) [Portable lamps] 3,977/10; ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Motor controllers] 6,867/10; PODSZUS [Vapour apparatus] 14,857/10.

Telephony and Telegraphy: GRAHAM [Signalling] 23,747/09; SIEMENS BROS. & Co. and DIESELHORST [Pupin coils for submarine cables] 26,250/09; SIEMENS & HALSKE A.-G. [Semi-automatic telephone exchanges] 6,964/10; GRAHAM [Telephone transmitters] 8,024/10 and [Telephone systems] 10,577/10; FESSENDEN [Variable transformers] 11,903/10.

Traction: HARDINGHAM (*Le Feuvre*) [Vacuum brakes] 5,379/10.

Miscellaneous: ECKERSLEY and CRESWICK [Coal-cutters] 22,432/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Refractory insulating materials] 23,351/09; WILLIAMS [Coal-cutters] 26,299/09; BAMBERGER [Electric organ mechanism] 27,175/09; FALK [Electric clocks] 27,355/09; HURD [Coal-cutters] 4,491/10; CLARKE, CHAPMAN & Co. and COOKSON [Brake mechanism for hoisting machinery] 6,349/10; REINEKING [Short-circuit detectors] 7,322/10; KLEIN [Electrical warp stop-motions for looms] 11,761/10; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*) [Vacuum cleaning apparatus] 11,901/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Incandescent Lamps: ARSEM [Filaments] 19,030/10; A.E.G. UNION ELEKTRICITÄTS-GES. [Manufacture of tungsten filaments] 19,095/10.

Instruments, &c.: DUNOYER [Measurement of intensity and variations of magnetic fields] 17,624/10.

The following amended Specification can now be obtained.

HIBBERD [Prepayment meters] 8,438/08.

Opposition to Grant of Patents

25,231-2/07. **Exhaust Steam Accumulators.** J. HOWDEN & Co., LTD., and W. H. OWEN. An appeal has been lodged against the decision of the Comptroller to grant these patents. (See ELECTRICAL ENGINEERING, Sept. 1st, 1910, p. 564.)

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

20,505, of September 16th, 1896. **Storage Battery Plates.** H. IMRAY (*R. J. Grindle, Dieppe*). In plates comprising several ridged strips of lead rolled up and held in a frame, the strips have a central longitudinal ridge to improve the conductivity.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: H. E. ANGOLD, A. W. HILL, and SIR HIRAM MAXIM ELECTRICAL & ENGINEERING CO. [Enclosed lamp] 12,101/03.

Distribution Systems, &c.: E. S. MOORE and W. G. STRANG [Booster connections] 10,639/05.

Dynamos, &c.: H. LAKE (*General Electric Co., U.S.A.*) [Insulation of H.-T. transformer coils] 11,851/02, and [Turbo-alternator rotor construction] 12,080/02; L. KRIÉGER and COMPAGNIE PARISIENNE DES VOITURES ELECTRIQUES (Procédés Kriéger) [Dynamo-motor combinations for electric cars] 25,171-2/05.

Electrometallurgy, &c.: E. STASSANO [Electric furnace and iron alloys] 11,604/98; S. O. COWPER-COLES [Electrodeposition apparatus] 9,731/00; M. OTTO [Ozone sterilizer] 11,928/04; D. FULLER [Dry cell] 11,040/05.

Incandescent Lamps: D. J. O'BRIEN [Straight filament lamp] 11,439/04.

Storage Batteries: C. GOULD [Machine for grooving plates] 11,070/99.

Switchgear, &c.: M. A. CODD [Cable connectors] 11,012/05.

Traction: G. GIBBS [Motor trucks] 9,413/00.

Miscellaneous: D. ABERCROMBIE [Lamp for rifle] 11,700/04; D. D. PLUNKET [Coal conveyor] 11,877/04; A. J. BOULT (*Cöln-Müssner Bergwerks Akt.-Verein*) [Use of arc in manufacture of metal ware] 10,655/05.

WHAT IS "ASSOCIATION" CABLE?

THE Cable Makers' Association have published in the advertisement columns of a few technical papers a full-size reproduction of their label, with a notice to warn buyers of "Association Grade" cable to see that they get it. In an interview with the Secretary of the Association, we were informed that the advertisement is actually published to protect the Association against imitation of their label, and that particular importance has been attached to the announcement appearing in the journals read by architects, as the wiring contractors already know of the existence of the Association.

The label, which is probably known to the majority of our readers, or at any rate to that portion of them who have to do with house wiring, is buff coloured, and measures about $5\frac{3}{4}$ ins. long by $3\frac{3}{8}$ ins. wide. It bears the words "Association Cable, made in accordance with the standards of the Cable Makers' Association, of which we are members," with spaces for the guaranteed insulation resistance, the length, size, "megohm" grade, and class, and the name of the maker. The Secretary of the Association did not respond to our request for information as to whether it was the label of any particular non-Association firm that had called for the issue of this notice. We do not remember having met any inferior cable labelled to pass off as C.M.A. material, but we must admit that there are many makes of foreign cable that do not come under our observation in ordinary circumstances. A British maker outside the Association supplies a cable with a pink label marked "C.M.X. Made in accordance with the Standards of the Cable Makers' Association and Engineering Standard Committee," but in this case we are convinced that there is no desire to pass off as an Association firm, and the samples of the cable in question which we have seen appear to be, at all events as good as, if not better than, samples of C.M.A. cable of the same "megohm grade."

We cannot but think that the Cable Makers' Association would be well advised to be less reticent than they are as to the actual quality of cable to which the magic word "Association" is attached, and also if they advertised a list of those makers who form the Association, and a list (possibly a shorter one), of those who do not make any other vulcanised rubber cable than "Association Cable." Of greater utility still to the expert buyer and user, however, would be a clear statement indicating the quality of this "Association" cable, and the specification to which it is made. The consulting engineer or contractor has, it is true, a sort of implied guarantee that the "Association" cable made by all its members is of equal quality, but he has no guarantee that the cable he buys as "Association" cable to-day contains the same proportion of Para rubber as that which he bought a year or five years ago. The Association, so the Secretary informs us, adheres at present to its policy of not disclosing its specifications of V.R. cables. To those buyers who cannot themselves form an idea of the quality of cable from an inspection of it and particulars of the tests, our advice is to buy "Association" cable, as the reputation of the Association firms is good, or, if he is buying from a non-Association firm, at any rate to limit his custom to firms of equally high repute, and to exact a guarantee. The expert buyer, however, can hardly be blamed if he objects to adopting a standard without knowing what that standard is; and if he is forced to frame his own standard specification, or to buy from submitted samples, he will naturally desire to reap the advantage in price which an open market affords.

CORRESPONDENCE on this subject is invited.

SURFACE-CONTACT TRACTION CONDEMNED

Board of Trade Refuse to License Dolter and G.B. Systems

THE dispute between the Torquay Corporation and the Torquay Tramways Co. as to the practicability of making the Dolter surface-contact system a workable one in Torquay, reached an important stage on Monday, when arbitration proceedings in connection with the matter were commenced in London. The Board of Trade have definitely refused to renew the licence for the Dolter system on the nine miles of track in Torquay, and, acting under advice, the Company have given orders for converting all the lines to the overhead system, except the ones in Torbay Road, in respect of which a special clause applies. The Board of Trade have approved the plans of the overhead construction, without prejudice to any legal questions that may be raised with regard to the proposed change. The Company's original Act of Parliament was obtained in 1904, and various lengths of line have been opened at intervals since.

At the outset of the arbitration proceedings, the Corporation protested against any arbitration at all, on the ground that, by virtue of section 58 of the Act, and a subsequent agreement, they had an absolute veto in regard to the system to be adopted in the Torbay Road. After consideration, the arbitrator (Mr. Archibald Reed, Barrister) decided to proceed with the hearing, leaving it to the Corporation to apply to the Courts on this point of law when his award is issued.

The chief technical witnesses are Mr. W. M. Mordey for the Corporation, and Mr. James Swinburne and Mr. W. H. Patchell for the Company.

Mr. VESEY KNOX, K.C., in opening the case for the Company, expressed his conviction that surface-contact traction is hopeless, and that not one installation had been really commercially successful. At Torquay the Company was now working at an absolute loss, and he hinted that it seemed to be the intention of the Corporation to keep the Company in this position in order that they might be able to by them out at a nominal figure, the Corporation having powers under the Act to purchase on "going concern" terms. The Board of Trade had informed the Company that they would not sanction the G.B. system. With regard to another alternative, the Mitchell improved stud, he said that Mr. Mitchell, who was formerly Chief Engineer to the National Electric Construction Co., had invented five previous studs, all of which had proved quite unsatisfactory. The Lorain Co. had refused to guarantee their system, and in the opinion of the Company, therefore, all three alternatives were impracticable. The Dolter system had been installed at Mexboro, Hastings, and Torquay. At Mexboro it was taken out at the request of the Councils concerned, and at the suggestion of the Board of Trade, and the overhead system was substituted, with the result that the units per car mile had decreased from 2·3 to 1·7, the cost of maintenance from 3d. to 1d. per car mile, and the average revenue per car mile had increased from 7½d. to 10d. At Hastings, he said, although two miles of lines are worked along the front fairly successfully owing to the particular local conditions, *i.e.*, a wide road with the line running on one side and no gradients or curves, the cost of maintenance is double that of the rest of the line, which is worked on the overhead system. After mentioning the fact that the National Electric Construction Co., as the parent company of the Torquay Co., has spent £30,000 on inventions of Mr. Mitchell, Mr. Knox protested against having to spend a further £6,000 upon fitting the Torquay track with this newest stud of Mr. Mitchell. To convert the lines to the overhead system, and to construct the extension to Paignton, will cost £80,000, and this sum the Company are able to find; but no responsible financier, said Mr. Knox, would find any money if the surface-contact system remains on any section of the system.

Some of the defects of the Dolter system, carbonisation of the oil, water getting inside, and explosions due to accumulations of gas in boxes, were specially mentioned. Dead studs, as well as live studs, were common experiences, and, said counsel, it is not uncommon for the motorman and conductor to have to crowbar a car from a dead to a live stud. One run showed 63 extinctions of the lights on a mile of line, owing to dead studs. At the commencement of working, no fewer than 37 men were engaged in looking after the track. The consumption of energy per car mile was 0·26 unit more than the total consumption metered on the cars, and this was attributed to leakages in the system generally which cannot be detected.

Criticising Mr. Mordey's report (ELECTRICAL ENGINEERING, July 28th, p. 496), and also his reports upon the G.B. system in London, Counsel said that Mr. Mordey's was a type of electrical mind which was the terror of capitalists, suggesting

Digitized by Google

all sorts of possibilities which, in fact, always had great practical difficulties.

The position of the Company was demonstrated by the following figures: In 1908 the gross revenue was £15,000 and the net revenue only about £3,000. In 1909, although the gross revenue went up to £15,545, the net revenue decreased to £2,426, and it seemed to be only a question of time for the net revenue to disappear altogether, owing to the heavy cost of maintenance of the Dolter system. These figures allowed nothing for depreciation or reserve.

Mr. W. B. COWNIE, General Manager of the National Electric Construction Co., and a director of the Torquay Tramways Co., gave further instances of the difficulties which had been encountered in connection with the working of the Dolter system at Torquay. No less than £10,549 had been spent there, in addition to the capital expenditure on the lines, in attempting to perfect the studs. The insurance company, owing to the large number of claims for injuries to persons and horses from the studs, had refused to continue the risk, and it was only at the urgent request of the Tramways Company that they had consented to continue until the end of the year. The cars used 2·3 units per car mile, and the average price paid to the Corporation was 1·6d. per unit.

Mr. JAMES SWINBURNE, F.R.S., expressed the opinion that in view of the difficulties which the Tramways Company had met with, and the manner in which they had endeavoured to overcome them, it was unreasonable for the Corporation to withhold their consent to the overhead system. He contrasted the use of overhead trolley tramways in such places as Zürich and Lucerne with the so-called æsthetic objections in England. There were exceptional difficulties on the Torbay Road, for during south-westerly gales it was flooded from the sea, and during the summer the road was watered with salt water. Further, the road had a very bad foundation, and was frequently subsiding. He described briefly the effect of water in the stud boxes, and also the carbonisation of the oil, both of which were instrumental in leaving "live" studs. In his opinion the improved Mitchell stud was not so good as the one now used, for it only employed one receptacle instead of two, thus making it more difficult to keep water from interfering with the working part. At present, the moving parts are contained in a pot which is, as nearly as possible, hermetically sealed. The great difficulty had been to secure an oil which was sufficiently heavier than water to keep it out, and, at the same time, not so heavy as to prevent the moving parts working. He did not believe the Board of Trade would sanction the system, even with the new Mitchell stud, which, he said, had not yet been constructed and put into use anywhere. Even assuming a good oil were discovered, he would not be satisfied, because it would still leave them in the region of experiment, which was not conducive to commercial success.

Mr. J. L. PRIMAVESI, Assistant Engineer to the National Electric Construction Co., described some of the details of the stud and the modifications carried out. At first the studs contained a fuse in conjunction with a short-circuiting device on the car, which operated when a stud remained alive. If, however, the fuses were made too light, they blew on starting up a car on a hill or in a heavy traffic. If too thick, the fuses did not blow, but the circuit breaker at the power-house came out. He emphasised the difficulty of getting an oil without acid, in order to avoid the metal and bitumen in the stud boxes being attacked. The oil now used, they found, was gradually attacking the metal work, although it was guaranteed not to. Criticising the new Mitchell stud, witness foresaw the possibility of arcing inside the stud box, and the consequent more rapid carbonisation of the oil. He also objected to the use of a porcelain pot in the stud box, owing to the liability of damage from heavy street traffic.

Mr. J. S. BRAITHWAITE, of Messrs. Foster & Braithwaite, spoke of the difficulty of finding capital for any tramway enterprise in Great Britain, and particularly so for a surface-contact system.

Mr. H. HOLLIDAY, Resident Engineer and Manager at Torquay, referred to the very heavy cost of maintaining the track free from live studs. For nine months in 1907, the wages bill of the track patrols amounted to £1,417, and even so there were accidents. The number of patrols had now been decreased to three, but on curves the conductors test the studs, sometimes being knocked down in the process. When a live stud is discovered, the motorman is signalled, and he stops the car and brings some insulating material, which is placed upon the stud until it is taken out for repair. The cost of the current lost by leakage in the stud boxes, represented by the difference between the current metered on the cars and at the power-station, was £679 per annum. When the Torbay Road is flooded the service has to be absolutely suspended, and this had happened four or five times a year.

The hearing was being continued when we went to press yesterday, and will be resumed on Friday.

LOCAL NOTES

Australia, Perth: *Tramway Strike.*—According to a Reuter telegram on Friday, the strike of the tramways employees in Perth, to which reference has been made in our last two issues, has been settled.

Belfast: *Street Lighting.*—In common with many other cities, the Belfast municipal authorities are finding it difficult to decide whether gas or electricity should be used for street lighting purposes. At present only two of the leading thoroughfares are well lighted, namely, Donegall Place and Castle Junction, and the brilliancy of these two streets, contrasted with the dimness of those adjoining, has often been the subject of criticism and complaint. The Police Committee, in the course of a few days, intend to substitute electric light for gas lighting in Castle Place, and its continuation, High Street, down to the Albert Memorial. Should the experiment prove successful it will possibly be extended to others.

Blackburn: *Medical Inspection of Tramway Employees.*—The Town Council have decided that all electric tramway drivers must be examined by the Medical Officer of Health at least twice per year.

Bradford: *Tramway Track Reconstruction.*—A large number of single-track lines in Bradford are at present undergoing reconstruction.

Greenock: *Supply to Admiralty.*—The supply which the Admiralty will require from the Corporation for the torpedo factory at Battery Park will be 400 kw., which is exactly double the amount originally stipulated.

Grimsby: *Commercial Methods.*—A proposal by Mr. W. A. Vignoles to hang showcards advertising municipal electricity in various properties belonging to the Corporation was discussed at the last meeting of the Council. Some objection was taken to this form of advertising electricity, and eventually the proposal was rejected.

Harrogate: *Supply Outside Boundary.*—The Corporation are recommended to apply to the Board of Trade for an order granting permission to supply certain premises outside the municipal boundary.

Hove: *Trolley Omnibuses.*—The local omnibus company have asked the Council to consider the adoption of the trolley omnibuses, but the Watch Committee do not recommend consent being given at present.

Manchester: *Gas and Electricity Committees.*—At the last meeting of the Council some discussion took place with regard to the supply of gas for cooking purposes where electricity is used for lighting. The point in itself was a small one, but Alderman Holt said it raised a serious question. The Gas and Electricity Committees were in competition for the supply of light in the town, and he thought the sooner the two Committees were joined together in one Light and Power Committee, the better it would be for the city. In his opinion they had no right to allow competition between the two departments.

New Tramways.—Several new electric tramway extensions are to be promoted in the next session of Parliament.

Newcastle: *Projected Tramways.*—The Newburn Council are urging the Newcastle Tramways Committee to extend their lines to that district. The matter was further considered at a special meeting last night, to which a deputation from the Newcastle Tramways Committee had been asked to attend.

Nottingham: *Tramway Construction.*—The work of constructing the Carlton Road tramway has been commenced. The estimated expenditure is £18,000.

Plymouth: *Street Lighting.*—The Electricity Committee are considering the use of metal filament lamps for side-street lighting.

Sevenoaks: *Electric Lighting.*—The local Chamber of Trade recommend the Council to canvass the town with regard to electric lighting before applying for a Provisional Order.

Swansea: *Electricity Works' Assessment.*—The assessment of the Corporation Electricity Works has been increased by £753, and the question of appealing against this has been left in the hands of the Town Clerk.

West Hartlepool: *Gas Critics.*—At the last meeting of the Town Council the Chairman of the Electric Lighting Committee took strong exception to some remarks made recently at the annual meeting of the local gas company. The Chair-

Digitized by Google

man of that undertaking is alleged to have made a statement from which the inference was to be drawn that the municipal electric light undertaking was not carried on in a business-like fashion, and that proper provision was not made for depreciation and wear and tear. The Chairman of the Electric Lighting Committee pointed out that for several years past the electric lighting undertaking has paid 7 per cent. on the capital invested, of which 8½ per cent. has been devoted to interest, and 8½ per cent. to depreciation.

Weymouth: *Tramways.*—A newspaper poll for or against tramways is being conducted. A deputation from Weymouth have been inspecting the Plymouth tramways with a view to forming an opinion as to the capabilities of a certain type of car which is in use there, and which has been mentioned as suitable for the proposed tramways in Weymouth. The car in question is of the demy-car type. It is a single-deck car seating 24 passengers, the driver collecting the fares as the passengers board the car. The deputation in their report call special attention to the quietness with which this type of car runs.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Accrington.—To supply electric current in bulk to Haslingden, the Council will spend £9,687. Of this £2,670 will relate to Haslingden, the rest being made up of transformers, switchgear, &c. Extra buildings, mains, &c., will absorb £9,687. To lay cables in Church will involve an expenditure of £1,002. The Corporation are now seeking powers to borrow £16,359 for the work.

Barrow-in-Furness.—Application is to be made for a loan of £5,000 for mains, £4,000 for meters, switches, &c., £500 for street lighting extensions, and £500 for plant extensions.

Bootle.—A loan of £8,500 is required; £7,500 being for feeders, distributors, and services, and £1,000 for meters.

Burnley.—In order to supply current for working the tramways in Brierfield, it will be necessary to lay cable, at an estimated cost of £1,800.

Cleckheaton.—A Local Government Board inquiry was held last week into a loan of £2,210 for cables and services.

Colwyn Bay.—An inquiry was held last week into a loan of £23,000 for new mains.

Dublin.—Under a scheme prepared by the Corporation Electrical Engineer, extensions to the high tension cables are to be carried out at an estimated cost of £3,150.

Dunfermline.—The Fife Electric Power Co. propose to erect a new sub-station at Kingseat.

Edinburgh.—The Electricity Committee invite tenders for steam turbines, direct-current generators, and condensng plant; also interior parts of cooling towers. Particulars from the Engineer, Dewar Place. Specifications may be seen at Sir Alexander Kennedy's office, 17 Victoria Street, London, S.W.

Felixstowe.—A loan of £4,260 has been sanctioned for Diesel engine plant and extensions at the electricity works. Application is also to be made for a further loan of £3,000 for mains, extensions, house services, &c.

Huddersfield.—Extensions to the electricity works at an estimated cost of £10,185 are to be carried out.

Newport, Mon.—The Electricity & Tramways Committee require rubber cables, H.T. and L.T. lead-covered cable, motor starters and L.T. switchboard apparatus, &c. Particulars from Borough Electrical Engineer, and tenders by September 20th.

South Africa.—Tenders are to be invited by the Durban Council for a switchboard, jet condenser, plant converters, and two miles of H.T. cable.

Stockport.—The Electrical Engineer reports the need for extra feeder and distributing cables, boosters, and alterations to switchboard at an estimated cost of about £7,000.

Torquay.—The Local Government Board have expressed their willingness to sanction a loan of £4,500 for mains during the next three years on receipt of a formal resolution from the Council authorising the loan.

Warrington.—The Local Government Board have sanctioned a loan of £6,257 for additional electrical plant.

West Bromwich.—An inquiry was held last week concerning a loan of £11,386 for extensions at the electricity works.

MISCELLANEOUS

Canterbury.—An electrical pumping plant is to be installed at the workhouse, in connection with the fire protection apparatus.

Nottinghamshire.—The Notts & Derbyshire Tramways Co. is making a start with its tramway scheme from Nottingham through Heanor.

Shanghai.—According to the *Board of Trade Journal*, the Shanghai Electricity Department require electric heating and cooking appliances. The consulting engineers are Messrs. Preece & Cardew, 8 Queen Anne's Gate, London, S.W.

Tasmania.—The *Board of Trade Journal* states that negotiations in connection with a proposal by the Complex Ores Co., and the municipal authorities of Lovett, Franklin, Ranelagh, Hounville, and Geeveston, for supplying electric light and power in these towns are proceeding.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Baths at Goose Green, Dulwich.

Gainsborough Road School, Canning Town. W. Jacques, 2 Fen Court, Fenchurch Street, London.

Sorting office at Leytonstone. H.M. Office of Works, London.

School at Mason's Hill, Bromley. Kent Education Committee.

Eighteen houses in York Road, Ealing. A. J. Taylor, 22 Overdale Road, South Ealing.

Twelve houses in Kingsdown Avenue, Ealing. H. Cook, 15 Shaftesbury Avenue, New Barnet.

PROVINCES.

Accrington.—Extensions to Woodnook Mill for Messrs. Higham Bros., Ltd.

Amble.—Mineral water factory in Henderson Road. The Surveyor.

Annfield Plain.—Picture theatre. Architect, L. H. Armour, 16 West Street, Gateshead.

Banbury.—Memorial to the late Dr. Parker. Town Clerk.

Barrow-in-Furness.—Manual Instruction Centre at Cambridge Street School. Education Committee.

Birmingham.—Police Station at corner of Digbeth and Allison Streets. Architects, Mansell & Mansell, 47 Temple Row. Workshops, offices, &c., in Cambridge Street. City Engineer. Municipal Baths. Town Clerk.

Blackburn.—Council School in Ross Street. Borough Engineer.

Blackpool.—Printing works for Blackpool Advertiser.

New offices in Sefton Street for Health and Cleansing Department.

Cardiff.—Electric theatre.

Colne.—New church at Primet Bridge.

Colwyn Bay.—New drill hall for 5th Battalion Royal Welsh Fusiliers. Major Keene, Mold, Flintshire.

Darlington.—Offices for Prudential Assurance Co.

Darwen.—New school in Ross Street. Education Committee.

Dublin.—Fire Station, Thomas Street. Waterworks Committee.

Dumbarton.—Academy Buildings. Dumbarton School Board.

Electric theatre at 25 George Street. Architects, Messrs. T. H. Cowieson & Co., St. Rollox, Glasgow.

Dundee.—Alterations and additions to Drill Hall. Dundee Territorial Force Association.

Laboratories at University College.

Durham.—New schools at Mount Pleasant, Spennymoor, and Closehouse (Bishop Auckland). Architect, W. Rushworth, Shire Hall, Durham.

Church, Horden. Wesleyan Church.

Exmouth.—New Petty Sessions Room and Police Station. Town Clerk.

Farnworth.—Specifications are being prepared for wiring the library. Electrical Engineer.

Folkestone.—St. Michael's Parish Hall.

Glasgow.—Chapel in Garngadhill. Architect, C. J. Menart.

Warehouse and offices at corner of Killearn Street and Saracen Street for Messrs. Greenlees & Sons. Architects, Messrs. Wyllie & Blake.

Brewery buildings in Garscube Road for Messrs. Whitbread & Co., Chiswell Street, London.

Reconstruction of premises at 55 Argyle Street for electric theatre. West of Scotland Electric Theatres, Ltd., 41 St. Vincent Place.

Hull.—Electric Theatre. Architects, Messrs. James Young & Co., 62 Market Street, Bradford.

Digitized by Google

Isleworth.—Laundry at Workhouse. Architect, W. H. Ward, Paradise Street, Birmingham.

Leeds.—Extensions to Training College, Beckets Park, Headingley. Architect, G. W. Atkinson, 1 Mark Lane.

Lincoln.—Children's Home. Board of Guardians.

Luton.—Extensions to Beech Hill Schools. Education Committee.

Manchester.—Extension to Royal Exchange. Improvement Committee.

Newcastle-on-Tyne.—Additions to Armstrong College.

Newport, Mon.—Buildings for new pumping and power station at Alexandra Docks. Sir John Wolfe, Barry & Partners, 2 Queen Anne's Gate, Westminster, London.

Paisley.—Block of buildings in Greenock Road. Architect, R. B. Millar.

Perth.—Infirmary at Tullylumb. Board of Guardians.

Peterborough.—Extensions of Deacon School. The Governors.

St. Austell.—Hospital. General Committee.

St. Helens.—Elementary school at Eccleston. The County Architect.

Shanklin.—United Methodist Chapel.

Sheffield.—A new building is to be added to the Mining Department of the University.—United Methodist Church, Penistone Road.

Primitive Methodist Chapel at Hathersage.

Skegness.—Church. Sir George McAlpine.

Southampton.—Additions to fish market. Borough Engineer.

Southport.—Municipal Buildings in East Bank Street. Town Clerk.

Stoke-on-Trent.—Hospital. Joint Hospital Board.

Sunderland.—Day Training College in Durham Road. Education Committee.

Tamworth.—Handicraft Centre at Boys' Council School.

Warrington.—Council Schools in Evelyn Street and Winwick Road. Extensions to School of Art. Education Committee.

Wellington, Salop.—Secondary School. Architects, Messrs. Shayler, Swan & Ridge.

Whitehaven.—Bank in Lowther Street. Architect, A. Huddart, 9 Lowther Street.

Wigan.—Council Elementary School, Scott Lane. Architect, H. D. Holland, 11 Library Road.

Worcester.—Primitive Methodist Church at corner of Hill Avenue.

Worksop.—Phthisis Hospital. Board of Guardians.

York.—Electric theatre in Foregate.

Lecture theatre for the Yorkshire Philosophical Society.

TENDERS RECEIVED AND ACCEPTED

Belfast.—The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., has been accepted for 37 flame arc lamps at £293.

Dewsbury.—Messrs. Cowans, Ltd., have received an order for a switchboard panel for the Electricity Works.

Dublin.—The tender of the A.E.G. Electric Co., Manchester, has been accepted for the wiring and fitting of the St. James Street workhouse, at £2,537, and £250 for maintenance.

Gosport.—The tender of Mr. W. M. Walter has been accepted for wiring the Council's offices at £55 11s.

London.—Messrs Siemens Bros. Dynamo Works, Ltd., have received the contract for the complete electrical equipment of the Palladium Theatre, Argyle Street, Regent Street, W. The wiring work has been sublet to Messrs. Rashleigh, Phipps & Co.

Montrose.—The tender of Messrs. A. & P. Steven, of Glasgow, for electric lifts at the Infirmary, has been accepted at £202.

Swindon.—Messrs. Babcock & Wilcox, Ltd., have received an order for a superheater at the Electricity Works, at £180, and a contract has been entered with the Tudor Accumulator Co. for the maintenance of the storage battery, at £66 per annum, for ten years.

Walsall.—The following tenders have been accepted:—British Westinghouse Co., rotary converters and switchgear (£1,145); Callender's Cable & Construction Co., high-tension mains (£5,026).

West Bromwich.—The tender of Messrs. C. A. Parsons & Co., Ltd., for a turbo-alternator has been accepted, subject to the sanction of the Local Government Board to the necessary loan.

Whitehaven.—The Corporation have placed an order with Ed. Bennis & Co., Ltd., for the supply of four "Bennis" stokers and self-cleaning natural draught furnaces, for B. & W. boilers, to the Electricity Works.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. E. Starkie, Borough Electrical Engineer at Burnley, is to be paid an honorarium of £60 for services rendered in preparing schemes and supervising the installation of electric lighting and apparatus at the Technical Institute.

Mr. C. H. Yeaman, who was recently appointed General Electrical Engineer to the new county borough of Stoke, entered upon his extended duties on Thursday.

An ex-Naval man, with experience in dynamos and motors, &c., requires a situation. (See an advertisement.)

An assistant engineer is required in the Operation Department of the Yorkshire Electric Power Co. (See an advertisement.)

A resident engineer is required for one of the electricity works of the county borough of Stoke-on-Trent. (See an advertisement.)

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 10s. per ton (last week, £58 5s. to £58 15s.).

Tantalum Lamps.—Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston, London) send us the testimony of a Doncaster customer that of ten tantalum lamps installed three years ago, and in constant use, only two have had to be replaced.

Metal Filament Lamps.—The Metallic Seamless Tube Co., Ltd. (Wiggin Street, Birmingham), have completed arrangements with the manufacturers to act as wholesale selling agents for the "Brimsdown" metallic filament lamps, which they state are manufactured under conditions which give complete indemnity to every purchaser.

Change of Address.—The A.E.G. Electric Co., Ltd. (121-125 Charing Cross Road), are removing to Pembroke House, 133-135 Oxford Street, W. Telephone: Gerrard 8848. Telegrams: Galvanolon, London.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Yorkshire Electric Power Co.—Satisfactory progress was reported by the chairman at the half-yearly meeting last week. There was a net profit of £2,612 for the half-year, after meeting mortgage interest. It was decided to issue 20,000 six per cent. cumulative preference shares of £5 each.

Allgemeine Electricitäts-Gesellschaft.—Dividend of 14 per cent. for 1909.

Sao Paulo Tramway, Light & Power Co.—Quarterly dividend of 2½ per cent. on capital stock.

Puebla Tramway, Light & Power Co.—The net profits for the year 1909, namely, £48,700, are an increase of about 78 per cent. on the previous year.

Shawinigan Water & Power Co.—An issue of £100,000 ordinary stock is to be offered to the assistant shareholders.

Manila Electric Railroad & Lighting Corporation.—A dividend of 1 per cent. for the quarter ending September 30th.

Wireless Telegraphy.—H.M.S. *Bonaventure* and *Antelope*, with eight submarines, have arrived at Torbay for important experiments in the use of wireless telegraphy in connection with the submarines. According to newspaper reports, one of the latest type of the vessels has been fitted with wireless apparatus, and messages have been received with success, although no messages have yet been sent from the submarines. A series of further experiments is to be carried out in Babbicombe Bay.

The Electro-Metallurgical Society.—A new institution for the study of the application of electrical processes to metallurgy has been founded, and the initial meeting was held in Sheffield on Monday last. The meeting was presided over by Mr. A. Parsons. Prof. Arnold was elected president, and Prof. McWilliam, Dr. Hutton, and Mr. T. Scott Anderson, vice-presidents. The hon. secretaries are Mr. G. B. Brook and Mr. F. Mason. Monthly meetings are to be held at the Sheffield University.

The Municipal Wiring Bill.—In addition to the list we published last week, Burton-on-Trent, Luton, South Shields, and Nelson have promised financial support to the Municipal Wiring Bill, and Oban, Redditch, and Neath will give their moral, but not financial, support.

SUMMARY

On Monday a number of telephone engineers, press representatives, and others visited Glasgow as the guests of the Peel-Conner Telephone Works, Ltd., in order to inspect the new central exchange erected by that company for the Post Office. (Page 600.)

An article by Messrs. F. J. Moffett and N. B. Rosher deals with motor control, particularly as regards three-phase motors. Time lag attachments are discussed, and a new slow-motion device for starters is described. (Page 601.)

Two Papers on checking the consumption of tramcars by individual meters were read at the Tramway Congress at Brussels. Results of their introduction at various Continental towns show great savings, and in only very few cases have they been abandoned. On the whole the hour-meter seems more popular than the watt-hour or ampere-hour meter for the purpose. (Page 604.)

Electric welding is being introduced into the metal and general hardware factories with considerable success. Machines known as point welders are used, and these are fitted with special electrodes adapted to the work, which ranges from seam welding for heavy iron drums to the welding of can and kettle spouts. (Page 605.)

A large number of awards have been made in the British section of the Brussels Exhibition. (Page 605.)

The Smoke Abatement Exhibition at Glasgow includes an effective "electric home," arranged by the Corporation Electricity Department. Demonstrations of electric cooking are being given. (Page 605.)

Under "Electrochemistry and Electrometallurgy" are described some electrical methods for the manufacture of phosphorous. A note is also given on the working of copper ores in the electric furnace. (Page 606.)

A remarkable Paper by Prof. R. A. Fessenden, read at the meeting of the British Association at Sheffield, deals with sun and wind power, giving estimates for a system with hydraulic storage with two tanks, one on the surface and the other at the bottom of a 1,000 ft. shaft, the power to be furnished partly by steam from sun-heated tanks and partly from windmills (Page 594.)

A new form of cooling tower is described on page 607.

Among the Specifications published by the Patent Office on Thursday was one by the Beck Flame Lamp, Ltd., for a multiple carbon flame lamp mechanism.—Siemens Bros. & Co. cover an improvement in Pupin coils for submarine telephone cables, which consists in covering the coil with thin metallic foil or other material impermeable to moisture.—A patent for an arc furnace for treating gases by the Chemische Fabrik Griesheim-Elektron has been surrendered as the result of opposition.—Application has been made for the revocation of a patent covering a sparking plug with cup-shaped

Digitized by Google

electrodes.—Among the patents expiring during the current week are one for a motor-driven centrifugal drying machine, and another covering an electromagnet telegraph tape perforating apparatus. (Page 608.)

IN a Paper read before the Institute of Marine Engineers, Mr. J. Lecoche described the application of his magnetic gear to marine propulsion. A slow-speed reciprocating engine drives the main propeller shaft, and a high-speed exhaust-steam turbine assists it through the magnetic gear. (Page 609.)

THE arbitration to decide whether the Torquay Tramways Co. shall substitute the overhead trolley system for the Dolter system was concluded on Saturday. Evidence was given by Mr. C. E. C. Shawfield (Wolverhampton) and Mr. S. Clegg (Lincoln) showing that the Lorain and G.B. surface-contact systems respectively were working admirably. Mr. W. M. Mordey described certain modifications of the existing Dolter stud mechanism, which he maintained would get over the chief troubles now experienced; he also suggested a new "live" stud detector, but the company stated they had actually tried this and found it a failure. Although one of the main objections of the Corporation is that the overhead wires would be unsightly, it was admitted in evidence that at one time the Tramways Committee offered to recommend the Corporation to agree to the overhead system all over the town if the Company would construct certain additional lines. (Page 609.)

THE Bradford Tramways Committee propose to purchase two trolley omnibuses.—Reductions in the charges for electricity are to be made at Eastbourne.—It is proposed to devote part of the profits of the Edinburgh Electricity Department to providing more up-to-date machinery at Dewar Place.—The question is being discussed as to whether it is legal for the Manchester Corporation to build their own tramcars.—The Newport electricity accounts show a profit of £380, as compared with a loss of £1,469 for the previous year. (Page 610.)

TENDERS are invited for turbo-alternators, boiler plant, &c., at Sheffield.—A loan of £30,000 is to be applied for, for a new turbo-alternator at Manchester.—Other loans for electrical purposes are proposed at Norwich, £18,790, and Warrington, £6,257.—The tenders of Messrs. Siemens Bros. for switchgear, and the British Westinghouse Co. for turbo-alternators for Bristol, have been accepted. (Page 611.)

THE balance sheet of the British Thomson-Houston Co. shows a profit of £10,932 after meeting debenture interest, &c. The company have exchanged licences with the owners of the Osram lamp patents on all their patents. The report of Dick, Kerr & Co. records a profit of £22,820. A dividend of 5 per cent. is proposed. The A.E.G. Co. of Berlin recommend a dividend of 14 per cent. (Page 613.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, SEPTEMBER 22ND.

Municipal Tramways Association.

10.30 a.m. Annual Conference at Bradford. (1) "Tramways in Relation to Town Planning," by A. Baker (General Manager, Birmingham Tramways). (2) "Lubrication of Car Bearings," Report prepared by Messrs. E. Cross, R. L. Acland, P. J. Pringle, and T. R. Smith.

7 p.m. Association dinner at Great Northern Victoria Hotel.

FRIDAY, SEPTEMBER 23RD.

Municipal Tramways Association.

10 a.m. Annual Conference at Bradford. Business meeting.

SATURDAY, SEPTEMBER 24TH.

Association of Engineers in Charge.

5.15 p.m. Visit to Engineering and Machinery Exhibition, Olympia.

7.45 p.m. Lecture on "Wireless Telegraphy: its Maritime Importance," by G. Langler Bullocke (by special permission of Mr. Marconi).

Association of Mining Electrical Engineers (Warwickshire and South Staffordshire Branch).

5.30 p.m. Meeting at Imperial Hotel, Birmingham. Discussion of Mr. W. Foster's Paper on "The Resistance of the Human Body to Electric Currents."

(Notts and Derbyshire Branch.)

3.30 p.m. Meeting at University College, Nottingham.

MONDAY, SEPTEMBER 26TH.

Iron and Steel Institute.

Meeting at Buxton. Reception and concert in evening in the Pavilion.

TUESDAY, SEPTEMBER 27TH.

Iron and Steel Institute.

10 a.m. Meeting in Old Theatre, Pavilion Gardens, Buxton. (1) "On Electric Steel Refining," by D. F. Campbell (London); (2) "On the Utilisation of Electric Power in the Iron and Steel Industry," by J. Elink Schuurman (Baden, Switzerland).

WEDNESDAY, SEPTEMBER 28TH.

Iron and Steel Institute.

9 a.m. Meeting in the Old Theatre, Pavilion Gardens, Buxton. Reading and discussion of Papers.

8.30 p.m. Dinner at the Palace Hotel, Buxton.

THURSDAY, SEPTEMBER 29TH.

Iron and Steel Institute.

9 a.m. Meeting in the Old Theatre, Pavilion Gardens, Buxton. Reading and discussion of Papers.

GLASGOW TELEPHONE SERVICE

BY invitation of the Postmaster-General and the directors of the Peel-Conner Telephone Works, Ltd., a number of telephone engineers, representatives of the technical Press, and other gentlemen paid a visit on Monday last to the new Central exchange of the Post Office Glasgow telephone system, a description of which appeared in an illustrated article in ELECTRICAL ENGINEERING of August 18th last, p. 581.

The new exchange is on the common battery system, and has 28 equipped subscribers' sections, and the ultimate capacity of the multiple is 14,400 lines. The incoming cables are 800 pair (1,600 wire) paper insulated, lead-covered cables of the type described in ELECTRICAL ENGINEERING, May 7th, 1908, Vol. III., p. 697. In the operator's cord circuit the repeating coil is dispensed with, and condensers are included in the speaking circuit. A 40-volt battery is used instead of the customary 24-volt. Another feature of the system is that the line resistance is made a smaller proportion of the whole, so that differences in the length of the line will cause less variation in the distinctness and loudness of speaking. The subscribers' meters are operated by the 40-volt battery.

The party, who were joined by a number of local representatives and Corporation officials, were entertained at lunch by the Directors of the Peel-Conner Telephone Works, Ltd. Mr. H. Hirst, Chairman of the Peel-Conner Co., after reading a letter of congratulation from the Postmaster-General, Mr. H. Samuel proposed the toast of the Post Office engineers, and referred to the personal work of Mr. A. M. Ogilvie, Assistant Secretary of the Post Office. In reply, Mr. Ogilvie pointed out that the Central Exchange was only the first of a series of new exchanges in Glasgow. It was pleasing to see that the Postmaster-General had adopted the policy of encouraging the telephone industry as a British industry, and he thought the new exchange was a triumph for the recently-formed company. Much credit was due to Mr. Hirst and Mr. M. S. Conner. Mr. Conner then enumerated the chief new features of the exchange, and remarked that it was the best central-battery exchange in the world, and would do duty for at least thirty years. In reply to the toast of the Corporation of Glasgow, Bailie Dunlop responded on behalf of the Lord Provost, stating that it was evident that the Post Office intended to keep the telephone system up to date. Mr. W. A. Smith, a director of the National Telephone Co., wished the Peel-Conner Co. every success. The party was then joined by the Lord Provost of Glasgow, and an official inspection of the exchange was made, followed by a visit to the Trunk Exchange at the General Post Office, which was enlarged and entirely re-equipped with apparatus of the latest patterns last year.

New Rolling Stock for the Metropolitan Railway.—Some new coaches are to be adopted experimentally on the Metropolitan Railway. According to the *Evening Standard*, each coach is to have three compartments, with a gangway in the centre running the whole length of the coach, and a door to each compartment. On either side of the gangway in each section seats are provided for four passengers, while the seat at either end of the coach can accommodate six people, making twenty-eight seats altogether in the coach.

THE CONTROL OF THREE-PHASE MOTORS

By F. J. Moffett and N. B. Rosher

DIRECT-CURRENT motors have been in general use for a considerably longer period than those working with alternating-current, and the apparatus for the control of the former has reached a position somewhat approaching finality. Alternate-current motors, on the other hand, are a more recent development in this country, and the switchgear necessary for their starting and protection is still more or less in a state of fusion. It is now recognised fairly generally that direct-current motors should be protected against injurious overloads and provided with some suitable device to prevent the motor restarting after a temporary failure of supply; and it is gradually becoming an accepted proposition that the same provision should be made in the case of alternate-current motors, although the latter possess a rather more robust constitution.

As an instance of the present unsettled state of the switchgear for alternate-current motors, we may mention a case which was recently tried before the Official Referee in London. The plant which was the subject of litigation consisted of a motor-driven pump used for unwatering a mine. The pump was driven by a three-phase squirrel-cage motor, which was connected to the supply mains by means of a three-pole switch and three fuses, the size of the latter being calculated to carry the starting current. Owing to bad regulation of the supply, the motor was continually coming out of step, and consequently carried currents of abnormal value, since the fuses were too large to operate at any ordinary overload. The representative of the firm which supplied the plant stated that it was the usual practice to instal fuses of sufficient size to carry the current at starting, and was not disposed to admit that this procedure by no means adequately protected the motor under normal running conditions. The need for more efficient protection was very forcibly demonstrated by the fact that the stator winding was repeatedly ruined by overheating.

We may safely assume that in the case both of direct and alternating-current motors of any considerable size, it is advisable to provide for the automatic disconnection of the motor from the supply mains in the event of an excessive overload being put on the motor for a period of sufficient length to cause injury to the windings, or of a temporary failure of the supply, which involves the risk of serious accidents on the supply being resumed.

The most usual method adopted to provide against the above-mentioned contingencies is to instal a circuit-breaker fitted with a "no volts" trip coil and with one or more overload coils, or, alternatively, with fuses.

Circuit-breakers with overload trips suffer under a peculiar

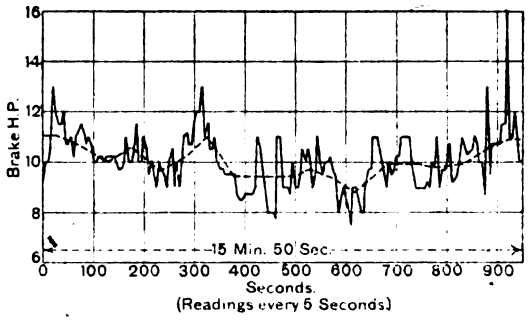

FIG. 1.—POWER CURVES FOR 10 B.H.P. THREE-PHASE MOTOR DRIVING :—

disadvantage owing to the rapidity of their action. The current need only reach for a fraction of a second the value corresponding to the overload at which the breaker is set in order to operate the breaker, and this in ordinary circumstances is an undesirable arrangement, as the current through the motor often rises instantaneously to this value, but it is not maintained for a sufficient length of time to allow of any injurious action taking place.

The difficulty due to the rapid operation of the overload release of a circuit-breaker can, however, be met by the provision of an inverse time element device or time-lag, which allows of the passage for short intervals of time of a current much in excess of that necessary to operate the breaker if applied continuously. The curve in Fig. 1 shows the variation of the load on a motor which is employed in driving a line shaft from which several machine tools are driven. It will be noticed that whilst the average load as shown by the broken curve is only 10 h.p., there are several peaks during which the h.p. rises to 13 h.p., and occasionally reaches 16 h.p. If the ordinary breaker is used and set at, say, 50 per cent. overload, it would be constantly cutting out the motor owing to the sudden short demands for power. These demands, whilst not of sufficient duration

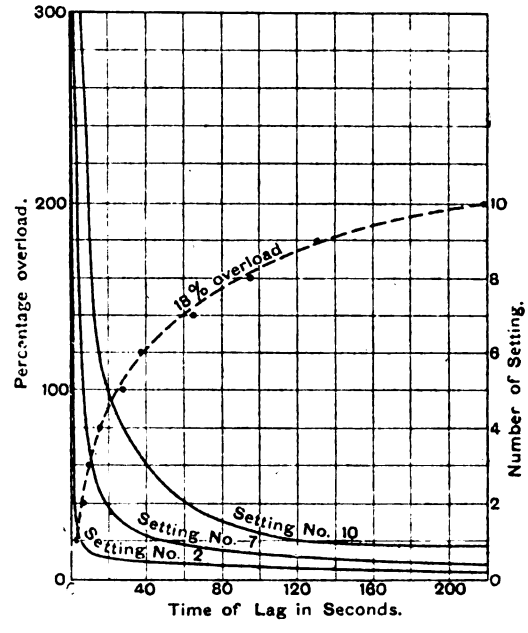

FIG. 2.—TEST OF VARIABLE SETTING OF TIME LAG.

to cause overheating of the motor, would be quite large enough to operate the breaker.

The only satisfactory way to dealt with this position of affairs is to fit on the circuit-breaker a time-lag with a characteristic corresponding to the load characteristic of the motor; that is to say, a time-lag which will allow of an overload only for such a period as will not prove injurious to the motor winding. As is well known, a number of such devices, depending on various principles, are on the market. The Statter time-lag depends on the suction of two surfaces between which is a film of oil or other liquid. Mr. Palairet, of Messrs. Siemens Bros. Dynamo Works, is responsible. for the introduction of a time-lag depending on the resistance to motion of air vanes. A small fan is driven by a train of wheels actuated by a rack attached to the tripping gear of the circuit-breaker. An example of another class of time-lag is the one invented by Messrs. Morris & Lister depending on the expansion of a metal strip which releases a trigger and thereby operates the breaker. A different principle is involved in the relay invented by Dr. Garrard and made by Messrs. Ferranti, Ltd. It consists of a shunted meter element which by its rotation winds up a cord to which a weight is attached. It also moves together at the same time a pair of contacts which close the tripping coil circuit. The position of one of the contacts is adjustable so that the time limit can be adjusted.

Mr. George Ellison has recently introduced a modification of the suction disc time-lag in which provision is made by varying the clearance between the bottom of the cylinder and the piston for a series of settings of the lag with the same setting of the plunger of the overload coil. The results obtained by the writers from three of these settings are given in the curves in Fig. 2, the current being increased from 6 to 20 amperes. The broken line curve gives the various lags obtainable with a constant current of 6·5 amperes and settings from 1 to 10.

It is sometimes necessary to instal circuit-breakers at

Digitized by Google

different points in the same circuit; in such cases this arrangement enables all the breakers to be set for the same current, but for different time-lags. The breakers will then, in case of overload, come out in any required order, or possess what is usually termed a discriminating characteristic. Time-lags depending on the suction between two surfaces possess the desirable feature that the position of the plunger or armature of the overload coil remains constant until the current has risen for a sufficient period to a value high enough to operate the release. This prevents what is usually termed "climbing up the setting," or "floating."

A method used occasionally to give a time element characteristic to an ordinary circuit-breaker is to shunt the trip coil with a fuse. The current normally flows through the fuse, and not through the trip coil until the fuse blows, when the whole current passes through the trip coil. This method can only be adopted with alternating current as with direct current, practically the whole of the current passes through the trip coil, and the fuse will not blow.

We shall now consider shortly the points of difference between circuit-breakers for direct and for alternate current. With direct current it is possible to use solid iron for the magnetic circuits, but in breakers for alternating current it is usual to laminate or split the yoke and plungers of the solenoids on account of the heating due to the eddy currents produced. The "no-volts" coil fitted to a direct-current breaker cannot easily be wound for a higher voltage than 250 volts, and consequently, when higher voltages are used, it is necessary to take up the excess above 250 volts in an external resistance; the limit in the case of alternating currents is, on the contrary, above 400 volts. As an alternating current arc does not persist to the same extent as the direct current, it is not so customary to fit blow-out coils on alternating-current breakers, and an additional advantage which the latter possess over the former, is that they can be immersed in oil. Oil-immersed breakers are practically a necessity in places such as coal-mines, and consequently, the alternate-current system possesses a great advantage in this respect.

With respect to three-pole breakers for the control of three-phase motors, it is necessary in order to comply with the conditions that an overload coil be inserted in two of the three phases, in order to provide against the interruption of one phase, and consequent heavy currents flowing through the motor. In order to obviate the necessity for using two overload coils in the case of a slip-ring motor, Mr. Ellison has adopted the plan of inserting one overload coil in the rotor circuit. This will naturally operate when the load on all three leads to the motor exceeds the safe limit, but it also protects the motor windings in the event of one phase of the supply being interrupted. Even when the motor is only partially loaded, there is a large increase in the stator and rotor currents when one phase of the supply is interrupted.

In order to ascertain the lowest percentage of full load at which the current on breaking one phase rises to a value sufficient to operate the overload trip, a test was made by the writers on a 10 b.h.p. three-phase slip-ring motor, wound for a voltage of 200 and a periodicity of 50 ~ . At full load the value of the rotor current was 65·5 amperes, and it was found that, with the overload trip set to operate at 25 per cent. overload, the lowest value of the rotor current, at which the overload trip operated on the interruption of one phase, was 35 amperes, or about 50 per cent. of full load on the motor. Naturally, should the load on the motor when one phase is interrupted not exceed 50 per cent. of full load, the increase of current would not be sufficient to cause an injurious rise of temperature in the windings.

There is an objection to this scheme, since it does not allow of the use of a short-circuiting and brush-lifting device on the motor. This, however, is not a very serious disadvantage, as the loss in efficiency, when carbon brushes and cables of ample sectional area are employed for the rotor connections, is so small as to be almost negligible, and even this economy is frequently rendered inoperative owing to the attendant omitting to make use of the brush-lifting and short-circuiting device.

We shall now discuss generally the starting of motors, dealing more particularly with three-phase induction motors.

For the efficient operation of a starting-switch it is essential: (1) that the switch arm should move rapidly from contact to contact to prevent undue arcing, and (2) that the arm should pause for a definite period on each contact in order to enable the motor to reach the speed corresponding to the voltage on that contact.

With the ordinary type of starter the speed of the arm between contacts and the length of pause on each contact is left to the attendant, who generally does not take excessive care to observe the two conditions stated above To obtain the requisite slow motion, starters have been fitted with a worm gear and also with a dash-pot motion, the latter device automatically allowing the starter-arm to travel over the contacts at a predetermined slow rate. Unfortunately, with the above device the rate of travel between the contacts is equally slow, and burning of the contacts ensues. The converse of the above is the ratchet type of starter, which allows of a quick movement from contact to contact, but does not enforce a pause on each contact.

After a careful consideration of the existing types of starters, the authors were led to the conclusion that there was need for a more effective starting motion, and they therefore designed a starting mechanism which fulfils the two conditions above stated. The scheme adopted will be clear from an inspection of Fig. 3. It is evident that each operation of the starting-switch handle rocks a lever, and thus causes the plunger of a dash-pot to be depressed. Until the plunger has been forced back to its normal position by means of a spring, further operation of the switch-handle is impossible, since a stop, or retaining-dog, has been moved into its path. The interval between successive movements

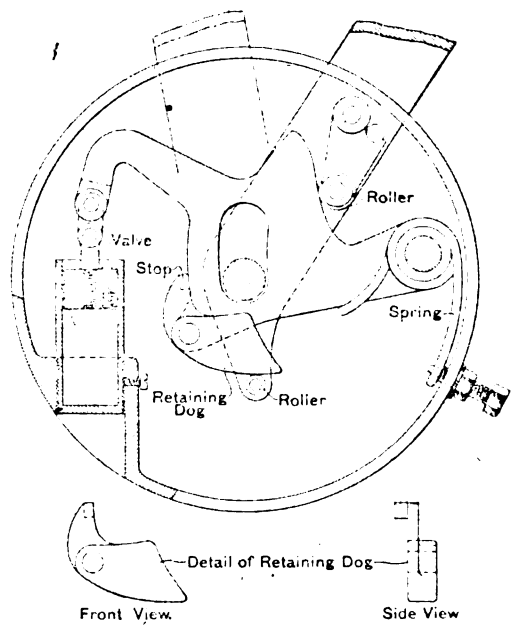

FIG. 3.—SLOW MOTION ATTACHMENT TO STARTER.

of the handle can be regulated within wide limits by adjusting the air-vent in the plunger or the strength of the spring which acts upon same. As a general rule starting-switches are provided with too large a number of steps or contacts, the necessity for these arising out of the desire to provide for a gradual raising of the voltage applied and the avoidance of current rushes. With the mechanism just described, the need for a large number of steps disappears, since a sufficient pause is enforced on each step to enable the motor speed to rise to the full value corresponding to that step. The advantages of this device are specially evident when it is applied to a two-position switch, such as the star-delta or auto-transformer, where a prolonged pause on the intermediate position is an absolute necessity.

The switchgear for the starting and protection of a slip-ring motor should provide for: (*a*) Making the stator circuits and breaking same in the event of an overload being put on the motor, or a failure of supply taking place; (*b*) making the rotor circuit through resistances and gradually short-circuiting these, and (*c*) rendering it impossible to start the motor without all the resistances being inserted in the rotor circuit.

The type of rotor rheostat most commonly employed for small and medium-size motors is the face-plate variety, with iron grid or wire resistances, but liquid starters are more usually employed for large motors. The latter allow of the gradual reduction of the resistance, without the sudden jumps which are inseparable from the metal type of rheostat. There is considerable divergence of opinion amongst motor manufacturers as to the voltage for which rotors should be wound. The following are the rotor currents for a 400-volt,

Digitized by Google

three-phase, 25 ~ motor of 10 b.h.p., as supplied by four of the leading manufacturers :—

Firm A.	Firm B.	Firm C.	Firm D.
30 amps.	35 amps.	63 amps.	100 amps.

In these days of standardisation, one would expect that a definite ratio between primary and secondary voltage would have been adopted. From the point of view of the switchgear, a high voltage possesses advantages, as it enables leads of smaller section to be used, and reduces the C^2R losses in these leads. Probably one reason for the variation is that a bar-winding is preferred by some firms to a wire-winding, on account of the better mechanical features of the former.

The curves in Fig. 4 show the relation of starting torque

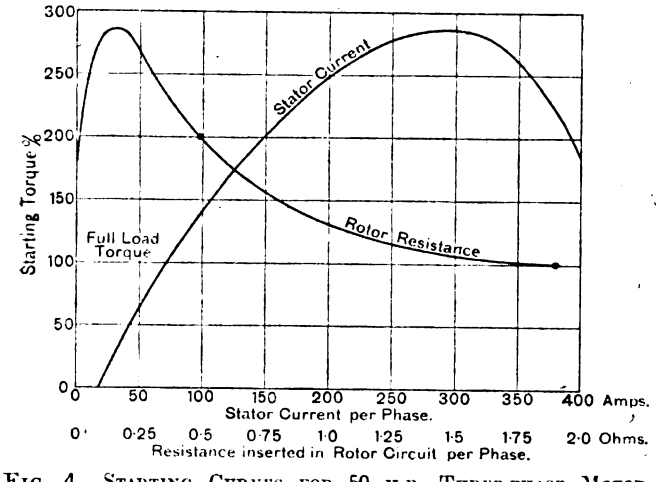

FIG. 4.—STARTING CURVES FOR 50 H.P. THREE-PHASE MOTOR, 400 VOLTS, 25 CYCLES.

to resistance in rotor circuit, and of starting torque to stator current in the case of a three-phase induction motor of 50 h.p., 400 volts, 25 ~. For these we are indebted to Mr. Stanley P. Smith, of the General Electric Co., Ltd. From such curves the total resistance to be inserted in the rotor circuit to produce a given torque, and area of same can be found, but in order to determine the values of the different sections, it is necessary to know the relations between torque and resistance at various speeds between standstill and synchronism.

The curves shown in Fig. 5, taken from Maurice Oudin's

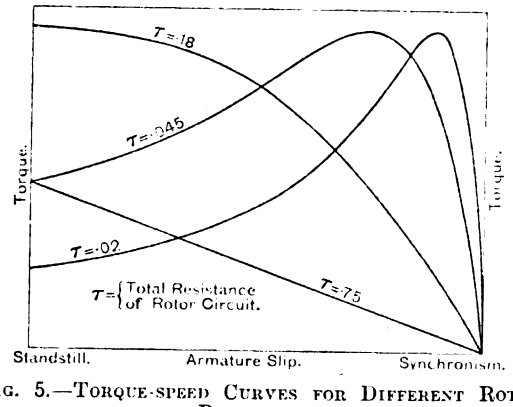

FIG. 5.—TORQUE-SPEED CURVES FOR DIFFERENT ROTOR RESISTANCES.

"Standard Polyphase Apparatus and Systems," shows the varying values of the torque at different speeds for certain values of the rotor resistance. A perfect starter would provide the necessary drops in resistance of rotor circuit at the proper points in the progress of the motor from standstill to full speed, the time interval between these points being, of course, dependant on the rate at which the motor accelerated with the existing conditions of load.

In the case of the squirrel-cage motors, all control must be effected in the stator circuits. Since it is not possible to vary an external resistance in the rotor circuit, the current at starting reaches a value far exceeding that corresponding to full-load torque when running near synchronous speed, even when there is no load on the motor. With the aid of the oscillograph, an examination was made of the values at starting of the current for a 10-b.h.p. squirrel-cage motor wound for a voltage of 200 and a periodicity of 50 cycles, which showed that the starting current reached at least 300 or 400 per cent. of the full load values. There is thus some difficulty in providing for the protection of these motors against overloads. If fuses are used for this purpose, and are of sufficient capacity to carry the starting currents, they will afford no protection to the motor in the case of an ordinary overload of, say, 100 per cent. of full load. This difficulty is generally overcome by the device of short circuiting the fuses until the motor has run up to speed. With breakers the difficulty is apparently just as great, if not greater, since there is no interval of time between the current reaching its limiting value and the operation of the breaker. It is common practice to set a circuit-breaker to operate with a current 50 per cent. in excess of full-load current; a time element device will enable the breaker to carry this overload for several seconds, or an overload of 500 per cent. for, say, one second, a period often long enough to effect the starting of the motor. It is possible that a still longer lag with high overloads could be obtained by arranging the saturation of the core of the overload solenoid at a moderate overload. The pull would not then increase proportionately with the current.

A different method of enabling the breaker to tide over the starting period consists in the use of what is known as a double-rating device. An additional load is placed on the plunger of the overload solenoid during the starting period, and is removed as soon as full speed is obtained. In the breaker made by one firm the plungers of the overload solenoids are gripped by springs operated by means of an auxiliary coil, which is only in circuit whilst the switch is in the starting position.

There are four methods in common use for starting up squirrel-cage motors.

Switching direct on to the mains is at present practically confined to small motors of not more than 5 h.p., since the supply companies find these sudden large demands do not make for good voltage regulation on their systems.

Another method is switching on through resistances which can be gradually cut out, the resistances being inserted in all three or in two phases, or a reduced pressure may be applied by an auto-transformer or compensator. In the auto-transformer method of starting it is the usual practice to provide several tappings so that various starting voltages may be obtained. When the motor is put into service, the lowest voltage compatible with obtaining sufficient starting torque is employed; and should it be necessary on account of increasing the load to increase this torque, it is only necessary to change the tapping at which connection is made for the starting voltage. For economical reasons, the amount of copper and iron in the auto-transformer is reduced to the lowest limit, consequently provision should be made against the starting switch being left in the intermediate position for any length of time, or dangerous overheating will occur. Further, it should not be possible to connect the motor direct on to the line, or the excessive currents which it is desired to avoid will be derived from the line. Many auto-transformer switches now on the market do not provide for either of these conditions.

Dr. Benjamin Bailey has recently discussed in the *Electrical World*, of New York (January 2nd, 1909), the comparative advantages of the rheostatic and transformer types of starters. He has stated the case so clearly that we make the following extracts from the article :—

"The great fluctuation in voltage when a squirrel-cage induction motor is started from rest is due not so much to the current taken as to the low power factor. A current that is in phase with the E.M.F. reduces the voltage of the circuit very little. When, however, the current lags 90° behind the E.M.F., the reduction is much more marked. If, therefore, the current which the induction motor takes at starting is considered as divided into two components, one in phase with the E.M.F., the other lagging 90° behind it, the one in phase reduces the voltage but little, while the component lagging 90° reduces it very greatly.

"It can easily be shown that the wattless component of the starting current is the same whether an auto-starter is used or whether the motor is started by resistance alone.

"It is evident, without proof, that the value of the volt-amperes received by the motor at starting will depend solely upon the voltage impressed upon its terminals. Hence it is seen that the component of the current actually reaching the motor, which causes the reduction in voltage when the motor is started, is the same whether an auto-starter or rheostatic starter is used."

He points out that of the two starters, the auto-starter requires a larger wattless component of current from the line

Digitized by Google

than does the rheostatic starter, and consequently the fluctuation in voltage is fully as great with the auto-starter as with the rheostatic starter. There is another respect in which the rheostatic starter is superior. As soon as the motor gets under way the current becomes less; this change, of course, reduces the CR drop through the rheostat, and consequently a higher voltage is supplied to the motor. Thus either less current will be required in the motor or a greater torque will be available than if an auto-starter were in use. With the auto-starter, the starting voltage and the maximum available torque remain practically constant until the motor is connected directly to the line. In starting certain loads, such as a fan, where the torque required increases somewhat with the speed, this is a decided advantage in favour of the rheostatic starter. For a given value of starting current, the motor will attain a higher speed with the resistance starter than it would with an auto-starter, and the circuit is not opened during starting. This avoids burning the contacts.

The rheostatic starter is much cheaper than the auto-starter, but requires in starting more current from the line in proportion to the ratio of the voltages of the auto-transformer. The extra power used would probably not amount to more than 15 per cent. This difference decreases as soon as the motor gets under way. The wattless component of the line current required by the motor is somewhat less with the rheostatic starter; consequently the disturbance to the line voltage, on starting the motor by the two methods, is approximately the same. The starting can be made somewhat more gradual with the rheostatic starter, since it is feasible to introduce a number of contacts, and the disturbance on finally connecting the motor to the line is less than with the auto-starter.

In order to confirm the results arrived at by Dr. Bailey, the writers carried out tests on a 7½-h.p. squirrel-cage motor wound for a voltage of 440 volts and a periodicity of 25 cycles. This motor was first connected up to a rheostatic starter, the total resistance of which was of such value as to produce half the full-load torque of starting, and was subsequently connected to an auto-transformer starter, arranged to produce the same starting torque.

The results obtained are as follows :—

	Volts on motor.	Starting torque (% full load).	Starting current (times full load).
Rheostatic starter ...	220	0·475	2
Auto-starter	225	0·517	1·73

The method is applicable to motors which are designed for running under normal conditions with the stator windings connected in mesh. The ends of the stator windings are brought out to convenient terminals so as to enable them to be connected in star. The starting switch first applies the line voltage to the stator when star connected and when the rotor has run up to speed changes the connections to mesh. The starting torque with star connection reaches one-third of the full-load torque, with a current 0·577 of that required to produce a full-load torque at starting with Δ connections. The star-delta method of starting has the advantage over the two previous methods in that it avoids the necessity of employing transformers or resistances, the only switch required being a simple change-over switch. It should be borne in mind, however, that it requires extra terminals on the motor and double the number of leads between motor and starter.

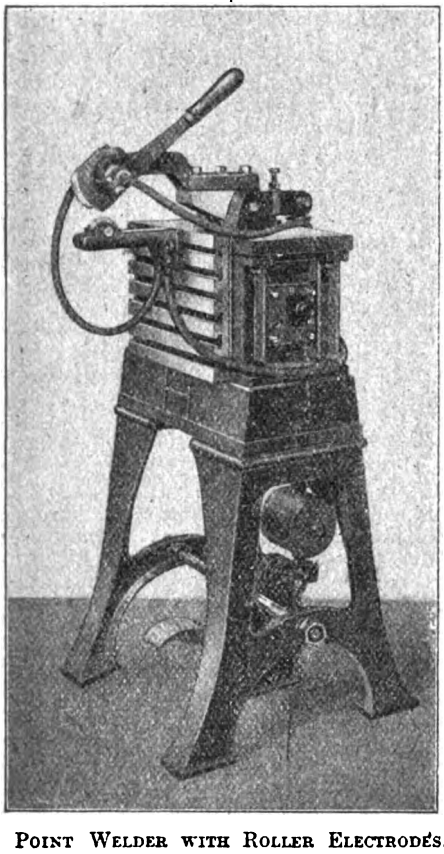
Whatever method of starting is employed, squirrel-cage motors have but little starting torque, in spite of their requiring a large starting current.

Numerous ways have been proposed of escaping from this difficulty. Naturally, the first and perhaps the best scheme to be adopted is to fit an automatic clutch, which will enable the motor to start absolutely light, and only take up its load after acquiring a suitable speed. If the motor is controlled by a star-delta change-over switch, the starting current can be reduced by practically one-half and full-load torque exerted by the motor on the load with not more than twice full-load current. Several firms supply motors fitted with this type of clutch, some of which are capable of reversing. They possess the further advantage of enabling provision to be made for slipping to take place when the overload on the motor exceeds the desired value.

Other methods which may be mentioned are those of Görges, who alters the arrangement of the rotor windings at starting so as to reduce the secondary current; of Boucherot, who provides the rotor with two or more independent windings of varying resistance and inductance; and of Zani, who uses auxiliary inductance coils to limit the starting current, and subsequently automatically reduces the impedance of these coils by increasing the reluctance of their magnetic circuits. All these arrangements appear, however, rather complicated for ordinary everyday use.

CAR METERS

TWO reports dealing with questions of checking the consumption of current of tramcars by meters on the cars themselves with a view to economical driving were read at the recent International Tramway Congress at Brussels, and are translated in the Official Circular of the Tramways and Light Railways Association. One of these, by Mr. Battes (General Manager, Frankfort Municipal Tramways), contains a *résumé* of the opinions expressed at previous Congresses, when Mr. Otto, of the Grosse Berliner Strassenbahn Gesellschaft and the author himself both spoke from experience of the advantages to be obtained, and favoured the use of simple hour meters as cheaper than watt-hour meters and sufficiently accurate. M. Bouton (East Paris Tramways), however, advised the use of ampere-hour meters. A considerable amount of information has now been obtained, and a digest of the experience at different Continental towns is given in the report. Of some 34 cases where particulars are given, the largest total saving is that of the Berlin Co., all of whose cars (1,491) have been fitted with hour meters at a cost of £2 each, and a total saving due to their use of £21,344 per annum, or 7·8 per cent., is reported. At Cologne, where all the cars are also equipped with hour meters, a saving of 8·6 per cent. is given, and at Dresden the figure is as high as 10·95 per cent. The highest figure given is for Magdeburg, where only 42 out of 130 have meters, but a saving of 19 per cent. is recorded. All the cars are equipped with meters also at several other towns, and savings varying from 1·25 to 15 are reported, where figures are available. Other authorities are still experimenting, and only three cases are mentioned where car meters have been discontinued. In 11 cases out of the 34 of which particulars are given, hour meters are used, in 3 cases ampere-hour meters are preferred, while the remainder use watt-hour meters. In some cases it is reported that the use of car meters made it possible to provide accelerated services, and the Cologne tramways declare that the use of meters has led to a decrease in the number of accidents.



The other report is by M. Bouton (General Manager, East Paris Tramways Co.), who compares the advantages of watt-hour, ampere-hour, and hour meters. He considers most watt-hour meters too delicate and liable to become inaccurate, and prefers a simple form of ampere-hour meter. He does not think that the hour meter gives sufficient information. Various methods of rewarding drivers whose meters show economy are suggested.

New Swiss Electric Railway.—The new single-phase railway connecting Orsières with the Swiss State Railway system at Martigny (Canton Valais) was opened to public service last month. The railway has been constructed for the Cie. du Chemin de Fer Martigny-Orsières, in connection with the British Aluminium Co.'s water-power works now under construction at Orsières, but may become of considerable national importance, as it may form the first section of a suggested new line connecting Switzerland with Italy. The capital for the railway has been provided entirely in this country. The length of the line is about 12 miles. It is a normal gauge railway, with 80-lb. rails laid on impregnated beech or oak sleepers. The minimum radius of curvature is 197 yards, and the maximum gradient 3·5 per cent., or 1 in 28·6. A great deal of blasting and tunnelling has had to be done, particularly in the gorge of la Drance, where the line traverses two bridges, four galleries supported on the side of the mountain, and three tunnels, while in the neighbourhood of Sembrancher there are three bridges, two galleries, and four tunnels. The trolley-wire supplies single-phase current to the trains at 8,000 volts, 15 cycles, and consists of an 8 mm. wire with simple suspension, except in the stations, where catenary suspension is employed. Each passenger motor-coach is fitted with four 80-h.p. single-phase motors of the Brown-Boveri type, in which regulation is effected by altering the position of the brushes on the commutator. The weight of a complete motor-coach is 45 tons. Three brakes are fitted, hand, electric and compressed air respectively. The speed on the level is 25 m.p.h., and 19 m.p.h. on a gradient of 3·5 per cent. Work was commenced on the line on August 1st, 1907.

ELECTRIC WELDING IN HARDWARE FACTORIES

ELECTRIC welding is being introduced with considerable success into metal and hollow-ware factories in place of soldering, brazing, and riveting. There are two main processes of electric welding, viz., the arc welding process and the resistance method. The former is employed principally for the repairing and elimination of faults in casting, &c., whilst the latter is adapted for use in metal work factories producing repeat work, where the low cost of operation and the rapidity of manipulation tend to a reduction of works costs. Resistance welding machines consist of a transformer, the primary of which is connected to the supply mains and the secondary to the electrodes between which the articles are welded. This method of welding is divided into two classes, viz., "butt" welding and "point" welding.

Point Welder with Roller Electrodes.

In butt welding, the two pieces to be welded are pressed together and a heavy current at low voltage is then passed through the joint. Upon the welding temperature being attained, the current is cut off and the weld is then completed by applying a sudden increase of pressure. The weld is perfectly homogeneous and differs in no way from the solid piece of material. The heat is generated first in the centre of the material, and then penetrates to the outer surface, so that oxidation, burning of the surface through overheating, or formation of scale, is impossible. Further, the operator can follow the process without being handicapped by the presence of fumes and heat. Shafts, hoops, metal tyres, rods of all sections, &c., are welded by this process. Cycle rims having a cross sectional area of about 0·5 sq. in. take about 16 kw. for 20 seconds for each weld, while heavy wheel rims of some 0·7 sq. in. section take about 25 kw. for 45 seconds. Shafting of about 1¾ in. diameter would take 30 kw. for 60 seconds for every weld. A number of different patterns of butt-welders have been designed by the A.E.G. Electric Co., Ltd. (121 Charing Cross Road, London), and include hand-operated, semi-automatic, and automatic machines. These machines are covered by British patents No. 22,981/03 and 6,127/04.

Point welding is employed in the hollow-ware, enamel ware, and general hardware industries, and replaces riveting. In point welding the materials are placed in position between the open electrodes, which are then brought together by means of a foot lever which closes the circuit. A further depression of the lever completes the welding. Upon pressure being removed from the lever the current is cut off and the material released from the machine. In the welding of thin sheet material the welding is practically instantaneous. A point welding machine of the A.E.G. Electric Co.'s design is illustrated herewith. The lower electrode is adjustable, and is carried by a massive bracket, which serves to support the article being operated upon, and at the same time may be used as an anvil. The upper electrode is carried on the end of a pivoted arm connected to a foot lever, which, upon being depressed, first brings the electrode down into contact with the work. At the right-hand side of the machine a change-over switch is mounted, by means of which the power may be regulated according to the work in hand, and at the left-hand side D.P. fuses are fitted. The machine illustrated has roller electrodes which are especially adapted for such work as the welding of spouts on to cans or the welding of seams in hollow ware. The power taken by these point welders is from 3 to 40 kw., according to the thickness of the material being worked. The upper electrode can be operated automatically, and is used for the making of continuous point welds, or point welds at predetermined distances. With electrically-welded enamelled articles, there are no projecting rivet-heads from which the enamel is liable to flake off. The A.E.G. Electric Co., Ltd., will give any further information respecting the welding of special articles, and will weld samples of firms' own productions free of charge, giving data as to the time taken and the approximate cost of carrying out the work.

AWARDS AT THE BRUSSELS EXHIBITION

THE full list of awards at the Brussels Exhibition is now published. A list of the principal awards to British exhibitors whose exhibits were of interest to electrical engineers is given below :—

Scientific Instruments : *Grand Prix.*—Kelvin and James White. *Gold Medal.*—The Reflector Syndicate. *Silver Medal.*—W. J. Brooks & Co., Messrs. Gambrell Bros., J. J. Griffin & Sons, Townson & Mercer.

Steam Plant : *Grand Prix.*—E. Green & Son, Ltd., J. Hopkinson & Co. *Diploma of Honour.*—The Underfeed Stoker Co., Ltd., G. & J. Weir, Ltd. *Gold Medal.*—Holden & Brooke, Ltd., The National Gas Engine Co., Ltd., The Oil and Waste Saving Machine Co., Ltd., The Sturtevant Engineering Co., Ltd.

Other Kinds of Engines : *Grand Prix.*—Crossley Brothers, Ltd., The Campbell Gas Engine Co., Ltd., The Power Gas Corporation. *Gold Medal.*—The National Gas Engine Co., Ltd. *Bronze Medal.*—Reavell & Co., Ltd.

General Machinery : *Grand Prix.*—Hans Renold, Ltd., R. Waygood & Co., Ltd. *Diploma of Honour.*—Marryatt & Place, Reavell & Co., Ltd., G. & J. Weir, Ltd.

Mechanical Production and Utilisation of Electricity : *Grand Prix.*—Kelvin and James White, Ltd., The Morgan Crucible Company, Ltd., C. A. Parsons & Co., The Reflector Syndicate, Ltd., R. Waygood & Co., Ltd. *Diploma of Honour.*—Marryatt & Place. *Gold Medal.*—Lancashire Dynamo and Motor Co., Ltd.

Electro-Chemistry : *Gold Medal.*—John J. Griffin & Sons, Ltd., The Reflector Syndicate, Ltd.

Electric Lighting : *Gold Medal.*—Faraday & Sons. *Silver Medal.*—Ropley. *Bronze Medal.*—J. Dugdill & Co.

Miscellaneous Applications of Electricity : *Grand Prix.*—Kelvin and James White, Ltd., R. W. Paul. *Diploma of Honour.*—Gambrell Bros., Nalder Bros. and Thompson, Ltd., The Synchronome Co., London.

The Cambridge Scientific Instrument Co. were placed *Hors Concours.*

GLASGOW SMOKE ABATEMENT EXHIBITION

THE Electricity Department of the Corporation of Glasgow have made good use of the opportunity afforded by the Smoke Abatement Exhibition now being held in Glasgow, to demonstrate the practical advantages of electric lighting, heating, and cooking. Their exhibit comprises a tastefully arranged model home, with three living rooms, kitchen, laundry, and bathroom. There are no fireplaces or chimneys, the ventilation being effected on the Glover-Lyon system, in which the air is circulated and heated by electrical means. A large variety of domestic appliances supplied by Simplex Conduits, Ltd., the General Electric Co., the British Thomson-Houston Co., and other firms, are shown in use, and the special advantages of electric cooking are being practically demonstrated by an enthusiastic *chef.* The various rooms are most effectively lighted, and some novel radiators for fixing underneath tables and desks are shown. Several different patterns of electric ovens are being used daily, and interesting comparisons are being made. The new G.E.C. range is giving particularly good results, and the "Tricity" D.C. cookers and the Bertram-Thomas "Gray" oven are proving their convenience and efficiency. Messrs. Giffen & Bissett, Ltd. (Cathkin Laundry, Rutherglen), who employ electricity for irons, &c., as well as for lighting and power in their laundries, demonstrate the use of electric irons of various sizes. The bathroom contains a "Therol" heater and electric geysers. A number of Glasgow contractors have arranged effective exhibits, and there is a brilliant display of metal filament lamps. There are also exhibits to illustrate the convenience of electric drive for sewing machines and other domestic appliances. The Telewriter, an instrument for taking down autographic messages, several patterns of the "Beck" and other flame lamps, the Mavor & Coulson tube-cooled motor, and other interesting apparatus, are also exhibited. There is an extensive exhibit of gas lighting and cooking apparatus, and as the representatives of the two rival methods are collected on the two opposite sides of the hall, an instructive comparison of the æsthetic and hygienic conditions resulting may be made.

ELECTROMETALLURGY AND ELECTRO-CHEMISTRY

IN the last number of the *Elektrochemische Zeitschrift* (XVII., p. 91), there is an article by Dr. C. Herrmann upon the "Present Position of the Manufacture of Phosphorus by Electrical Methods." As a matter of fact, the bulk of the phosphorus manufactured to-day is made by electrical processes. The first process, which was started in 1893, was that of Parker, Robinson, and Readman, and even now most of the works use this process, or a modification of it. It is, however, by no means easy to know exactly what is done, as the manufacturers maintain the strictest secrecy. The process, as originally designed, consisted in striking an arc in a closed receptacle, containing a mixture of calcium phosphate, silica, and carbon. This particular mixture had, in fact, been used before in the old fire-heated furnaces, but as the temperature required for the reaction is exceedingly high, it was difficult to obtain a retort which would stand the heat. But by arc heating the walls of the retort can be kept comparatively cool. By means of the process just mentioned the Electrical Construction Company manufactured, in 1893, about 320 lbs. per day. At the present time the Oldbury Chemical Company, at Niagara, manufacture about 3,200 lbs. per month, and probably Messrs. Albright and Wilson, of Oldbury, turn out a still larger quantity (exact figures are not available). Dr. Herman Hilbert and Albert Frank patented an electrical process: a metallic phosphate was heated with carbon, and beside phosphorus a carbide of the metal was obtained. Thus, with calcium phosphate and aluminium phosphate respectively, the reaction is as follows:—

$$Ca_3(PO_3)_2+4C=3CaC_2+2P+8CO.$$
$$4AlPO_4+19C=Al_4C_3+4P+16CO.$$

That is to say, in the one case calcium carbide, and in the other aluminium carbide, is produced. The process was worked on a commercial scale by the Compagnie électrique du phosphore of Paris, who put up works at 'Chatelaine, near Geneva. But, notwithstanding the fact that such a useful by-product as a carbide was obtained, the process was not a commercial success, and after a short time the works had to close down. The latest process, that of Louis Dill, is electrolytic, as distinct from electrothermic. In this case phosphoric acid, with which is mixed a certain proportion of carbon, is directly electrolysed. This process can be worked continuously, whereas in the electrothermal processes, the operation has to be interrupted for recharging.

In *Metallurgie* 7, 435, W. Borchers discusses the advantages of electrical methods of smelting and refining copper. In the electric furnace, the finest calcined ore, and even ore dust, can be smelted without having first been briquetted. The ore itself may be employed as a resistance material, by being placed in the direct path of the current, on a long hearth, or else in a deep pan, so that the reactions between the sulphides and oxides and the slag formation may be completed without the disturbing influence of large quantities of combustion gases—such as is the case in the ordinary furnaces. The reactions take place, and are completed, in the molten mass; the gaseous products escape, but their amount, compared with the large quantities which escape in the reverberatory furnace, is small. The dust problem is very much simplified and the loss through volatilisation is very much minimised. Another great advantage is the freedom of the slag from copper; in fact, there is so little copper left in it, that it can be thrown away. The working of complex ores is also very much simplified by using the electric furnace.

SUN AND WIND MOTORS

AT the concluding meeting of the Engineering Section of the British Association at Sheffield, a remarkable Paper was down for reading by Prof. R. A. Fessenden on the "Utilisation of Solar Radiation, Wind Power, and other Intermittent Natural Sources of Energy." The Paper, which was, however, not read in full at the meeting, deals first with methods of power storage. Storage batteries could not be used in the scheme described on the score of expense. Experience had shown that storage capacity for at least two weeks was necessary, and the cost of the battery was estimated at £140 per h.p., the interest on which would be more than the cost of producing the power by steam plant. Hydraulic storage was therefore decided upon, and a scheme was gone into in detail with two tanks, one at the surface and the other forming an excavated chamber at the foot of a shaft 1,000 ft. deep, and it was stated that from actual tender the cost would work out at £7 10s. per horse-power for a fortnight as against £140 for the battery. A storage efficiency of 85·5 per cent. is claimed for the hydraulic method, using Pelton wheels with 1,000 ft. fall as against 65 per cent. for the battery. The pumps, turbines, &c., for a 3,000-h.p. plant were given at £2 10s. per h.p., and the total cost of storing the h.p. per annum was worked out as 13s. for the hydraulic method against £26 for the battery, taking 4 per cent. interest and 4 per cent depreciation.

There were two main sources of power available, solar radiation and wind, as in general the rise and fall of the tide was too small to be commercially applicable. Experiments in Central Europe had shown that 4 to 6 million kw. hours were actually available per 100 sq. metres per annum. For the north of the United States the figure was 5 to 7½ million, and for the arid south-western States from 10 to 15 million. These work out to from 4 to 10 per cent. of the maximum radiation as calculated from Langley's constant.

Experiments made at Brant Rock had shown that a windmill 300 ft. in diameter would be capable of delivering on an average during the entire year 800 h.p., a figure about 30 per cent. higher than that obtained by experiments in Denmark, probably on account of the greater height of the tower. In practice, an equivalent number of smaller windmills would be used.

To utilise solar radiation, a solar tank was used containing water which was heated until the steam reached approximately the pressure of the atmosphere. The steam drove a low-pressure steam turbine. A working temperature of 100° C. was chosen because with the steam at atmospheric pressure the transparent top of the chamber containing the working fluid could be made very thin. The fluid flowed in a thin stream across the bottom of the tank, and the thickness of the stream was varied automatically with the amount of radiation received. The working fluid contained a small amount of bichromate of potash. The glass forming the transparent covering contained a small amount of sulphate of iron, to make it reflecting for wave-lengths corresponding to those emitted by the heated water, while remaining fairly transparent to the radiation from the sun. The thermodynamic efficiency of the system was approximately 15 per cent., and it was anticipated that approximately 10 per cent. could be obtainable on the shaft of the steam turbine.

The estimated costs of the plant per h.p. are given as follows:—Solar tank, £2; turbine and condenser, £5; dynamo, £3. Adding the costs of the pumps, Pelton wheels, and reservoirs, the total first cost is £20 per h.p., or £1,143 per annum for capital charges. The assistance of a windmill would cheapen power production and improve the efficiency by evening up to load. With a 200 sq. metre solar tank and an 800 kw. windmill plant, the author estimates that an average output of 1,500 kw. could be obtained at a cost of £1 10s. per h.p. per annum.

The above figures referred to average conditions, but the first plant that had been erected had taken advantage of an existing shaft of a copper mine and worked-out chambers for the lower reservoir; again the solar radiation was more than double the value given above. Some existing pumping plant was also available. In the concluding portion of the Paper the following comparative figures for cost of power per h.p.-year are given:—Steam, £4; gas, £3; water power at Niagara, 15s.; from intermittent natural sources, 18s. (this figure is presumably based on the author's experiments, and not on the estimate given above); water power, exceptionally favourable conditions, 10s. Finally, it is suggested that although England is not well situated as regards solar power, more than sufficient power could be obtained to supply all the factories, lighting plants, and railways in Great Britain by excavating reservoirs on the top of the cliffs, mounting windmills there, pumping the water up from the sea to the upper reservoirs and letting it run back through turbines and dynamos placed on the beach.

The Incorporated Institution of Automobile Engineers.—This Institution has moved its offices from Caxton House to a suite on the ground floor of No. 13, Queen Anne's Gate, where council meetings will be held and a reading-room provided. At the opening meeting of the session on October 12th, Mr. F. W. Lanchester will give his presidential address.

Engineering Exhibition at Olympia.—In consequence of the success of the Naval, Mercantile Marine and General Engineering Exhibition, now being held at Olympia, it has been decided to hold a similar exhibition under the same management in 1913.

The Electrical Standardising, Testing and Training Institution.—A new prospectus for the coming session is to hand from the Electrical Standardising, Testing and Training Institution (Faraday House, 62 to 70 Southampton Row, W.C.), giving full information as to the arrangement of the courses for the term now about to commence. The next term opens on September 26th, and the entrance examination will be held at Faraday House on 23rd inst., at 11 a.m. Full particulars can be obtained from the secretary.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

SHIP FITTINGS.—A leaflet from Simplex Conduits, Ltd (113 Charing Cross Road, London, W.C.) illustrates a number of cast brass lamp brackets and ceiling fittings for ships' cabins.

DRY CELLS.—Siemens Bros. & Co., Ltd. (Caxton House, Westminster, London) have sent us the August, 1910, issue of their catalogue of dry cells. The notes on the use of dry cells for ignition purposes have been re-written, and new illustrations to scale have been inserted.

PYROMETERS.—Another new list from Siemens Bros. & Co., Ltd., gives particulars and prices of optical pyrometers for measuring furnace temperatures above 600° C. Two patterns are described; the standard pattern with cast-iron or wooden tripod stand, and a portable pattern.

ADVERTISING LITERATURE.—The Electric Supply Publicity Committee (Moorgate Court, Moorgate Place, London, E.C.) have issued some further publicity matter for the use of supply undertakings, including an electric heating poster in colours, a six-page booklet extolling the advantages of electric radiators, a pamphlet emphasising the economy of electric driving of machinery, and two coloured postcards with a similar aim.

The Marylebone Electricity Department has secured several pages for the purpose of advertising electricity for lighting and power, in an illustrated guide to the Borough, published under the auspices of the Council. A brief description of the electricity undertaking, with a photograph of the interior of the generating station is also included.

D.-C. MOTORS.—The Union Electric Co., Ltd. (Park Street, Southwark, London, S.E.) have issued a new list of D.-C. shunt-wound motors of from ¼ to 50 h.p. Illustrations of various patterns of machines and separate parts are given.

TRAMCAR CONTROLLERS.—A copiously illustrated pamphlet from Messrs. Dick, Kerr & Co., Ltd. (Abchurch Yard, Cannon Street, E.C.) describes the latest form of the Dick Kerr metallic shield blow-out controller. The action of the blow-out solenoid is effectively shown by diagrams. The novel feature of the braking type of controller is the combination of the brake and power cylinders on the same shaft. This eliminates the mechanical device previously necessary for throwing over a special brake cylinder when passing from the off-position on to the brake notches. The power handle is now made non-removable, and the motor cut-out switch now consists of a knob projecting through the back of the controller at the top, which can only be worked by the reversing handle. This in a four motor controller is arranged with four positions to cut out any pair. Particulars of controllers for heavy railway service are also given.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

TELEPHONES.—An abbreviated illustrated list is to hand from the Sterling Telephone & Electric Co., Ltd. (200, Upper Thames Street, London, E.C.). This covers all classes of telephones, switchboards, and accessories for telephone installations.

LIMIT GAUGES.—The Newall Engineering Co. (Peter Hooker, Ltd., Walthamstow, London, E.) have issued a new edition of their illustrated catalogue of Newall gauges, and will forward copies gratis on application. The various patterns and sizes of limit gauges are listed and their purpose and use described. Straight edges, internal and external micrometers, screw gauges, and measuring rods, surface plates, and measuring machines are also listed. A price list of metric sizes is appended.

LIGHTING FITTINGS.—An illustrated pamphlet from the Benjamin Electric, Ltd. (1a Rosebery Avenue, London, E.C.) gives particulars and prices of Benjamin wireless cluster fittings and lighting specialities, including waterproof holders for high candle-power lamps, canopy grouping switches, weatherproof fittings, &c.

CENTRIFUGAL PUMPS.—Messrs. Ernest Scott & Mountain, Ltd. (Close Works, Gateshead-on-Tyne) have published a new pamphlet giving an illustrated description of their centrifugal pumps. Particulars are given of various patterns, both horizontal and vertical, and for high, medium, and low lift. Some useful hydraulic tables and formulæ are included. The illustrations and diagrams show clearly the action and construction of these pumps.

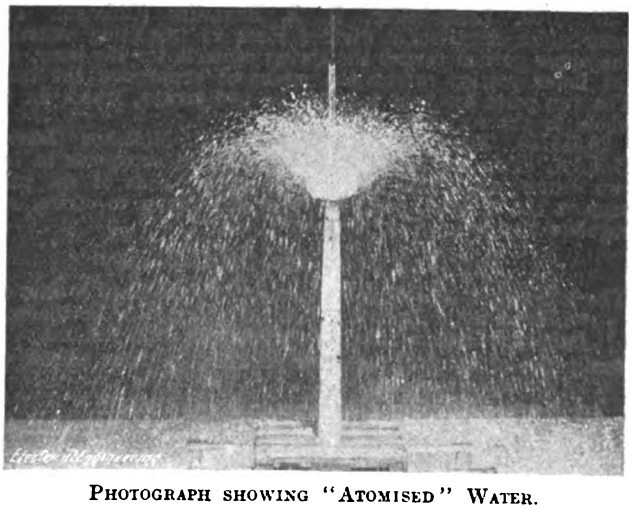
TRANSFORMERS.—A leaflet from the A.E.G. Electric Co., Ltd. (121 Charing Cross Road, London, W.C.), gives an illustrated description of a transformer switchcase suitable for operation by unskilled persons, and especially adapted to mines. No live parts are exposed, and interlocking arrangements are provided. The transformer is of the oil-immersed type.

POCKET LAMPS, etc.—A new list from G. Braulik (8, Lambeth Hill, Queen Victoria Street) contains particulars of a series of pocket lamps with refillable batteries and metal filament lamps and other portable lamps and novelties.

BOILER-HOUSE TESTING APPARATUS.—Messrs. Sanders, Rehders & Co., Ltd. (108 Fenchurch Street, E.C.), have sent us a copy of their "Sarco" Bulletin, which contains a quantity of interesting reading on the subject of boiler-house practice and the combustion of coal, emphasising the economies that can be obtained by the use of suitable CO_2 recorders and other testing appliances, in which they are specialists, and giving some useful information regarding the use of this class of apparatus.

TELEPHONE APPARATUS.—A new leaflet from Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster), gives particulars of a compact "instrument protector" for protecting telephone instruments against damage by lightning discharges and high-tension currents, as well as from "sneak-currents," which, though only small, may, by flowing for a prolonged period, do serious damage. The apparatus comprises two pairs of carbon-block lightning arresters, two non-arcing line fuses, and two safety fuses, mounted on a porcelain base and enclosed in a cover.

ELECTRIC SYRENS.—Another list from Messrs. Siemens Brothers & Co. deals with a new form of motor-driven syren which they are introducing for factories, fire-alarm signals, and other purposes where a clear, loud, distinctive signal is required. These can be fitted with an attachment for giving sharply defined signals, consisting of an electromagnet which opens and closes the air inlet as the motor is switched on or off.



OZONE GENERATORS.—An illustrated pamphlet from Ozonair, Ltd. (96, Victoria Street, Westminster, London, S.W.), describes laboratory apparatus for generating ozone in various degrees of concentration for research and other purposes. Complete outfits for treating liquids, &c., and capable of producing from two to 120 litres of pure, dry, ozonised air per minute, are also listed. The principle and construction of the Ozonair generators were described in ELECTRICAL ENGINEERING, April 14th, 1910, p. 241.

TANTALUM LAMPS.—We have received from Messrs. Siemens Brothers Dynamo Works, Ltd. (incandescent lamp and fittings department, Tysson Street, Dalston), copies of two new show-cards which they are issuing—one of the well-known satisfied consumer design, and the other containing reproductions of some of their other advertising matter.

ELECTRIC DRIVE OF SPINNING MACHINERY.—A leaflet from the A.E.G. Electric Co., Ltd., illustrates a three-phase collector motor direct-coupled to a ring spinning machine, with automatic speed regulation through brush adjustments.

"CASCADE" COOLING TOWERS

MESSRS. RICHARDSONS, WESTGARTH & CO., LTD. (Hartlepool), have for some time been experimenting with a view to obtaining the maximum possible cooling effect of the air in cooling towers, and have now on the market an improved form known as the "cascade" cooling tower, of which a number of examples are already in use. The principle on which it works depends upon the way in which water can be "atomised" by allowing a solid jet to fall on a suitable platter in the manner shown in the illustration, and thus

PHOTOGRAPH SHOWING "ATOMISED" WATER.

to offer a very large surface to the air. The water is delivered to the tower in troughs, from which it is distributed by pipes arranged in rows. These pipes discharge the water in jets on to sprayers, which are so formed that the water rebounds in an upward direction in a finely divided state, and before it can attain a high downward velocity it is caught on diagonally placed collecting planes, which are constructed as a series of parallel steps separated from each other for the passage of air, so that the water falls from one step to another, and finally flows into another set of receiving troughs.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 15th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

13,728/09. **Enclosed Arc Lamp.** F. W. SCHUER (London). All parts of the lamp in communication with the inner globe are hermetically sealed, with the exception of a long narrow outlet of 1/16 in. bore, for the release of the generated gases. Entrance of oxygen into the globe is prevented and the combustion of the electrodes reduced. One figure.

19,387/09. **Flame Arc Lamp.** S. C. MOUNT and BECK FLAME LAMP, LTD. This specification describes mechanism for multiple carbon lamps, to move the swinging carbon of the second pair of electrodes nearer its fellow electrode than is the case with the other pair when the first pair is consumed, so that the arc is struck between the fresh pair. For several pairs of carbons the mechanism is arranged so that only one pair is brought together each time the striking mechanism is operated. Two figures.

19,496/09. **Electric Drive.** W. G. BAMBRIDGE (Kettering). A mechanism suitable for use with motor-driven drills comprises a countershaft supported by rotatable eccentric bushes, so that by rotating the bushes the position of the shafting and the tension of the driving belt can be altered. The bush is provided with a lever, and has ratchet teeth engaged by a pawl to prevent back movement. The driven pulley is mounted loose on the shaft, and a conical collar on the shaft is pressed into the bore of the pulley by springs. This allows the pulley driving the countershaft to slip and rotate when the load exceeds a predetermined amount. Three figures.

23,351/09. **Insulating Material.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*). Talc or clay is mixed with a compound of titanium and a silicate binder, and the product is compressed and fired at a temperature of 900° to 1,500° C. The presence of the titanium has been found to increase the strength and refractory qualities of the material.

25,719/09. **Plug Connector.** N. HOSGOOD (Dublin). The one or more sets of three pins of the plug, and the corresponding holes of the socket are arranged at the angles of equilateral triangles, and may be connected in three different ways. Marks are made on plug and socket to indicate the particular connection made. Four figures.

26,250/09. **Submarine Telephone Cables.** SIEMENS BROS. & Co., LTD., and W. DIESELHORST. The Pupin or inductance coils of submarine telephone cables are wound with more or less hygroscopic material, and to prevent moisture being gradually absorbed by this, the coils are provided with a light sheathing of impermeable material, such as tin or lead foil. This sheath may be placed between the coil itself and the gutta-percha protecting tube. Two figures.

27,208/09. **Lamp-holder.** R. B. BENJAMIN (Chicago). This lamp-holder comprises a divided block of insulating material; the upper portion carries the spring contacts for the lamp, and the lower portion carries the means of supporting the lamp. The two parts are held together by two screws, which fix the whole to the reflector. Four figures.

28,555/09. **Magazine Arc Lamp.** L. M. MCBRIDE (Denver, U.S.A.). Two magazines deliver carbons in succession to feed two converging tubes. Stops at the lower ends of the tubes support the carbons, and the tubes are swung to strike, and regulate the arc. Four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: KÖNECKE [Three-phase lamp] 6,868/10.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: MILLER [Lead jointing] 9,043/10; ETTLINGER [Underground cable conduits] 10,054/10.

Dynamos, Motors, and Transformers: SIEMENS BROS. DYNAMO WORKS, LTD. (*Siemens-Schuckertwerke Ges.*) [Voltage regulation of machines] 3,915/10; SIEMENS BROS. DYNAMO WORKS, LTD., and PICKERING [Armature windings] 11,896/10.

Electric Ignition: DELAGE and WOOG [Ignition of gas burners] 17,486/09; WECKERLEIN & STÖCKER [Contact-breakers for dual ignition system] 6,033/10.

Electrometallurgy and Electrochemistry: COWPER-COLES [Electroplating] 20,057/09; JOHNSON (*Badische Anilin & Soda Fabrik*) [Production of long continuous arcs] 20,129/09 and 22,715/09; SALTPETERSÄURE INDUSTRIE GES. and PAULING [Manufacture of nitrates] 9,884/10.

Incandescent Lamps: BOOTH and BOOTH [Connection of lamps in series] 25,288/09; WOLFRAM LAMPEN A.-G. [Supports for metal filaments] 6,397/10.

Instruments and Meters: STROMBERG and WILLIS [Counting trains for meters] 2,275/10; CHAMBERLAIN & HOOKHAM, LTD., and SPRAGUE [Prepayment meter] 8,922/10.

Switchgear, Fuses, and Fittings: SOC. DU GAZ DE PARIS [Illuminated signs] 29,502/09; HIRST and TAYLOR [Conduit wiring system] 29,953/09; ADAMS MANUFACTURING Co. (*Cutler Hammer Manufacturing Co.*) [Starters for polyphase motors] 7,318/10; J. STONE & Co. and DARKER [Change-over switches for train lighting systems] 7,469/10; NOVAK [Circuit-breakers for overhead conductors] 7,799/10; LUNDBERG [Switches] 8,418/10.

Telephony and Telegraphy: MARCONI and MARCONI'S WIRELESS TELEGRAPH Co., 20,230/09; BRITISH RADIO TELEGRAPH & TELEPHONE Co. and BALSILLIE, 24,388/09; ROMER [Intercommunication telephones] 28,462/09; POTTS [Automatic telegraph transmitter] 15,123/10.

Traction: SPENCER and DAWSON [Tramcar trucks for varying gauges] 19,655/09; BROOKS [Electrical starting of motor-cars] 19,747/09; SNOW and RADLEY [Signalling] 9,164/10; MARKS (*Hill*) [Brake-shoes] 9,344/10; SIEMENS BROS. & Co. (*Siemens & Halske A.-G.*) [Signalling apparatus] 14,355/10.

Miscellaneous: REES [Centrifugal pumps] 15,084/09; LAKE (*Fried. Krupp A.-G.*) [Magnetic separators] 17,459/09; CHARLES [Therapeutic garments] 20,408/09; WALTON and SMITH [Exhaust steam plant] 27,200/09.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: GALVAO [Vapour lamps] 19,671/10.

Electrometallurgy: SOC. ANON, ELECTRO-METALLURGIQUE (Procédés Paul Girod) [Polyphase furnace] 3,421/10.

Telegraphy: SIEMENS & HALSKE A.-G. [Signalling apparatus] 13,985/10.

Traction: SIEMENS & HALSKE A.-G. [Safety device] 18,670/10.

Opposition to Grant of Patents

11,060/09. **Arc Furnace for Treating Gases.** G. W. JOHNSON (*Chemische Fabrik Griesheim-Elektron*). As the result of opposition, the right to a patent on this application has been surrendered. The specification covers a furnace in which a long horizontal arc is drawn out, the gases being blown down on to the arc at a sharp angle from a series of slits arranged above it in the manner of louvres.

10,802/10. **Prepayment Meter.** W. V. PALMER. Opposition has been entered to the grant of this patent, which covers a device for use in prepayment meters to prevent the insertion of too many coins at one time, which causes jamming of the mechanism.

Application for Revocation

18,628/08. **Electric Ignition.** A. M. LOW. Application has been made under Section 26 of the Patents Act for the revocation of this patent, the applicant having failed to oppose the grant of the patent. The patent covers a sparking plug in which one electrode is cup-shaped, and the other a point at the axial centre of the cup.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

21,262 of September 26th, 1896. **Centrifugal Drying Machines.** R. WILLIAMSON. The motor armature is fixed to the top of the vertical shaft of the suspended cage, and the field system is suspended so that it receives the same oscillatory movements as the rotating shaft and armature, but is prevented from rotating by fixed pins.

21,548 of September 29th, 1896. **Telegraph Punching Machine.** W. L. WISE (*C. L. Buckingham, U.S.A.*). This patent covers an electromagnetic apparatus for perforating a strip of paper for use in a telegraph transmitter, with groups of holes, each representing a letter.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: W. P. THOMPSON (*Berliner Maschinenbau-A.-G.*) [Polyphase transformer cores] 12,688/02; L. LOHNER and F. PORSCHE [Field-magnet coils] 12,694/02.

Electrometallurgy, &c.: M. OTTO [Ozonising apparatus] 12,521/03.

Incandescent Lamps: C. D. ABEL (*Siemens & Halske A.-G.*) [Manufacture of tantalum filaments] 12,157-8/02.

Instruments, &c.: L. B. ATKINSON [Maximum-demand indicator] 11,235/01.

Traction: N. A. CHRISTIENSEN [Air brakes] 10,972/01; L. KRIÉGER and COMPAGNIE PARISIENNE DES VOITURES ELECTRIQUES (PROCÉDÉS KRIÉGER) [Petrol-electric system] 25,175/05.

Miscellaneous: H. HAWTHORN [Fire alarm] 12,579/05; A. TAYLOR [Fire alarm] 11,275/05.

Digitized by Google

MARINE PROPULSION

AT a meeting of the Institute of Marine Engineers held at the Naval and Engineering Exhibition, Olympia, London, on Saturday, a Paper was read by Mr. J. Lecoche describing the use of his system of magnetic frictionless gearing in connection with the combination of a reciprocating engine and an exhaust-steam turbine for marine propulsion. As an example, the case of a gear for a 300-h.p. 3,000-r.p.m. exhaust-steam turbine was chosen. The turbine is coupled to the main propeller shaft, driven by the reciprocating engine, and running at 75 r.p.m., through a magnetic worm gear comprising a cast-steel field magnet with laminated pole-pieces, and a worm and wheel also laminated. The wheel has a hollow rim made up of sprockets, having the same angle, width, and pitch as the threads of the worm opposite which they move with a clearance of about 0·25 in. There is a slight advance of the worm threads under load, and the wheel is dragged round unless the load is sufficient to cause it to fall out of step. The field-coil losses for such a gear are given as 1,200 watts, or about 1 per cent. of the power transmitted, and the losses through hysteresis and eddy-currents in the teeth about 4 per cent., giving an efficiency of 95 per cent., excluding the small friction losses of the bearings. The weight of the complete gear is given as 11 tons, and this is compared with the estimated weight of 30 tons for an electrical transmission employing a 250-kw. 3,000-r.p.m. dynamo and a 300-h.p. 75-r.p.m. motor.

Two other Papers were read. One, by Mr. W. P. Durtnall, reviewed the history of the internal combustion engine, and briefly referred to the advantages to be gained by its use in connection with electrical transmission for marine purposes, and the other, by Mr. W. G. Gibbons, described the Brown telemotor, a hydraulic device for operating ships' steering gear.

ANSWERS TO CORRESPONDENTS

Correspondents must in all cases send their names and addresses with their queries, and, if they do not desire the reply to be published after their own name, should add a "nom de plume." Questions should be addressed to The Editor, ELECTRICAL ENGINEERING, *203–6 Temple Chambers, Temple Avenue, London, E.C. The Editor will not guarantee to answer all questions in this column, and the enclosure of a stamped and addressed envelope is therefore desirable. Books recommended will be forwarded on receipt of a remittance for the amount mentioned.*

S. M.—No.

Z.—Certainly.

DOUBTFUL.—Ask the Supply Co.

STUDENT.—"Electric Motors," by Hobart. Post free, 18s. 6d.

WIRELESS.—"Radiotelegraphy," by Monckton. Post free, 6s. 4d.

Q. Q. Q.—We cannot prescribe electrical treatment in this column. Consult a medical man.

ANON.—(1) It is a departure from the regulations and current practice. (2) We are publishing your letter.

SEVEN DIALS.—No, you cannot expect the supply people to pay you if the meter registers backwards.

R. L. M.—We know very little of the firm you mention, and should recommend you to obtain quotations from two or three of the firms in the "Trades Directory" on our last advertisement page.

"CONTRACTOR SMITH."—The Corporation are quite within their rights to insist that the installation should be wired in two separate portions for connection to their three-wire system if the maximum current exceeds a certain amount. The two sets of main switches and fuses should be at least 6 ft. apart.

COUNTRY COUSIN.—A fuse and heat coil are not necessary for your short overhead telephone wire, as there are neighbouring buildings and trees at a higher elevation. There will be no harm, however, in using "window terminals" with spark gaps at the points of entry of the line; the earth terminals of these may be connected to the water-main by a bare wire.

AN ENQUIRER FROM MANCHESTER.—We hope to be able to publish shortly some particulars of the machine you mention. There is no competition between the British and foreign firms to build the largest motor in existence, and it is only for very special purposes, such as rolling mills, that single motors of 1,000 h.p. and over will be required.

SCEPTIC.—It is quite true that metal filament lamps consume about 70 per cent. less energy than carbon lamps *for the same candle-power*, but as your circuit is 200 volts, you will have to be content with replacing the 16-c.p. lamps by 30-watt metal filament lamps, which will consume half the energy, but will give about 25 c.p., as this is the smallest size at present on the market. Replacing the 8-c.p. carbon lamps by 30-watt metal filament lamps will not reduce the consumption, but will give you three times the light.

SURFACE-CONTACT TRAMWAYS AT TORQUAY

THE arbitration commenced in London on Monday of last week to settle a difference whether the Torquay Tramways Co. were to be allowed to replace their surface-contact system of electric traction by the overhead system was continued on Wednesday last week, and concluded on Saturday. A report of the previous proceedings was given in our last issue. The arbitrator reserved his award.

Mr. W. H. PATCHELL, called on behalf of the Tramways Company, gave evidence to the fact that the number of live studs on the Torquay system was increasing; it had been an average of 28 per month during 1908, and for the first seven months of this year the average was 47 per month. He did not think it possible to eliminate the faults of the Dolter system. The cost of repair and maintenance was very high, and experience showed that it would increase in the future. It would be most difficult to give a satisfactory service if the Torbay road route were on the surface-contact system while the rest of the Torquay system and the extension to Paignton were on the overhead system, as it would necessitate a shuttle service on the Torbay route, with considerable inconvenience to the public. He considered that the Company had done their utmost to make the system a success. The new stud proposed by Mr. Mitchell was impracticable. He would not recommend the G.B. system, and he was certain that the Lorain system would be objected to in Torquay.

This concluded the case for the Company.

Mr. C. E. C. SHAWFIELD, Borough Electrical Engineer of the Wolverhampton Corporation, was then called for the Torquay Corporation to give evidence of the efficient working of the Lorain system in Wolverhampton. There are now 21¾ miles of single track on this system in Wolverhampton, 12 miles of which have been in operation for nearly nine years, and the system, he said, had given every satisfaction. The cost of the electrical equipment per mile of single track was £1,800 against an estimated £1,000 per mile for the overhead system. The operating costs were now 6·4. per car-mile, or 9·37d. including all capital charges. They had had very few cases of live studs, and the system was approved indefinitely by the Board of Trade.

Mr. VESEY KNOX, interposing, mentioned that the Lorain Co. had quoted a figure of £2,680 per mile of single track for equipping the Torquay system, and without any guarantee.

In reply to a question concerning the abandonment of the live stud indicating device, Mr. Shawfield stated that they had found that above a speed of about 8 miles on hour the bell rung continuously, as it took some considerable fraction of a second for the stud switch to open. It was difficult to give any figure for the number of live studs reported, as many gave no reading on a low-resistance voltmeter, while registering a considerable pressure on an electrostatic or high-resistance voltmeter. The average number giving any reading at all over a period of seven years was two per mile of track per annum, and about half of these only were really "live." It was true that 109 live studs were reported in 1904. In his opinion, the reason why the Lorain system had not been adopted elsewhere was the action of the Press some eight years ago in carrying on a campaign of calumny against all surface-contact systems.

Mr. W. A. LUNTLEY, General Manager of the Wolverhampton Tramways, confirmed Mr. Shawfield's remarks as to live studs, stating that no serious accidents had occurred, but that about £40 per year was paid for compensation in respect of accidents to horses. No complaints had been received with regard to the projecting of the contacts above the roadway. The net profit of the system for 1909 was £6,334, and they had accumulated a reserve fund of £32,000. The capital of the system was £248,000.

Mr. STANLEY CLEGG, Electrical Engineer to the Lincoln Corporation, gave evidence as to the satisfactory working of the G.B. system there. There was a guarantee that the current consumption would not be more than 1·3375 units per car-mile, and for the year to March 31th, 1910, it was 1·075 units per car-mile. The detector on the cars had never failed to indicate a live stud, and there had not been one accident during the five years the 3½ miles at Lincoln had been working. The working expenses for the year to March, 1910, were 0·54d. per car-mile less than on any other system of municipal tramways. In cross-examination, Mr. Clegg admitted that the number of live studs was increasing, and that the cost of maintenance had gone up every year. Nevertheless, they had a permanent licence from the Board of Trade.

Mr. W. M. MORDEY, who was called in by the Corporation and had reported on the working of the Dolter system at Torquay (ELECTRICAL ENGINEERING, July 28th, p. 496), dealt at length with his proposals to improve the system. The whole of the trouble has been with the stud mechanism, and the main part of his evidence was intended to demonstrate the advantages of a stud invented by Mr. E. A. Mitchell, at one time Chief Engineer to the National Electric Construction Co.

Digitized by Google

It was subsequently pointed out by the Company's representative that the patent in question was taken out in 1907, before Mr. Mitchell left the Company, and that Mr. Mitchell had never drawn the attention of the Company to it. Mr. Mordey said he was surprised that the patent had not been worked before, because it certainly covered a number of details which would overcome the difficulties at Torquay. It may be explained that the present stud-boxes consist of an inner and outer vessel, the outer containing a heavy oil to keep out water, and the inner a thinner oil, in which the switch contact works. The main advantages claimed for the Mitchell stud are that only one vessel is used, so that the switch contact works in a much larger space, rendering carbonisation of the oil less frequent owing to the greater quantity of oil, and the break of the switch is greater and better, and that the contact when closed is better owing to the magnetic action being more powerful. Mr. Mordey detailed a large number of defects now existing which would be remedied by the abolition of the inner vessel, but as the Company had spent about £20,000 in working Mr. Mitchell's inventions on the Torquay tramways, they refuse absolutely to look at any others. It was pointed out to Mr. Mordey that all the advantages which he claimed for the single vessel did not show themselves when the Company used such a contrivance, and that it was for this reason that a double-vessel arrangement was adopted. The Company's officials and Mr. Mordey were similarly diametrically opposed on the question of the oil in the boxes. Mr. Mordey felt convinced, from experience with oil switches in power-houses, that a satisfactory oil could be found, but experience at Torquay had convinced the Company that no oil existing can be satisfactory, in spite of the apparent freedom from trouble on this head at Hastings. Mr. Mordey did not consider the electrical losses on the Torquay lines extravagant, viz., 11·9 per cent. In fact, he should consider this quite good even for a trolley system. On the L.C.C. conduit lines, he said, there was a considerable leakage. Mr. Mordey also strongly recommended a patent live stud detector invented by Mr. Mitchell, but it was interposed on behalf of the Company that this identical device had been tried at Torquay under Mr. Mitchell's supervision, and admitted to be a failure. On the question of maintenance, it was claimed that the Torquay lines compared favourably with overhead lines. In Mr. Mordey's report, however, he complained that the system had not been maintained efficiently. The Arbitrator pointed this out, and suggested that if more money was spent on maintenance, as was suggested in the report, the comparison would not be so favourable.

Mr. VESEY KNOX cross-examined Mr. Mordey at great length, and pointed out that the proportion of live studs at Hastings was greater than at Torquay. He also put it to Mr. Mordey that the greater magnetism in the Mitchell stud would result in its remaining magnetised after the car had passed, and ringing the detector bell, whether it was alive or not, but Mr. Mordey said this could be avoided by using materials for the stud of smaller retentiveness. Specimens of oils were produced which it was claimed would prevent water getting into the boxes. Mr. Knox put it forward, however, that one of these very oils had actually been tried at Torquay, and had failed, and that Mr. Swinburne himself knew of no oil that would do this effectively. Mr. Knox also referred to a statement made by Mr. Shawfield in his evidence, that he would hesitate to use a switch of this character in oil.

On Saturday the proceedings were concluded. Mr. F. S. Hex, Town Clerk, detailed the negotiations between the Corporation and the original Dolter Company, which led up to the construction of the tramways. At present, he said, the travelling on the cars was very easy, the service was a good one, and the gradients of the town were taken well by the cars. The Corporation was quite satisfied with the system, and held the view that the general conditions of the undertaking were in striking contrast to any overhead trolley system. There was little doubt, in the opinion of the Corporation, that the system could be kept in a state of repair which would meet the objections of the Board of Trade. Indeed, it was on the strength of assurances from the Company that they would make further efforts to improve the Dolter system that the Corporation gave their sanction to the Paignton extension. An important part of the Town Clerk's evidence was the production, at the request of the Company, of an offer on the part of the Corporation to agree to the introduction of the overhead system provided the Company gave certain guarantees to construct additional lines. This offer, which was made "without prejudice," was refused by the Company, owing to the difficulty of raising the necessary capital.

The Mayor of Torquay said the general feeling of the borough was against a change, whilst Councillor Pike, Chairman of the Tramways Committee, expressed the view that rather than have no tramways on Torbay Road, he would agree to the installation of the overhead. On the other hand, the Mayor would rather have no tramways at all than have the trolley system. Some further local evidence concluded the case for the Corporation.

The arbitrator, who paid a visit to Torquay on Monday, reserved his award.

LOCAL NOTES

Austria: *Strike.*—According to Reuter telegrams, about 300 employees of the Municipal Electrical Works at Lemberg have gone on strike. As a consequence the electric tramway service is suspended.

Ayr: *Tramway Accounts.*—The net profit for the past year's working amounts to £2,491. The sum of £1,962 is carried to depreciation, and £529 to relief of rates. The number of passengers carried—namely, 3,588,628—is a decrease of 21,909. The traffic receipts—namely, £15,007—show a decrease of £74. The Manager reports the fitting of the water-car with a track brake to which has been attached blocks of a very hard substance known as alundum blocks, which, when screwed down to the rail, effectively grind out corrugations.

Electricity Accounts.—After meeting interest and sinking fund charges, the accounts of the Electricity Department for the past year show a surplus of £2,444, which is an increase of £120 over the previous year. The sum of £200 has been transferred to relief of rates and the remainder to reserve fund. Mr. R. Marshall, the Borough Electrical Engineer, recommends that all future surplus revenue should be placed to reserve until this fund reaches a sum sufficiently large to ensure the financial stability of the undertaking.

Bath: *Electrical Trades Union.*—A meeting was held on Friday in the Foresters' Hall with the object of forming a local branch of the Electrical Trades Union. There are about a hundred electrical workers in Bath, but very few attended the meeting. Eventually the idea of establishing a local branch was abandoned, and the Bath workers were urged to join the Bristol branch.

Belfast: *Tramway Extensions.*—The Tramways and Electrical Committee have decided, in connection with the proposed new line from Antrim Road to Old Cavehill Bridge, to omit from the sub-committee's report the recommendation to purchase the interests of the owners of the Old Cavehill railway, which lies to the north of the proposed extension.

Bradford: *Town Hall Wiring.*—The Bradford Electrical Co. are carrying out the work of re-wiring the old portion of the Town Hall. The installation includes the fitting of 379 lamps. In addition, an internal telephone system and electrically controlled clocks, are to be installed, these two latter portions of the work being carried out by Messrs. Steinthal & Boydell.

Trolley Omnibuses.—The Tramways Committee have approved a recommendation of the Sub-Committee to purchase two trolley omnibuses for running along the route from Sticker Lane to Dudley Hill.

Canada: *Dawson City.*—The directors of the Northern Light, Power & Coal Co., Ltd., have received a cablegram stating that their power-house at Dawson City has been completed, and that current has been successfully transmitted over 44 miles of transmission line.

Cardiff: *Telephone Exchange.*—The new telephone exchange, which has been at work for some time, was formally inaugurated last week. A full description of the equipment appeared in ELECTRICAL ENGINEERING, Vol. IV., page 721, December 3rd, 1908.

Dalkey: *Electric Lighting.*—When the Dublin United Tramways Co. obtained powers to run trams to Dalkey, it appears that the Council refused to grant facilities to the company for supplying electricity. No move, however, has been made by the Council itself in the direction of giving a supply, and complaints are now being made on this ground. The Council are being urged to waive the clause preventing the Tramway Co. from supplying electrical energy.

Eastbourne: *Reduction in Electricity Charges.*—From October 1st the charge for lighting will be reduced from 5½d. to 5d. per unit; for outside arc lamps or incandescent lanterns, from 4½d. to 4d. per unit; and for heating and cooking, from 2½d. to 1½d. per unit. Where there are two or more ordinary meters on a consumer's premises, the charge will be 1s. 6d. each per quarter, instead of 2s. 6d. each.

Edinburgh: *Electricity Department Profits.*—The Town Council have a sum of £7,300 in hand from surplus profits of the electricity undertaking, and are recommended by Sir Alexander Kennedy to devote this to paying off the unpaid portion of the outstanding loan on the plant at the Dewar Place power-house, and to replace it with more up-to-date machinery. The Electricity Committee have decided to recommend this course to be adopted.

Digitized by Google

Leeds: *Trolley Omnibus.*—The Corporation having decided to instal the system of trolley omnibuses in Leeds, the directors of the Mercédès-Stoll system have been inspecting the route from City Square along Whitehall Road to Drighlington.

London: *Hampstead.*—An exhibition of electrical domestic appliances is to be held at the Finchley Road Baths from October 4th to 8th.

Manchester: *Tramcar Building.*—The Manchester Ratepayers Association has expressed to the Town Clerk their doubts as to whether the Corporation have Parliamentary powers to undertake the building of tramcars, as has recently been done. In reply the Town Clerk has drawn attention to the Manchester Corporation Acts of 1897, 1899, and 1900, but the Ratepayers Association retorts that these merely give the power to "provide" cars and not "manufacture" them. This latter communication is to be placed before the Tramways Committee.

Loans without Inquiry.—The Ratepayers Association is also still dissatisfied with regard to the action of the Local Government Board in recently granting a loan of £40,000 for electrical extensions without holding the usual inquiry. A number of letters to the Local Government Board on the matter have carried it no further than a statement by the Board of the purpose for which the loan in question was required, and intimating that in respect of a further loan for £30,000 for a turbo-alternator at Stuart Street powerhouse a local inquiry will be held.

Monkseaton: *New Sub-station.*—The growth of the demand for electric light at Monkseaton has necessitated an increase in the plant of the Newcastle-upon-Tyne Electric Supply Co. in that district. As the district is a high-class residential one, it was necessary to depart from the somewhat plain design usually adopted by the company in its sub-stations, and to build one of a rather more handsome type to suit the æsthetic tastes of the neighbourhood. It is a one-floored building, and will contain a three-phase transformer by Richardsons, Westgarth & Co., which will convert the current from 5,500 volts to 440 volts. It is interesting to note that the power for this new sub-station is supplied from the main station at Carville via the North Eastern Railway Co.'s substation at Cullercoats. The low-tension switchgear is by Messrs. Reyrolle & Co., of Hebburn-on-Tyne.

Newport (Mon.): *Electricity Accounts.*—The electricity accounts for the past year show a profit of £380, compared with a loss of £1,469 in the previous year. Mr. H. Collings Bishop, Borough Electrical Engineer and Tramways Manager, is justly proud of this achievement, as it has been brought about without increase of prices, and a still falling revenue due to metal filament lamps. The total cost per unit, namely, 0·81d., is a decrease of 0·05d. per unit. The total number of units sold was 4,012,909. The load factor was 19 per cent., slightly less than the two previous years; the maximum load was 2,324 kw., and the total connections in 8-c.p. lamps equivalent, are now 187,703. The net profit of £380 is arrived at after meeting interest and sinking fund charges.

Oldham: *Smoke Nuisance.*—Quite a number of complaints have been made from time to time concerning the emission of black smoke from the Electricity Works' chimney. Mr. S. W. Newington, the Borough Electrical Engineer, has been making a large number of experiments with a view to improving the conditions, and on Sunday a test was made using the worst coal he could obtain. The members of the Electricity Committee were present, and expressed themselves satisfied with the result of the test.

Rochdale: *Tramways Inspection.*—The tramways which have been constructed in the Whitworth Valley by the Corporation were inspected on behalf of the Board of Trade last week by Lieutenant-Colonel P. C. Von Donop. The line runs for nearly three miles beyond the Rochdale boundary, and will ultimately be extended to Bacup, linking up Rochdale with Rossendale. The latter line is now under construction.

Sevenoaks: *Electric Lighting.*—The Council last week decided to apply for a provisional electric lighting order. Messrs. Mordey & Dawbarn have prepared a report dealing with the town.

Stirling: *H.T. Wires across Highways.*—The Stirling County Council have approved a proposal by the Scottish Central Electric Power Co. to carry high-tension cables across certain public highways between Denny to Stirling.

Weymouth: *Tramways.*—At the last meeting of the Council the Electric Lighting Committee presented a report proposing an expenditure of £27,000 on a tramway system, to which reference has recently been made in our columns. The scheme has met with such keen opposition from the ratepayers that the Committee withdrew it, and promised to bring out an alternative proposal in a month's time. A postcard poll of the ratepayers ended in a majority of 342 against the Corporation working a tramway system.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Heckmondwike.—Application has been made to the Local Government Board for a loan for electrical extensions.

Ireland.—The Cookstown and Listowel Councils are making inquiries regarding electric supply.

Manchester.—A Local Government Board inquiry will shortly be held concerning a loan of £30,000 for the provision of a turbo-alternator at Stuart Street.

Norwich.—A loan of £18,790 for mains, services, exhaust steam turbine, condenser, balancer, coal elevator, &c., is to be applied for.

Sheffield.—Tenders are invited for a turbo-alternator, exciter, condensing plant, pumps, and accessories, three water-tube boilers, economisers, induced draught fan, steel chimney, &c. Particulars from the General Manager, and tenders by September 30th.

Warrington.—The Local Government Board have sanctioned a loan of £6,257 for plant extensions at the Electricity Works.

MISCELLANEOUS

Hereford.—The provision of an improved electrical equipment is being urged upon the Hospital Committee.

Isle of Thanet.—The Isle of Thanet Electric Tramways Co. invite tenders for general stores for the year commencing October 1st. Particulars from the Manager, St. Peters, Kent.

Metropolitan Railway Co.—Tenders are invited for stores for the year commencing November 1st, including electric wires and cables, electric lamps, carbons, switches, fuses, telephones, batteries, and insulating materials. Particulars from the Secretary, 32 Westbourne Park, London, W., and tenders by October 3rd.

Wigan.—An application is to be made to the Local Government Board for a loan of £6,900 as follows: Extensions to present loops and construction of additional loops, £2,700; six new single-truck double-deck cars, £4,200.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

New Sunday schools for Seven Kings and Goodmayes.

P.O. buildings at Chislehurst. H.M. Office of Works.

New branch libraries at Hackney.

Three public libraries at Deptford.

Cinematograph theatre in Romford Road. The Manor Park Cinematograph Theatres, Ltd.

Tenders are invited by the London County Council for electrical installations at the Coroner's Court, Poplar, E., and Hoxton House Schools, Shoreditch, N. (See an advertisement.)

PROVINCES.

Aberdeen.—Craibstone House, New Hills.

Aberdeen & North of Scotland College of Agriculture.

Abertillery.—Thirty-one houses at Cwmtillery. Borough Engineer.

Aldershot.—Additions to Aldershot Steam Laundry.

Altrincham.—Extensions to hospital (£8,000). Board of Management.

Andover.—Post office. H.M. Office of Works, London.

Atherton.—Chapel in Back Lane.

Ayr.—School in Green Street Lane.

Barrow-in-Furness.—New Corporation Fire Station.

Belfast.—Addition to Royal Hospital.

Bishop Auckland.—Workhouse.

Blackburn.—Higher Elementary School (£24,150), and new Sessions House and Police Court (£15,000), at Blakey Moor.

Blackpool.—Public Swimming Baths.

Blaydon.—Electric theatre. Local company being formed.

Blythe.—Town Hall and Municipal Offices.

Bognor.—School in London Road. Rev. A. Gilling.

Bradford.—Wesleyan Methodist Sunday Schools at Oakenshaw.

Digitized by Google

Braintree.—Drill hall. Essex Territorial Association.
Canterbury.—The Canterbury Guardians have decided by ten votes to three to light the Workhouse and Infirmary by electricity. Borough Electrical Engineer.
Clitheroe.—Secondary School (£19,300).
Crewe.—Cinematograph theatre.
Darlington.—Aged Miners' Home. Architects, Messrs. Kitching & Lee, Houndgate Chambers.
Douglas (I. of M.).—Ball room in new public garden. Town Clerk.
Droylsden.—Extensions to Messrs. W. M. Christy's mills.
Dunfermline.—Extensions to St. Margaret's Linen Works.
Edinburgh.—Alterations to organ factory, Saughtonhall Drive. Architect, J. M. Maclean, 33 Dundas Street.
Epsom.—New Fire Station.
Farnworth.—School for St. Thomas' Church. Rev. C. F. Ockford.
Glasgow.—Hall. Scottish History Exhibition.
Church in Southern suburbs. Congregational Union.
New Fire Station.
Halesowen.—Alterations to Council Schools. Managers.
Hayes.—Works for Goss Manufacturing Co.
Hebden Bridge.—Thirteen houses in Braceswell Street. J. Downs.
Street of houses in East View. E. Harrison.
Helensburgh.—Post Office. H.M. Office of Works, 3 Parliament Square, Edinburgh.
Hindley.—Electric theatre in Market Street.
Kidderminster.—Beet sugar factory. The Mayor.
King's Lynn.—Extensions to West Norfolk and Lynn Hospital.
Larne.—Technical School in Victoria Street.
Leith.—Town Hall and Library.
Lincoln.—Twenty-six houses in Peel Street. F. Clark.
Twenty-nine in Burton Road. J. M. Harrison.
Malvern.—New Parish Hall.
Mansfield.—Schools in Carter Lane.
Middlesborough.—Sunday School at Linthorpe Road. Primitive Methodist Church in conjunction with business premises.
Newton Abbott.—Infirmary. Architect, Mr. S. Seagar.
Norwich.—Alterations and additions to Halvergate Non-provided School. Architects, Messrs. Lacey & Upcher, 6 Upper King Street.
Padiham.—School at Hopton. Education Committee.
Penge.—Additions to offices at Town Hall. Town Clerk.
Perth.—New school (£20,000).
Portsmouth.—150 new houses.
Ramsgate.—Picture theatre in King Street.
St. Ann's-on-Sea.—Primitive Methodist School.
Sudbury.—Isolation Hospital. Architects, Abdey Haserodt & Co.
Swansea.—Extensions to central police station.
Tipperary.—Workhouse. Board of Guardians.
Torquay.—New Town Hall.
Twickenham.—Cinematograph theatre. Mr. W. C. Phillips.
Weston-super-Mare.—Pavilion in Clarence Park. Town Clerk.
Weymouth.—Pier pavilion. Architects, Messrs. Manquall & Littlewoods, Manchester.
Wolverhampton.—High School for Girls in Tettenhall Road. Enlargement of Sunbeam Motor-car Works.
Drill Hall, Riding School, and Headquarter Offices, County Territorial Force Association.

Wireless Telegraph Notes.—According to the *Cape Times*, the South African Government have decided upon a tender for a wireless telegraph station on the Cape coast, but the exact spot where the station will be erected will not be decided upon until the expert sent out from England has made investigations and reported.

The *Financial News* states that the Marconi Co. have obtained an order for fitting eleven Turkish battleships with wireless telegraph apparatus, and the erection of a coast station, probably at Stefano.

Interruption on the Mersey Railway.—On Wednesday evening of last week a stoppage of supply and extinction of the lights occurred at the Central Station, Liverpool, of the Mersey Railway, just as the passengers had alighted from a train. The interruption appears to have been due to a short-circuit on a jumper cable connecting a track feeder to the track. Some inconvenience was caused by the darkness, and the smell of burning insulation, but the trouble was quickly remedied, and traffic was soon resumed as far as James-street, and later on to the central station. It would appear that the exit lights were run on the same circuit as the track, which is not the case in the London electric railways.

TENDERS RECEIVED AND ACCEPTED

Bacup.—A contract has been entered into with the D.P. Battery Co. for the maintenance of the electricity works' battery for a period of ten years. The tender of Messrs. Crompton & Co. has been accepted for the supply of a negative booster, and that of Messrs. Whipp & Bourne for additional switchboard panels.
Belfast.—Messrs. Coates & Son, Belfast, have got the contract for the lighting of the Whiteabbey Sanatorium with electricity. A gas plant is to be installed.
Blackburn.—The Council have accepted the tender of Messrs. Burrows & Garland, for the supply of wrought iron tubes to the Electricity Department.
Bristol.—The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., for the supply of three-phase extra high-tension and low-tension direct-current switchgear at the Dock sub-station, Underfall Yard, has been extended at £204 15s., and that of the British Westinghouse Co. for two three-phase 3,000-kw. turbo-alternators at £25,290. A contract for the supply of arc lamp globes for 12 months has been placed with the City Glass Co. at £38 15s.
Kirkcaldy.—The tender of Mr. W. Dobson, of Edinburgh, at £6,664, is recommended for acceptance for the extension of the tramways at Dysart, consisting of a mile of single track with four passing places.
Radcliffe.—The tender of Mr. W. Brierly has been accepted for the electric lighting of the new Council Offices.
South Africa.—The Durban Council have accepted the tender of Messrs. C. A. Parsons & Co. for the supply of two 2,000-kw. turbo-alternators at £12,920.

The Maschinenfabrik Augsburg-Nürnberg A.-G. (M.A.N.) (London office, Caxton House, Westminster) have recently received an order from Messrs. Mitsui & Co., the well-known Japanese mine-owners, for two gas engines of 3,200-h.p. each for running off coke oven gas and driving electrical generating plant. The Lilleshall Co., of Shropshire, who are the licensees under the M.A.N. Co. for the manufacture of the Nuremberg engine in this country have also recently secured orders from the United Alkali Co., Widnes, and Messrs. Allwright & Wilson, of Oldbury, for large gas-engine plants.

Extensions of Power Supply at Newcastle.—Another new sub-station installation has recently been put into commission for supplying the growing demand for power at the works of Messrs. C. A. Parsons & Co., Henry Watson & Sons, and Messrs. Donkin, at Heaton. The building is of a size for accommodating some 1,500 h.p. of transforming plant, there being at present in it two 700-h.p. transformers, both supplied by the Electrical Co., of London. The object of the addition is to give a duplicate supply, and also to meet the increased load, and the transformers are cooled by oil. The switchgear for the high-pressure side, which works at 5,500 volts, is of the Brown-Boveri type, there being two combined feeder and transformer panels. The switchgear for controlling the low-pressure current, 440 volts, which is used in the works, was made by Reyrolle & Co., of Hebburn.

Speed Indicators for Tramcars.—According to the official circular of the Tramways and Light Railways Association, the committee on speed indicators of the Association has reported that out of a total of twenty-four firms who replied to the committee's invitation to submit instruments for trial purposes, fifteen had accepted the conditions laid down by the committee, and their respective indicators were now being tried on various tramway systems. The report of the committee will be prepared in November.

University College.—The session in the faculty of engineering at University College begins on October 3rd. The Provost and the Dean will attend on Monday and Tuesday, October 3rd and 4th, from 10 a.m. to 1 p.m., for the purpose of interviewing students and advising them as to their courses. In addition to the regular undergraduate courses, the following post-graduate courses will be given during the coming term:—Steam Turbines (supplementary to course in session 1909–10), by Mr. E. G. Izod, of Messrs. Willans & Robinson, on Fridays, at 5.30, beginning October 21st; Railway Engineering, by H. Deans, M.Inst.C.E., of the Great Western Railway, on Mondays and Thursdays at 5, beginning October 6th; Photographic Surveying, by M. T. Ormsby, on Fridays at 4, beginning October 14th; Electrical Design, by H. M. Hobart, M.Inst.C.E., on Mondays from 5 to 7, beginning October 10th.

Core-Plate Varnish, &c., &c.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £57 15s. to £58 per ton (last week, £58 to £58 10s.).

Agency.—Messrs. Pooley & Austin, 25 Victoria Street, London, have been appointed sole London agents for Messrs. I. Frankenburg & Sons, of Salford.

Holophane Reflectors.—Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), inform us that they will shortly be placing on the market a series of eighteen new prismatic reflectors of the holophane type, specially suitable for "Tantalum" lamps.

Bankruptcies.—The last day for receiving proofs in the bankruptcy of Harold Bristow, electrician, 368 Hessel Road, Hull, is September 26th. The trustee is Mr. G. H. Atcheson, York City Bank Chambers, Lowgate, Hull.

The last day for receiving proofs in the bankruptcy of J. G. Cunnington and H. P. Allison is September 30th. The trustee is Mr. Alfred Page, 28 King Street, Cheapside, London.

A first and final dividend of 4s. in the £ will be paid on September 23rd at 1 Clothhall Street, Huddersfield, in the bankruptcy of Harry Graham, Electrician, Albion Street, Huddersfield.

APPOINTMENTS AND PERSONAL NOTES

Messrs. Snell & Moore Ede, Consulting Engineers (Caxton House, Westminster) are amalgamating with Messrs. Preece & Cardew as from October 1st. The firm will be known as Preece, Cardew & Snell, and the offices will remain at Messrs. Preece & Cardew's address, 8 Queen Anne's Gate, S.W., to which address all communications should be sent after September 30th. Mr. J. H. Woodward, who has been upon Messrs. Preece & Cardew's staff for the past twelve years, will also become a partner. The partners will thus be:—Sir W. H. Preece, Mr. A. H. Preece, Mr. J. F. C. Snell, Mr. Llewellyn Preece, Mr. J. H. Woodward, and Mr. S. S. Moore Ede.

Mr. W. H. Chatten, electrical fitter apprentice at Sheerness Dockyard, who was recently awarded the first Admiralty scholarship in electrical engineering, has now been awarded the Kent County Scholarship for Science valued at £60 per annum for two years.

Sir Clifton Robinson was entertained to dinner on Friday evening by the Metropolitan Association of Electric Tramway Managers in celebration of the jubilee of the introduction of tramways in England.

We regret to learn of an accident to Mr. W. T. Le Feuvre, Borough Electrical Engineer at Bexhill. Whilst undergoing his annual training with the Royal Engineers at Chatham on Friday, Mr. Le Feuvre slipped to the ground from a distance of 15 feet and broke his ankle.

A draughtsman is required in the York Electricity Department. Salary, two guineas per week. Applications to the City Electrical Engineer by September 24th.

Mr. W. Vincent Waite, late Works Manager to Messrs. Bruce Peebles & Co., Ltd., was entertained at a complimentary dinner in Edinburgh on the 14th inst., on the occasion of his leaving the firm to start business on his own account in Cardiff. Earlier in the day Mr. Waite was presented with a handsome sideboard, and Mrs. Waite with a silver salver by the workmen and staff. The presentation was made by Mr. Lee Murray, General Manager. Mr. W. A. Scott, formerly Assistant Works Manager, has been appointed to fill the vacancy created by Mr. Waite leaving the firm.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

United Electric Car Co.—A dividend of 2½ per cent., less tax, is recommended for the year on the ordinary shares.

British Thomson-Houston Co.—The balance-sheet for the year to March 31st, 1910, shows a profit of £10,932, after meeting debenture and loan interest. The sum of £5,000 is written off for depreciation on Rugby factory; £2,825 for depreciation on apparatus, meters, supplies, &c.; £1,045 for depreciation on goodwill, patents, and licences; and £500 for depreciation on office furniture, &c. A balance of £248 is carried forward. The company have exchanged licences with the owners of the Osram lamp patents on all its patents. An addition has been made to the incandescent lamp factory, costing £19,000, practically doubling its size, and an extension to the main factory, largely in connection with the turbine business, at a cost of £30,000, is nearing completion, whilst a further building is being enlarged at a cost of £11,000.

Melbourne Tramways & Omnibus Co.—Dividend of 4½d. per share for the quarter to September 30th.

Allgemeine Electricitäts Gesellschaft.—A balance of 18,425,000 marks is shown by the accounts for the June half-year, after meeting debenture interest and depreciation. A dividend of 14 per cent. is recommended, compared with 13 per cent. in the previous year. In addition to the usual sums written off, 1,000,000 marks are added to general reserve, and a further 1,000,000 marks to special reserve. The proposals with regard to the Felten Guilleaume-Lahmeyer Works (ELECTRICAL ENGINEERING, September 8th, p. 572) will be laid before the shareholders on October 15th.

Dick, Kerr & Co.—The report to be submitted to the meeting next week gives the profits for the year ended June 30th at £22,820, leaving a balance of £10,416, after payment of debenture interest, &c. £63,141 was brought forward from last year, and it is proposed to pay a dividend of 5 per cent. and to carry forward £42,258.

The Municipal Wiring Bill.—In our issue of September 8th we published a full list of the towns which had come to a decision with regard to the proposed Municipal Wiring Bill, giving their attitude in the matter in each case. A short supplementary list was published on p. 598 of our last issue. The following additional decisions have now been come to:—Ayr, Wakefield, and Manchester have promised financial support. Northampton, Chester, Shrewsbury, Radcliffe, Burnley, and Leytonstone have promised "moral" but not financial support. Sunderland has expressed itself in favour of the Bill. St. Anne's-on-Sea will take no action, and Bexley Heath will consider the matter again.

SUMMARY

Another correspondent criticises the rule of the Association of Consulting Engineers to admit only corporate members of the Institution of Civil Engineers. He questions the need for the new Association. (Page 616.)

We publish an illustrated description of the cable works at Derby, where Rickard's, Macintosh's, and Simplex cables are manufactured. (Page 617.)

A short article gives particulars of the new series of posters, showcards, and other advertising matter relating to tantalum lamps, which Siemens Bros. Dynamo Works are placing at the disposal of contractors and agents, and also refers briefly to the testing and dispatching department at the firm's lamp works in Dalston. (Page 619.)

Permanent showrooms with model rooms in which continuous demonstrations of electric cooking and ironing are given, have been opened by the Hackney Borough Electricity Supply Department. (Page 620.)

A short description is given of the Trotter accelerometer, which is a simple instrument depending on the spirit level principle. (Page 620.)

At the annual Conference of the Municipal Tramways Association in Bradford last week, Mr. A. Baker, of Birmingham, recommended reserving a portion of the roadway for tramways, keeping the ordinary traffic off the track. If this were done, he estimates that there could be a saving of £3,500 per mile of double track in cost of paving, in addition to a large saving in maintenance. The question of the durability of brake shoes and tyres was also dealt with, but opinions differed as to the possibility of standardisation in this respect, owing to the varying conditions of different tramway systems. A report upon motor bearings recommended ring lubrication, and quoted some interesting but very divergent figures as to the life of bearings. Tramway authorities were urged by Mr. C. J. Spencer (Bradford), the President, to develop the carriage of goods and parcels on tramways. The "trackless trolley" system was also discussed. Mr. J. Dalrymple, general manager of the Glasgow Corporation Tramways, was elected President. (Page 621.)

A Board of Trade report has been issued on certain boiler tube troubles at Whitehaven electricity works, which were due to corrosion caused by unsuitable feed-water used during a stoppage of the town water supply. (Page 622.)

Mr. P. Cooper-Hewitt claims to have produced a fluorescent reflector which is capable of absorbing high-frequency rays and radiating a sufficient amount of red rays to supply those wanting in the light of the mercury vapour lamp, and thus producing a light approximating to daylight. (Page 622.)

Three new designs of single-phase locomotives, two for the Lötchberg tunnel railway in Switzerland and one for an Austrian railway, are described. Each is

Digitized by Google

equipped with two large motors raised well above the frame, and driving through coupling rods. In two of the locomotives, gearing is interposed between the motor and the coupled driving wheels. (Page 623.)

A NEW design of petrol-electric railway car is being put into service on the Prussian State Railways. It has two two-axle bogies; one carries a 100-h.p. 6-cylinder V-type petrol engine coupled to a 60-kw. dynamo. The dynamo is controlled on the Ward-Leonard principle, and supplies two 82-h.p. interpole motors mounted on the other bogie. The total weight of the car, carrying 100 passengers, is 47 tons, and a speed of 30 miles per hour is attained. (Page 623.)

AMONG the specifications published by the Patent Office on Thursday last were two by the Badische Anilin and Soda Fabrik, covering improvements in their arc furnace for the fixation of atmospheric nitrogen.—A directive aerial for wireless telegraphy, comprising a low horizontal antenna in the plane of the two stations is described by G. Marconi.—Opposition has been entered to a patent by Pope's Electric Lamp Co., for a cement for joining metal filaments to leading-in wires, and consisting of a mixture of tungsten powder, ammonia, and silicic acid. (Page 624.)

THE work of the Physikalisch-Technische Reichsanstalt during 1909 included important work on resistance and E.M.F. standards, and some interesting tests on meters. A new mercury resistance thermometer proved very successful. Experiments are being conducted with a view to the production of an iron free from hysteresis. (Page 625.)

A CONSULTING engineer is to be called in at Coventry regarding the purchase of the tramways.—The proposal of the Edinburgh Electricity Committee to use the electricity profits for reducing capital has not been approved.—An effort to restrict Mr. Vignoles, the Borough Electrical Engineer at Grimsby, in regard to advertising, has been defeated.—The capital for the electric power scheme in Bombay is being subscribed locally.—Keighley Corporation are to apply for powers to adopt trolley omnibuses.—The Leicester Electricity Committee formally recommend the Corporation not to appeal against Mr. Justice Neville's decision *re* wiring.—A report upon the new Thames Bridge to carry tramways is to be prepared.—The Scarborough Tramways Co. are suspending their service during the winter. (Page 626.)

EXTENSIONS are to be carried out at Dartford (£10,000); Norwich (£18,790); Walsall (£23,225); and also at Oldham. Generating sets are required by the Secretary of State for India. A number of electric lighting schemes are under consideration in South Africa; arc lamp carbons are required at Hackney; and electrical stores by the York Corporation and Mersey Railway Co. (Page 627.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY), THURSDAY, SEPTEMBER 29TH.

Iron and Steel Institute.

9 a.m.—Meeting in Old Theatre, Pavilion Gardens, Buxton.
(1) "On Electric Steel Refining," by D. F. Campbell.
(2) "On the Utilisation of Electric Power in the Iron and Steel Industry," by J. E. Schuurman.

MONDAY, OCTOBER 3RD.

Society of Engineers.

7.30 p.m.—At Caxton Hall, Westminster. "Current Professional Topics," by H. C. Adams.

The Association of Mining Electrical Engineers.—A meeting of the Warwickshire and South Staffordshire Branch of the Association was held last Saturday at the Imperial Hotel, Birmingham, when Mr. W. Maurice, President of the Association, addressed the meeting on the working of the Association generally. The discussion on Mr. W. Foster's Paper on the resistance of the human body to electric currents was held over till the next meeting.

CORRESPONDENCE

THE ASSOCIATION OF CONSULTING ENGINEERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—So far as I can see, the Association of Consulting Engineers will defeat its own object by insisting that membership of the Institute of Civil Engineers is compulsory before election to the Association, and will exclude a considerable number of the best men. The Association will, therefore, not be representative, and thereby the benefit to its members will be reduced. I cannot quite understand why consulting electrical engineers should bother about the Association; it can, with such restrictions, be only a small body, and where one is evidently not wanted as a member, why trouble about it? The Institution of Electrical Engineers is now so well-known and recognised that I fail to see the use of the new Association.

Hampton Wick, September 24th, 1910.

Yours, &c.,
A. C. COCKBURN.

ANSWERS TO CORRESPONDENTS

Correspondents must in all cases send their names and addresses with their queries, and, if they do not desire the reply to be published after their own name, should add a "nom de plume." Questions should be addressed to The Editor, ELECTRICAL ENGINEERING, *203-6 Temple Chambers, Temple Avenue, London, E.C. The Editor will not guarantee to answer all questions in this column, and the enclosure of a stamped and addressed envelope is therefore desirable. Books recommended will be forwarded on receipt of a remittance for the amount mentioned.*

S.E. Co.—200 and 100 volts alternating 50 cycles, and 500 and 240 volts continuous; 230 volts continuous; 220 and 440 volts continuous.

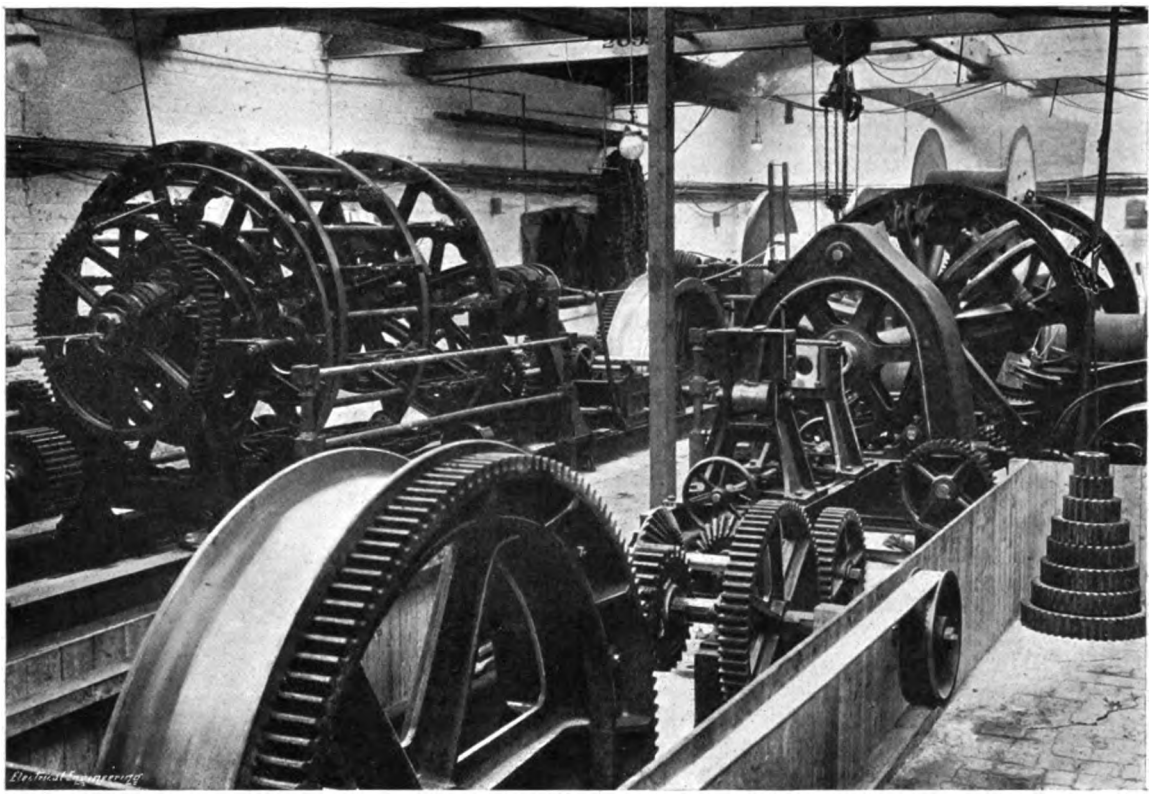
WAITING.—If you are within 60 ft. of a distributing main the company must supply you if you request them to. If the distance exceeds 60 ft. but is less than 50 yards, you can also demand a supply on agreeing to defray the cost of the service main, and contracting to take a supply for two years.

CONSULTANT.—The contractor's delay is unpardonable, but the legal position with regard to the enforcement of the penalty clause is difficult. On the other hand, the contractor may be made to realise that his delinquencies will not be forgotten when you have other work to place.

NEWPORT asks, is it allowable to deduct subscriptions to the Institution of Civil Engineers, and other professional bodies, from income tax returns, as part of expenses of one's profession?—We see no reason why this should not be in order, and advise you to try it. We shall be pleased to hear the result.

Telegraph Traffic.—In the report of the Royal Commission on Trade Relations between Canada and the West Indies, the high rates for telegraph messages to and between the West Indies are commented upon, and the public ownership and operation of the cables in the British West Indies, and possibly of the whole system northward to Halifax, is suggested as advantageous. The Commissioners express the hope that this might be arranged by the Imperial Government in conference with the Canadian Government. It is estimated that the three cable companies could be bought out for £525,000, and that a new cable and the partial installation of wireless telegraphy would cost £475,000.

A French telegraph office will be opened at El Aŭourn Sidi Mellouck, in Morocco, on October 1st next.—The Bagdad-Bassorah line was repaired on the 21st inst., and on the following day communication between Tangier and Mogador was restored.—On the 24th the Rome-Constantinople line failed, and communication between Oran and Tangier was stopped.—On the 25th inst. the cable between Tourane and Amoy ceased working.—On the 22nd inst. the Compagnie Française des Cables Télégraphiques managed to repair their section between New York and Haiti, which had been down since July 29th last.



The C.S. *Mackay-Bennett*, of the Commercial Cable Co., has been occupied in repairing, not only the cable of the Direct United States Cable Co., but also of the Commercial Cable Co. of Cuba.—The *Minia*, of the Anglo-American Telegraph Co., has been at work on the cables of the Western Union Telegraph Co., and on the Sydney-Placentia cable. She also had to do work in connection with the North Sydney and St. Pierre cable.—The French cable steamer *Contre Amiral Coubet*, after a long rest in port, was called upon to repair the break in the New York-Haiti cable, which was done successfully, the break being about 350 nautical miles from New York.—The *Robert C. Clowry*, of the Western Union Telegraph Co., was engaged on the Canso-New York sections of the Company, and afterwards returned to New York.

The Western Union Telegraph Co. have applied to the Board of Trade for a licence to land two additional cables from America at Sennen Cove, Cornwall.

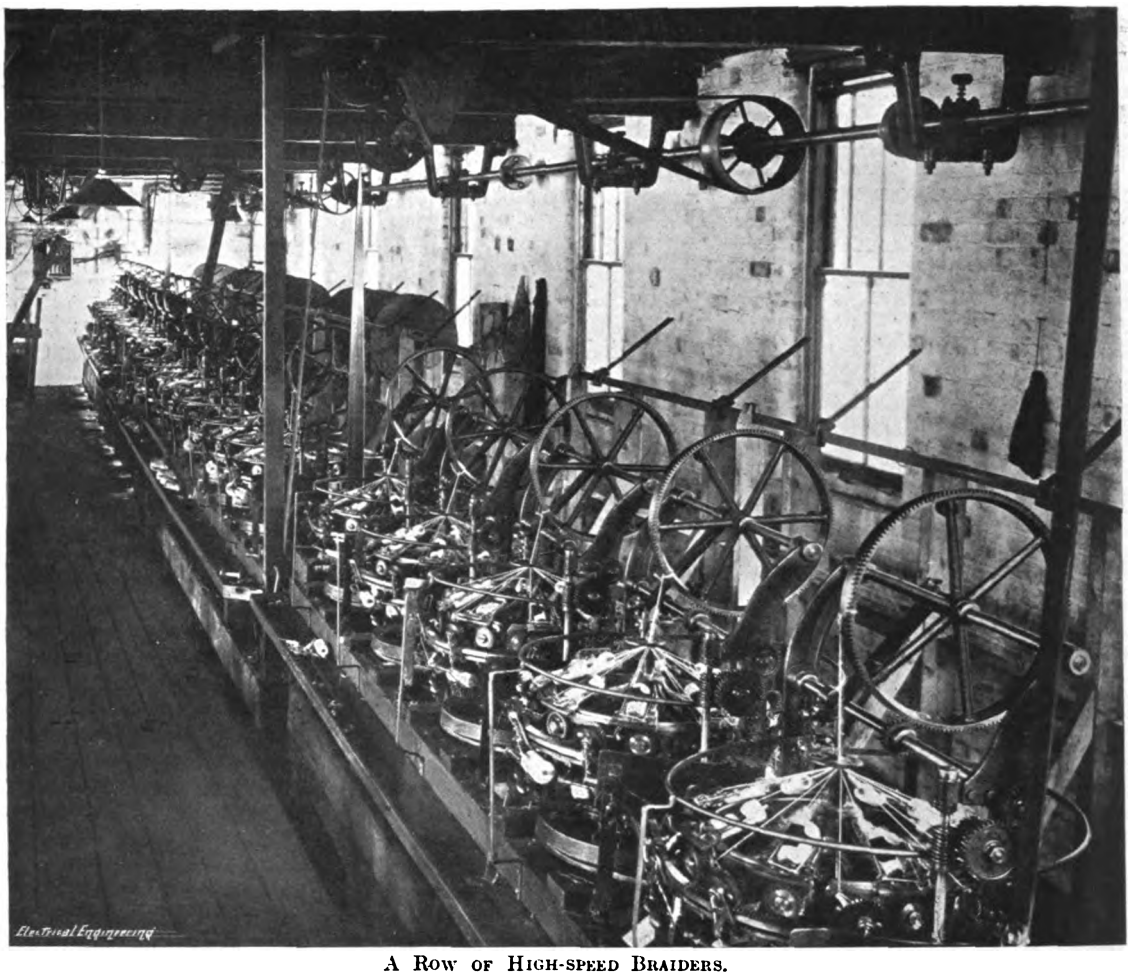
RICKARD'S CABLE WORKS

WE had an opportunity last week of visiting the cable works at Derby, where the cable supplied by Messrs. W. Rickard, Ltd., Chas. Macintosh and Co., and Simplex Conduits, Ltd., is manufactured. At these works, which have recently been extended, originally only house-wiring cable, flexible, bell-wire, and other light insulated wire was produced, but they are now equipped for the manufacture of the heaviest vulcanised rubber cable, and also bitumen cable, and a lead press has been put in for lead-covered rubber cable for which there is a growing demand. The actual rubber mixing is not carried out at these works, as the vulcanising rubber is supplied in sheets from Messrs. Chas. Macintosh's works at Manchester (the old-established rubber manufacturers who were the originators of the "macintosh" and the vulcanised rubber process).

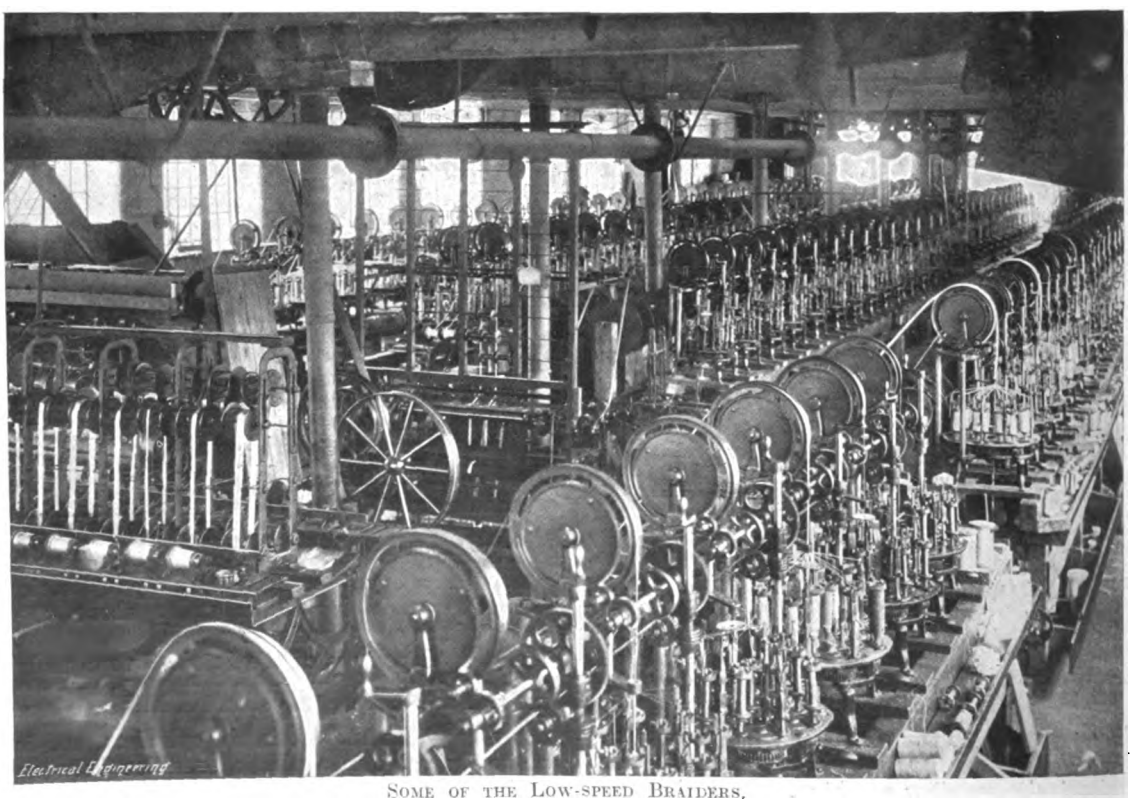
LARGE LAYING-UP MACHINE AND PART OF ONE OF THE LARGE STRANDING MACHINES.

The works are arranged in shops corresponding rather to the various classes of wire than to the operations carried on, so as to avoid as much as possible the transference of the cable from one shop to another during manufacture. Thus, for instance, instead of there being one stranding shop for all classes of cable and wire, practically every department has its own stranding machines. In the shop for small V.R. cable the compound rubber sheets are cut into bobbins of the required width in a simple cutting lathe. A number of wooden discs are threaded on a mandrel, the rubber sheet is wound on it, and then the mandrel is rotated in the lathe, and the rubber is cut through in widths corresponding to the discs. The copper wire has previously been stranded and covered with a lap of pure Para rubber, and the compound rubber strip is put on in a "longitudinal" covering machine. Over the pure rubber a layer of separator rubber is placed, then a "vulcanising jacket," and then the compound rubber is put on in layers to the desired radial thickness. The intermediate "separator" and "vulcanising jacket" are to ensure a perfect vulcanisation of the pure rubber to the compound rubber in the subsequent vulcanising process. In the longitudinal covering machine, the wire and rubber strip pass between grooved steel cylinders, which fold the rubber round the wire and trim it off. The rubber adheres together where it is cut, and the longitudinal seam subsequently disappears in vulcanisation. When comparatively small wire or cable is covered, several wires can pass simultaneously through the machine. At Messrs. Rickard's works there are machines taking 12 to 24 wires, and by replacing the steel cylinders with others having larger and fewer grooves, cables up to 61/12 can be covered in the same machine.



There is no novelty in this method of rubber covering, which is the one customarily employed in this country, but we have described it in some detail, as it may not be known to all our readers, who, as users of cable, will doubtless be interested in the method of manufacture. The rubber-covered cable is next lapped with a waterproof tape in a taping machine, and is then vulcanised. One of the taping machines is a 4-spindle vertical machine, which can tape 300 miles of cable in a week. The vulcaniser consists of perforated circular trays and cylinders, upon which the cable is coiled; these are placed one over another in a deep cylindrical drum, through which dry steam under about 40 lbs. per square inch pressure is passed.

The lead press is of the Friedr. Krupp make, with a pair of horizontal hydraulic rams. In this pattern the melting-pot for the lead is on the press. The lead cools down to about 120° C. in the cylinders, and is pressed on to the cable in a plastic condition between a point and die.



So far as the machines are concerned, bitumen covering is simpler than rubber covering. The bitumen is fed, in the form of small rough blocks, on to a pair of heated calenders and worked up into sheets about $\frac{3}{8}$ in.

Digitized by Google

thick. The conductor to be covered is first wrapped with a special "friction" tape, a tape impregnated by friction instead of between rollers. The bitumen sheet is cut up into short strips about 18 in. long, and is fed into a forcing machine through which the conductor passes. This machine consists of a worm revolving in a cylindrical vessel—on the same principle as a sausage machine—and the bitumen is forced round the wire. There are two of these machines, and quite small wire up to cable 4 in. in diameter can be dealt with.

A ROW OF HIGH-SPEED BRAIDERS.

SOME OF THE LOW-SPEED BRAIDERS.

Digitized by Google

A large laying-up machine is seen in one of our illustrations; this is employed chiefly for 3-core bitumen cable, and has been used with cable up to 61/12. It is driven by a 25 h.p. motor. On the same picture is seen part of one of the two large stranding and armouring machines, which can lay-up a 169-strand cable in one operation if necessary. All these heavier machines and a fair proportion of the smaller ones are driven by A.C. motors, but they are being replaced shortly by D.C. motors. Power is taken from the Derby Corporation mains, and about 200 h.p. is employed. The remaining machines, which are steam-driven, will ultimately be motor-driven also, as soon as the output of the works is sufficiently large for all the steam from the boilers to be required for the vulcanisers etc.

Two types of braiding machines are employed. In one of the shops there are 70 high-speed braiders (see illustration), made by Vickers, Sons and Maxim, and each capable of braiding three miles of cable per week. These are employed for the braiding of V.R. cables, and also for flexibles with ordinary cotton braiding. For silk and glacé cotton flexibles, however, slow-speed machines have to be employed, and there are about 600 of these in the works. The third illustration is a view of some of the braiders in one of the "flexible" shops. In these shops the stranding, rubber-covering, and cotton-lapping is also carried out, and among the machines are a pair of most ingenious combined laying-up and cotton-covering machines for fine flex, in which there is a simple but effective device for indicating when a wire breaks. One girl can look after 6 heads of this machine, and in the case of the slow-speed braiders one girl can attend nine or ten machines. Besides the combined laying-up and cotton-covering machines are a number of stranding and cotton-lapping machines, both of the vertical type. The machine seen to the left in the illustration is one of several for winding off the skeins of cotton and silk into bobbins for use in the lapping and braiding machines.

Before leaving the works we visited the test room, where we were shown a sample of 7/14 V.B. cable, insulated to 100 mils radial thickness, which had stood the test of being bent 12 times in reverse directions round a 6 in. drum without the insulation being impaired. Another sample had been subjected to steam heating at 280° F. for two hours without showing signs of decentralisation. There are six testing tables, three for insulation and capacity tests with the usual Rymer Jones Keys, two for bridge tests with the bridge sunk so that the top of the box is on a level with the table, and one table provided with a circular bridge wire for low resistance measurements. Moving coil galvanometers are used, placed on brick pillars and with transparent scales, so that the room can always be well lighted. There are arrangements for high pressure testing, and a transformer for extra high pressure tests is being added.

Our thanks are due to Mr. T. Martin Harvey for showing us over the works, and also for having the three photographs taken specially for the purpose of illustrating this article.

The Borough Polytechnic.—We have received a copy of the prospectus of this Institution for the session which commenced last Monday. The electric wiring courses have been re-arranged, and there are certain new classes in mechanical engineering, besides extension and development of the work in other departments.

Electric Power in Shipbuilding.—Considerable extensions have been made in the electrical equipment of the Wallsend shipyard of Messrs. Swan, Hunter & Wigham Richardson. Power is supplied from the Carville station of the Newcastle-upon-Tyne Electric Supply Co., through a special sub-station, of 2,000 to 3,000 h.p. capacity, equipped with four transformers supplied by the Electrical Co., and is distributed at 440 volts. The high-tension side is controlled from the power house, which almost adjoins the works, so that there is no high-tension switchgear in the sub-station. The low-tension side is equipped with Reyrolle ironclad switchgear.

"TANTALUM" POSTERS AND ADVERTISEMENT LITERATURE

WE have been asked by Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), to invite wiring contractors and sellers of electric lighting material to apply to them for the new series of posters, showcards, and other advertising literature which the firm have now prepared for the lighting season. Messrs. Siemens' policy is to assist the trade as much as possible in the sale of tantalum lamps, and the pictorial matter which has been prepared should certainly be of value to those who act as retail intermediaries between the works and the general public.

First and foremost we may mention the latest edition of the "Satisfied consumer" series of posters, &c. The satisfied consumer, with his beaming countenance, remains as before, but in place of the words "My electric light bill halved," the picture bears the motto, "Lighter than ever." Posters measuring 80 ins. by 60 ins., and also 120 ins. by 80 ins., will be supplied to any person who has a suitable space for displaying them about his premises, and of more service to the majority of retail firms will be the showcard measuring 12 ins. by 9 ins., in which the design is printed in five colours with the main features embossed, the lettering being glazed to make it stand out very prominently.

The firm are also supplying a five-coloured card giving reduced *facsimiles* of all types of literature, which they overprint in quantities with the contractor's name and address, free of charge. This includes picture postcards, and three or four types of adhesive labels, supplied for attaching to correspondence. The postcards are printed with the same design, and on the back the contractor's name and address can be overprinted so that they may be used as correspondence cards. The adhesive

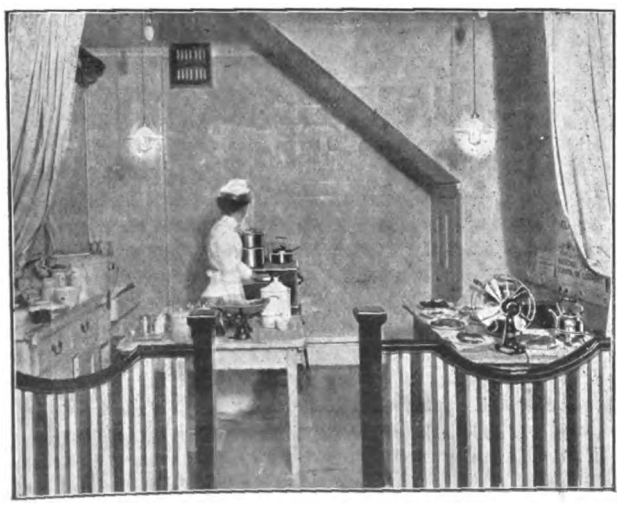
labels, with the Hassall "Brilliant passage" picture and the photograph of the Dalston works, are well known and widely used, and the latest production of the firm in this respect is a cut-out in the shape of a "Tantalum" lamp, which has been lithographed in colours and on which the words "Use 'Tantalum' lamps" appear.

Sellers of tantalum lamps are also being assisted considerably by the large posters of the new edition of the "Satisfied Consumer," which are appearing on hoardings in all the large provincial towns, and in the metropolis and suburbs, tube railways, and railway stations.

On the occasion of a recent visit to Messrs. Siemens' Dalston lamp works, we were privileged to inspect the testing and packing departments, which is as far in the direction of the lamp factory as the visitor is permitted to penetrate. In both departments the one impression imparted is a realisation of the great mechanical strength of the lamps and their filaments. Lamps for despatch by road or rail are packed in casks simply wrapped in the usual corrugated card and paper, with such packing as would be employed for any other glass goods, and in the testing department a glance at the methods of handling the lamps is sufficient to dispel any anxiety as to their fragility. The tests to which we refer are not the accurate ones which are carried out during manufacture and previous to capping in the manufacturing portion of the works, from which strangers are excluded, but the last tests of a rougher nature, made before the lamps are finally allowed to leave the works. These are performed both on the lamps manufactured at Dalston and on those which have still to be imported from the German works to make up the enormous demand that has to be met.

Digitized by Google

The first test is for vacuum. The lamps are placed cap downwards in a tray connected to earth and filled with iron filings, and a sort of cap of insulating material, containing a metal contact plate charged at 10,000 volts through a heavily insulated flexible cable, is placed over each lamp in succession. If a glow is set up in the bulb of the lamp, the vacuum is imperfect, and the lamp is rejected. The lamps are next placed in holders on racks, where they are run at their rated pressure, and if any glow too brightly or are dull this is seen at once and the lamp is taken out either for rejection or for placing among the other lamps of its own voltage and candle-power. After these weeded-out lamps have been removed from the testing rack, the indication of the wrong voltage and candle-power on the caps is removed on a small polishing machine. The lamps which are correctly rated are stamped with a stamp bearing letters representing the date before being taken off the racks and sent down to the stores. In the same department of the works is a testing room for the use of inspectors and engineers taking reception tests; it is fitted with a photometer with a Simmance-Abady flicker head, a self-contained Siemens voltmeter with three ranges, a similar ammeter, and the necessary switches and regulating resistances.



MUNICIPAL SHOWROOMS AT HACKNEY

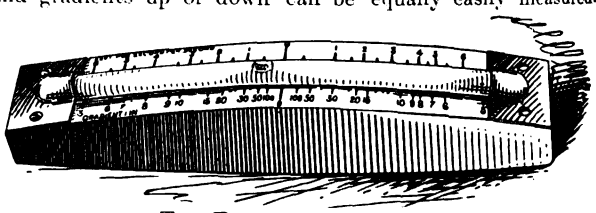
NEW show-rooms, comprising a permanent exhibition of electrical domestic appliances, lighting fittings, and power accessories, have just been opened at the offices of the Metropolitan Borough of Hackney, Electricity Supply Department,

A CORNER OF THE GENERAL SHOWROOM.

306 Mare Street, Hackney. The ground floor is divided into four portions, fitted up as a general show-room, model sitting-room, kitchen, and reception-room respectively, and special demonstrations will be arranged from time to time in the display windows. At present one window is occupied by a local

THE MODEL KITCHEN.

laundry, who are demonstrating the advantages of electric ironing, while in the other window a group of girl-workers from the Siemens Dalston lamp works illustrate the testing and sorting of Tantalum and "Onewatt" tungsten lamps. The exhibits in the general room comprise a large assortment of lighting fittings, samples of the O.S. "Stannos" and other wiring systems, motors and switchgear for small power users, and domestic appliances of all kinds, most of the apparatus being connected up for demonstration.



The inquirer or the consumer who calls at the offices to settle an account is obliged to pass first through the show-room and then past the model sitting-room and kitchen before reaching the reception-room. The sitting-room is fitted up to illustrate three different methods of lighting, namely, central pendant fitting, side brackets with candle lamps, and indirect lighting with concealed ceiling lamps. In the kitchen are various patterns of heating and cooking apparatus, including the new G.E.C. oven and various grills, and appliances on the "Archer" system. A continuous demonstration of electric cooking is carried on by a certified cook, who explains the methods and advantages to lady visitors. Electric radiators are fitted in chimney-less fireplaces.

In the reception-room are desks and comfortable chairs, and tables on which are distributed pamphlets on the various uses of electricity, including an attractive booklet on the nature of the supply and the systems of charging in vogue in Hackney. The lighting of this room is most effective. Two 100-c.p. lamps are separately suspended some 18 in. from the white ceiling, and a shallow reflector of inverted-bowl shape, comprising a wire frame 2½ ft. in diameter, with a covering of red silk and a white silk lining, is hung just below each. These inverted shades are made locally to the design of the department.

Mr. L. L. Robinson, Borough Electrical Engineer, and Mr. Chas. Lill, Sales Engineer, are to be congratulated on their enterprise in arranging this exhibition. The department sells or hires out the fittings and apparatus exhibited, and will carry out complete installations either entirely themselves or through local contractors. We are indebted to Messrs. Siemens Bros. Dynamo Works for the illustrations.

THE TROTTER ACCELEROMETER

A SIMPLE and compact form of pocket accelerometer has lately been designed by Mr. A. P. Trotter, and has now been put on the market by Messrs. Everett, Edgecumbe & Co. (Collindale Works, Hendon, N.W.). The instrument is particularly well adapted for railway and tramway tests, and, as shown in the accompanying illustration of one of its forms, is on the spirit-level principle, with a curved glass tube containing a bubble, which is deflected over a scale from its zero position. The position of the bubble is affected, of course, both by the gradient and by the acceleration to which the instrument is subjected, so that the scale can be calibrated to read direct either acceleration on the level or gradient at rest or constant speed. The acceleration and gradient scales are on opposite sides of the tube, and the zero is in the centre, so that acceleration or deceleration and gradients up or down can be equally easily measured.

THE TROTTER ACCELEROMETER.

In use, the instrument has only to be placed on a window-ledge or on the floor, so that the bubble is at zero when the car is at rest, and the tube points in the direction of motion. Starting acceleration or braking retardation can then be read direct in feet per second per second, and calculations of the distance in which a car can be stopped at any speed can be made without the necessity for speed or distance measurements. Tractive resistances may be measured for cars coasting by noting the retardation. The draw-bar pull and brake horse-power during acceleration and running can then be deduced. It is important to notice that the instrument will always indicate the retardation due to frictional resistance &c. of a coasting vehicle only, whether on the level or on a gradient, as the effect of the part of the acceleration or retardation due to gravity is cancelled by the effect of the gradient on the instrument. In like manner in the case of a train starting on a hill, the acceleration due to the propelling power only is indicated, and not the actual acceleration relatively to the track. The instrument is very much simpler and less likely to become deranged than those of the pendulum pattern, and should be useful in connection with tests of electric tramcar and railway equipment and brakes, studying traffic conditions, as well as for testing motor-cars on the road. In addition to the pocket instrument illustrated, another form, fitted to a bracket for attachment to the car, is made.

MUNICIPAL TRAMWAYS CONFERENCE

A Cheaper Form of Tramway Construction v. the "Trackless Trolley." Brake Shoes and Tyres. Motor Bearings.

THE annual Conference of the Municipal Tramways Association was held in Bradford on Wednesday, Thursday, and Friday last week, under the presidency of Mr. C. J. Spencer, General Manager of the Bradford Corporation Tramways.

In his Presidential Address, Mr. Spencer first quoted a large number of figures from the Board of Trade return on tramways and light railways for the year to December, 1908, and March 31st, 1909, for companies and municipalities respectively, in order to demonstrate that municipal tramways in the mass are commercially sound. He deduced from this return that whereas company tramways have put by last year for depreciation, obsolescence, &c., an amount equal to 1·05 per cent. on a capital outlay of £23,888,485, municipal tramway undertakings in the same period put by for sinking fund, reserve, and renewals account 3½ per cent. on a capital outlay of £47,184,754. Without suggesting that municipalities in earmarking this larger sum are adequately meeting their obligations, he thought they compared with company tramways in a very satisfactory manner. The greater portion of the address was directed to the more immediate possibilities of street traction in this country. He was astonished to find so little progress had been made in the carriage of goods on tramways, and he criticised the present attitude of the House of Commons in relation to municipal Bills asking for these powers. Last year the Bradford Corporation was unsuccessful before Parliament, and Mr. Spencer attributes this to the fact that so many corporations already possess these powers but do not exercise them.

The use of trolley omnibuses met with Mr. Spencer's cordial approval, as indeed it should, for the Bradford Corporation were, with the Leeds Corporation, the first to obtain Parliamentary powers to adopt them, and arrangements are being made for an installation to be put down. He thought accumulator traction was worthy of more than passing interest, and believed developments in this direction might be looked for. Improvements in tramway motors, he said, were rapidly taking place, and even now a guarantee of from ten to twelve per cent. higher electrical efficiency for tramway equipments could be obtained than formerly. Car equipments were improving so much in the direction of greater efficiency that it was not at all improbable that in the future the cars could be propelled with 50 per cent. less energy than at present; in this connection he pointed out that present cars wasted, by the wearing away of brake shoes and tyres, 40 per cent. of the energy supplied. As assisting in this direction, progress should be made with regeneration.

References were made to the work of the Corrugation Subcommittee, which is at present being carried on, and also the Conference between the Association and the Incorporated Municipal Association with regard to the price of current to be charged to municipal tramways departments by municipal electricity departments. The concluding portion of Mr. Spencer's address urged municipalities to recognise that tramway concerns must be conducted on strictly business lines, which even now is not recognised in many places.

In the course of his address, Mr. Spencer also referred to the arrangements which are being made for the incorporation of the Association.

The Presidential Address was followed by a Paper on "The First Decade of Municipal Tramway Working," by Alderman A. Flint, Chairman of the Leicester Tramways Committee. The author said that the municipalisation of tramways had been necessary and wise, and had been justified by the results. At present there are 176 municipal tramway undertakings in the United Kingdom, of which 92 are leased or worked by either corporations or companies. The 84 purely municipal undertakings had a total reserve fund to 1909 of £4,200,462. They have paid to sinking fund account £6,619,450, and have paid in relief of rates £2,481,760. The author urged the need for placing all net profits to reserve, and argued that it was a mistake to pay anything in relief of rates unless there is already a large reserve fund. The Paper also dealt with the improved conditions now enjoyed by tramways employees, and the possibilities in the direction of carrying goods on tramways. It was also suggested that, although the obligation upon a tramway authority to keep in repair the centre of the track and 18 in. outside might have been quite right under the old conditions of horse cars, yet it now might be revised.

The lengthy discussion on this Paper was mainly devoted to the policy which Tramways Committees should adopt. A complaint was made that the low fare charges in large populous towns set the running for the smaller towns which could not afford such low fares, and consequently met with financial disaster. A similar principle applied to wages and hours of labour for employees. Cheaper fares to certain classes might, it was thought, be granted out of philanthropy or pity by a Corporation, but the Tramways Committee should expect the Corporation to meet any loss in respect of it. Mr. J. M. McElroy, General Manager at Manchester, urged the laying of tramways into districts in order to develop them, instead of waiting for the districts to develop themselves. Mr. J. R. Salter, representing the Tramways & Light Railways Association, took the opportunity of pointing out that the onerous conditions objected to by Tramways Committees, with regard to repairs of roads, &c., were also objected to by Tramway Companies, but the latter got very little assistance from the Corporations. In the discussion, the point was again emphasised by several Chairmen of Tramway Committees that any relief of rates from the tramway revenue should be postponed until sufficient reserve fund, &c., had been set aside. This is a point of view which tramway managers have been impressing upon their chairmen for many years, but hitherto without much success, and it is gratifying to see that the chairmen are now adopting the same view.

The next Paper, by Mr. J. W. Dawson, Assistant Engineer to the Bradford Corporation Tramways, described investigations which had been undertaken with the object of ascertaining the comparative durability of the various grades of brake shoes used on tramcars in this country, together with their wearing effect upon steel tyres. Twenty different grades of shoes had been tested. Figures were given of the wearing properties of shoes and tyres run under ordinary service conditions, and the results showed that the individual shoes of each group vary considerably in durability. The rate of wear of soft grey iron shoes was more uniform than that of other groups, and the most excessive wear was obtained with white iron. Similar large variations were found in the wearing effect upon tyres. The author advocated a microscopical analysis, in addition to chemical analysis and physical tests, so that the particular structures producing the different characteristics of the shoes might be indicated, and a standard specification drawn up. In the author's opinion, it matters little from the point of view of cost which suffers most, the shoe or the tyre. When it is desirable to economise energy for brake application and to reduce mechanical stress upon brake gear to a minimum, it is best to use a shoe with a high coefficient of friction. The discussion, whilst emphasising the advantages of the investigations carried out by Mr. Dawson, indicated a difference of opinion amongst tramway managers as to the possibility of evolving a standard specification for brake shoes. Mr. A. L. C. Fell, of London, for instance, pointed out that the slightest variation in the tyre or local conditions, such as whether the paving was of granite, macadam, or wood, were important factors militating against standardisation, other factors being the gradients and speed. On the other hand, Mr. J. M. McElroy, of Manchester, thought the matter of such importance as to warrant investigation by a Subcommittee.

On Thursday a Paper was read by Mr. A. Baker, General Manager of the Birmingham Corporation Tramways, on "Tramways in Relation to Town Planning." The Paper was a plea for the construction of roads sufficiently wide to carry a double line of tramways in the centre and roadways for ordinary traffic on either side. Mr. Baker claimed that under the Town Planning Act of 1909 land for such roadways could be obtained cheaply, and he mentioned the figure of from £100 to £200 per acre. In this way it was suggested that instead of developing tramways outwards from the centre of a city, property several miles out should be "town planned," and the roads built towards the big city. With such a roadway Mr. Baker would considerably cheapen the cost of tramway construction, either by the use of macadam

Digitized by Google

paving, which would not be worn out by ordinary traffic or by leaving the space between the rails filled in with turf. He put the saving in cost of construction at some £3,500 per mile of double track, irrespective of the saving in maintenance. Incidentally, the Paper condemned the trolley omnibus system, the author believing it to be the best policy to lay down tramways in the first place, and, if necessary, face a loss for a year or two. It may be mentioned that Mr. Baker's ideal roadway has a maximum width of 91 ft., and provides for two 10-ft. foot-paths, two roads for vehicles, each 24 ft. wide, and a way for tramways 23 ft. wide, and he expects to have such a road in operation near Birmingham within the next 12 months.

The Paper was severely criticised by a large number of speakers, principally on the cost of land mentioned by Mr. Baker, and his condemnation of the trackless trolley system.* A figure of from £500 to £1,000 per acre was mentioned in regard to Liverpool, and £1,200 per acre at Southampton. Practically every speaker looked to the trackless trolley system as the best means of developing districts near populous centres, and it was left to Mr. J. Hamilton, of Leeds, to point out that Mr. Baker appeared to mean that he would not have the trackless trolley system in connection with such schemes as he was advocating in the Paper, as in that case new roads were being built, and with the cheaper form of construction proposed the capital cost would probably be very little, if any, more than the trackless trolley system. He thought every one would admit that this was the chief difference, and that no advantage was claimed in running expenses for the trackless trolley system over tramways. Councillor Hill, of Bournemouth, who also mentioned that a new roadway would be opened at Bournemouth shortly somewhat on the lines advocated by Mr. Baker, preferred tramways on either side of the road near the footpaths, and incidentally mentioned that he looked forward to a "silent" tram in the future.

The final Paper was a report on "Lubrication of Car Bearings," which had been prepared by Mr. E. Cross (Rotherham), Mr. R. L. Acland (Chesterfield), Mr. P. J. Pringle (Burton-on-Trent), and Mr. T. R. Smith (Leicester). The Committee have found that oil is most in favour, and that out of 56 tramway undertakings, only 7 use grease. From replies received from all the tramway undertakings in the United Kingdom it is found that the cost of oil varies from 5½d. to 2s. per gallon, and, indeed, this large variation has manifested itself throughout. So startling are these variations that the Committee is unable to account for them. Rotherham are able to run their motors 51,000 miles for 1/16th in. wear on the armature bearings, while at Bournemouth the corresponding figure is 3,000, and at Aberdeen and Blackpool about 5,000; Belfast are able to make their suspension bearings last for 27,000 miles, when in Burton-on-Trent they only lasted 5,300, and at Lincoln the axle bearings have run 106,500 miles, at Darwen 350,000, at Liverpool 5,000, and Manchester 3,600. Messrs. Cross & Pringle quite independently, and unknown to each other, have been experimenting with a system of chain lubrication with the older type of DK motor in order to obtain the advantages of the "ring" system as far as possible. Mr. Acland is also carrying out experiments with his Westinghouse (46 M. type) motors in a similar direction. It is recommended that a system of ring lubrication or its equivalent should be insisted upon in all new motors, as excellent experience has been obtained in a few undertakings who have had these motors installed for a sufficient time to give a decided opinion. With the ring system the wastage of oil is practically nil, and, consequently, a higher grade of oil can be used without excessive cost. The better supervision of the work of the "greaser" than is generally the case was insisted upon.

There was only a very short discussion upon this Paper, and so many explanations were asked of various figures that the Committee were asked to continue their investigations, as the results tabulated were admittedly incomplete. Mr. C. Hill, Tramway Manager at Bournemouth, one of the speakers, said that if he could obtain such good results as some of the undertakings mentioned in the Paper with his present equipments, he would save some £300 per annum.

At the annual general meeting on Friday, Mr. J. Dalrymple, General Manager of Glasgow Corporation Tramways, was elected President for the year 1910-11. Mr. H. E. Blain, Tramways Manager at West Ham, was elected Vice-President. The Conference next year will be held in Glasgow.

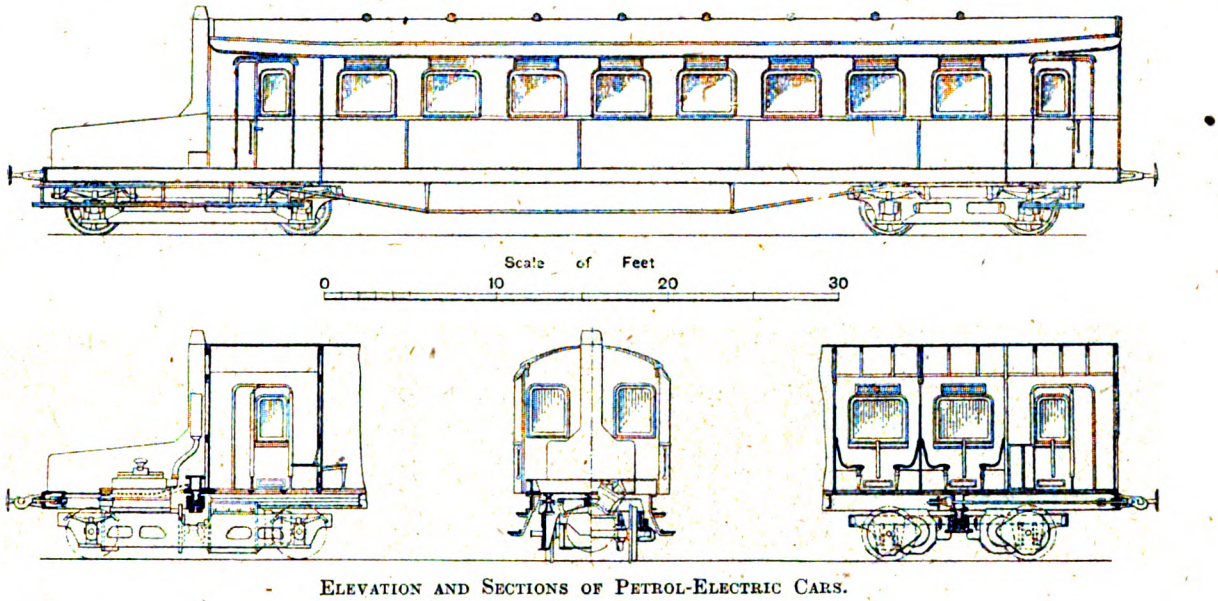
* We employ the expression "trackless trolley system" as it was used by all the speakers and is now becoming general; but it is an exceedingly bad designation, as the only part of the system which is not trackless is the trolley. Trolley omnibus is the proper name for these hybrid vehicles.—ED. *E.E.*

FEED WATER AND BOILER EXPLOSIONS

A BOARD of Trade Report has been issued concerning a series of small explosions which occurred to tubes of a water-tube boiler at the Whitehaven Corporation Electricity Works in May and June last. In each case a small hole had been formed in the tube, through which the hot water escaped. At the last explosion, on June 8th, a hole ⅜ in. in diameter was formed in the tube, through which the hot water escaped, and the fires were put out. The explosions appear to have been due to internal wastage of the tubes, caused by the corrosive action of the feed water, which at the time was not being obtained from its usual source. The town water supply had to be cut off owing to the sticking of a scraper in one of the mains, and, consequently, water from a stream containing a large amount of impurities had to be utilised for feed. Five days later the tubes in two boilers began to give trouble, which became so serious that the whole boiler plant had to be temporarily shut down, as the erection of the new boiler was not completed. The inspector emphasises the importance of good quality of feed water, and points out that serious explosions are liable to take place from corrosion of tubes.

IMPROVING THE COLOUR OF THE LIGHT FROM THE MERCURY VAPOUR LAMP

THE *Electrical Review and Western Electrician* (Chicago), reports an interview with Mr. P. Cooper-Hewitt, the inventor of a well-known form of mercury vapour lamp, in which is described a method which he has lately devised to improve the colour of the light emitted by these lamps without any other auxiliary source of illumination. The light from the ordinary mercury vapour lamp is particularly deficient in red rays as compared with daylight. Mr. Hewitt has, however, succeeded in producing a selective fluorescent reflector, which is capable of absorbing the rays of higher frequency from the lamp and emitting rays of the lower frequency required, acting, so to speak, as a light transformer. By this means, it is claimed that a sufficient supply of red rays can be obtained to make the quality of the light approximate to daylight. Tests of a lamp fitted with the reflector are reported to have given very good results as regards colour-matching. The reflector consists of a trough round the lamp tube with a white enamelled surface, coated with a film of fluorescent material, tinted with rhodamine, and it is stated by the inventor that about the same amount of light as given out by four standard candles can be given out per square inch of surface.



Bare Aluminium Wire for Tramway Motor Field Coils.—At the annual meeting of the Verein Deutscher Strassenbahn- und Kleinbahn-Verwaltungen, Herr Paulsmeier, chief engineer of the Hamburg tramway system, stated that there were already some 30 motors on the Hamburg tramcars with field coils of bare aluminium wire, and that 52 further coils had been ordered. The absence of insulating covering and the use of wire of square-section resulted in the aluminium coil taking up the same space as a copper coil in spite of the larger wire required. By their use, the weight of a tramway motor of normal size was reduced by about 100 lbs. This, and the fact that the coils are not so easily ruined by overheating and vibration as copper coils appear to be the chief advantages. It appears that eleven other tramway undertakings in Germany are experimenting with aluminium coils, and report favourably. Most of the coils employed have asbestos paper or linen insulation between the separate layers.

Electric Shocks.—At the recent annual meeting of the British Medical Association in London, Dr. S. Jellinek, of Vienna, described several cases of electric shock, and pointed out some of the conditions determining the effects. A pressure as low as 65 volts had been known to kill, while 10,000 volts had been successfully withstood. The path taken by the current through the body was of the utmost importance, and the unfortunate occurrences at some of the American electrocutions had been due to neglect of this fact. The physical and mental condition of the victims were also determining factors, and the shock was most dangerous when it came as a surprise. Death might occur through paralysis of the heart or through stoppage of the respiration. Dr. Jellinek considered direct-current more dangerous than alternating-current for equal voltages. Electrical burns resulted in special lesions of the skin, which were painless and quite different to ordinary burns. Electric shock commonly caused a rupture of fine blood-vessels in the brain, and consequently it was advisable to raise the head of the victim. He also advised, in first aid, the puncture of the spinal cord, artificial respiration, and venesection.

PETROL-ELECTRIC CARS ON THE PRUSSIAN STATE RAILWAYS

THE first petrol-electric car of the Prussian-Hessian State Railways was set in operation in the year 1907, and since then has been running continuously on the sections Friemersheim-Menzelen and Trompet-Homberg. Such satisfaction has been given by the car, that the railway authorities last year ordered eight further cars of a similar nature, but with several improvements suggested by experiences with the original. An elevation and sections of the new design, which is described in a recent article in *Elektrische Kraftbetriebe und Bahnen*, are given in the accompanying figure. As in the original car, the engine, &c., is completely separated from the main body, and the use of the Ward Leonard control system has also been retained. The body is supported on two simple two-axle bogies. One carries the generating plant comprising engine, dynamo, exciter, and fan, and the other carries two motors. The placing of the engine by itself on the one bogie is claimed to have many advantages, including the minimising of vibration of the body, and the possibility of changing the whole generating plant without interfering with the rest of the car. It was found that the vibration of the engine was most unpleasant when the car was stationary, and means have been provided in the new cars to reduce the speed during halts from the normal of 700 r.p.m. to about 200 to 250 r.p.m. Each car has a seating capacity of 100 persons, and when fully loaded can attain a speed of thirty miles per hour on the level. The six-cylinder V-type engine is rated at 100 h.p., and is coupled to a 60-kw. dynamo generating at pressures up to 300 volts, according to the excitation. The 70-volt exciter supplies current for lighting the car also. Each of the two motors is rated at 82 h.p. on the one-hour rating, and is of the same pattern as those used on the accumulator cars of the Prussian State Railways (see ELECTRICAL ENGINEERING, Vol. IV., p. 522). The motors are of the A.E.G. Co.'s manufacture, and are provided with interpoles. The weight of the car fully loaded is 47 tons. The engine is started by compressed air. For heating the compartments, the cooling water of the engine is employed. The design is the combined product of the Allgemeine Elektricitäts-Ges., the Gasmotorenfabrik Deutz, and the railway carriage builders, the Düsseldorfer Eisenbahnbedarf, who have worked to the instructions of Oberbaurat Wittfeld, of the Prussian State Railways. The railway authorities of the Duchy of Oldenburg have also a similar car on trial.

ELEVATION AND SECTIONS OF PETROL-ELECTRIC CARS.

NEW SINGLE-PHASE LOCOMOTIVES

SHORT descriptions with outline drawings of some recent electric locomotives were given in ELECTRICAL ENGINEERING, January 20th, 1910, p. 44. These included two three-phase, one continuous-current, and one single-phase locomotive. The latter was of the New York, New Haven & Hartford Railway, and had four pairs of driving wheels coupled to four 350-h.p. Westinghouse single-phase motors through flexible gearing, and two pairs of guiding wheels. With this may be compared three single-phase locomotives, descriptions of which appeared recently in *Elektrische Kraftbetriebe u. Bahnen*.

A 2,000-h.p. standard gauge locomotive built for the Lötchberg Tunnel Railway by the Maschinenfabrik Oerlikon is illustrated diagrammatically in Fig. 1. The six wheels of each of the two three-axle bogies are coupled together and driven through spur gearing and coupling rods, the gear ratio being 1 to 3¼. The motors are of the Oerlikon W.B. pattern, each developing 1,000 h.p., and weighing 9·8 tons without gear. Of the total weight of 86 tons, the electrical equipment is responsible for

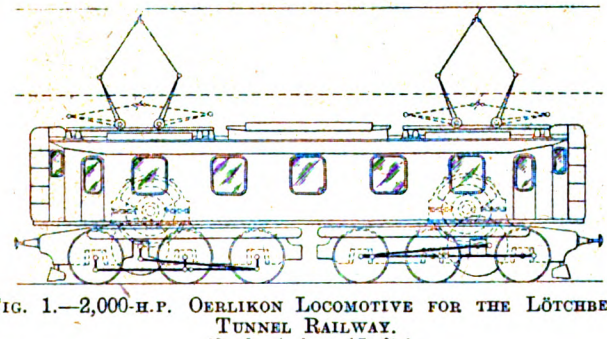

FIG. 1.—2,000-H.P. OERLIKON LOCOMOTIVE FOR THE LÖTCHBERG TUNNEL RAILWAY.
(Scale 1 in. = 15 ft.)

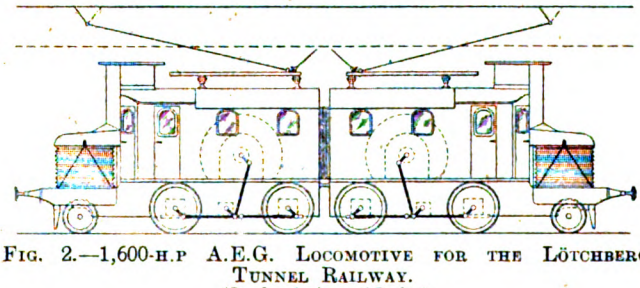

FIG. 2.—1,600-H.P A.E.G. LOCOMOTIVE FOR THE LÖTCHBERG TUNNEL RAILWAY.
(Scale 1 in. = 15 ft.)

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 22nd, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

20,057/09. **Electroplating.** S. O. COWPER-COLES (London). The articles to be plated are placed in a drum containing the electrolyte, and mounted on rollers so as to be capable of rotation. The stationary anodes are suspended inside the drum, and insulating screens are provided to prevent deposition taking place on the inside surface. Two figures.

20,230/09. **Wireless Telegraphy.** G. MARCONI and MARCONI'S WIRELESS TELEGRAPH CO., LTD. Aerials are made directive by arranging the antennae horizontally in a vertical plane passing through the stations. The antenna is brought very close to the ground, and to avoid the loss in efficiency, due to the high resistance of the surface of the ground underneath, wires are buried or laid at the surface underneath the antenna. Three figures.

22,715/09. **Arc Furnace for Treating Gases.** J. Y. JOHNSON (*Badische Anilin & Soda Fabrik*). In arc furnaces for fixing atmospheric nitrogen, as described and illustrated in ELECTRICAL ENGINEERING, June 3rd, 1909, Vol. IV., p. 515, the water-cooled iron electrode at the base of the tube where the gases enter is constructed in a tubular form, and the arc is caused to move about over the surface of this electrode so that it is not consumed. In one form of the furnace the gases enter through the hollow electrode. Two figures. Another specification by this firm (No. 20,129/09) describes forms of the above furnace, in which the air passes down the tube near the outer wall, and then reverses and returns along the centre in the path of the arc. In one case the air is fed in at the centre of the tube, and flows to the two ends. Five figures.

25,288/09. **Series Lamps.** E. and N. R. BOOTH (Halifax). In lamp groups comprising two or more lamps in series, a substitutional resistance is connected across each lamp through an insulating device, which breaks down when the full pressure of the circuit is across it, and this occurs when a lamp fails. To ensure the breaking down of this device and the connection of the substitutional resistance, a further shunt circuit containing an inductance is automatically made and broken directly a lamp fails. The inductive "kick" on breaking this circuit ensures the substitution of the resistance. Two figures. The "Stearn" lamp fitting embodying the original device was described in ELECTRICAL ENGINEERING, April 30th, 1908, Vol. III., p. 651.

29,953/09. **Wiring Conduit.** H. HIRST and T. TAYLOR (General Electric Co., London). To render metallic conduit electrically continuous, two longitudinal grooves are formed at each end of the coupling or fitting, and a long staple is driven into the grooves after the tube has been inserted, thus cutting through the enamel of both fitting and tube, and ensuring a good electrical connection. Three figures.

6,397/10. **Supports for Metal Filament Lamps.** WOLFRAM LAMPEN A.-G. A spring support allowing for vibration in all directions consists of a carbon filament fixed at one end to the central stem, and provided with a hook or loop for holding the metal filament at the other end. A larger loop or coil in the centre of the arm gives the desired elasticity. Two figures.

6,868/10. **Three-phase Arc Lamp.** E. KÖNECKE (Cologne). Each of the three electrodes is controlled by a separate eddy-current disc motor provided with current and pressure windings corresponding to that particular electrode, so that each electrode is controlled by the current in the corresponding phase. One figure.

7,318/10. **Motor Starter.** ADAMS MANUFACTURING CO., LTD. (*Cutler Hammer Manufacturing Co.*). This covers a starter for induction motors, in which two variable resistances are provided in two of the rotor phases, the third resistance being constant and only cut out when the motor is up to speed. Six figures.

10,054/10. **Cable Conduit.** J. and A. ETTLINGER (Karlsruhe). The cable is laid at the bottom of the trench, and is covered by a number of arched castings arranged so that alternate castings overlap the edges of the adjacent ones. The whole conduit is flexible and the cable is readily accessible. Sand or other loose covering may be placed under the castings. Two figures.

Opposition to Grant of Patent

16,076/09. **Metal Filament Lamps.** POPE'S ELECTRIC LAMP CO., LTD. (*C. Trenzen*). Opposition has been entered to the grant of this patent. It covers a method of joining metal filaments to their leading-in wires by cementing the joint with a paste of finely divided tungsten and a solution of ammonia, and afterwards reducing in an inert gas by means of an arc between iridium electrodes. About 2 per cent. of gelatinous silicic acid may be added to the ammonia paste, and this causes tungsten silicide to be formed which melts easily and forms a good electrical connection.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: METAL JOINTING CO. and HARDEN [Lead joints] 28,708/09; SATTLER [Cable-making machinery] 1,290/10.

Dynamos, Motors, and Transformers: A.-G. BROWN, BOVERI & CIE. [Starting machines] 20,827/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Transformers] 23,649/09; MAVOR & COULSON, LTD. [Ventilation of motors] 26,005/09; SIEMENS BROS. DYNAMO WORKS (*Siemens-Schuckertwerke Ges.*) [A.-C. commutator motors] 6,124/10; ALLGEMEINE ELEKTRICITÄTS-GES. [Control of induction motors] 8,621/10.

Electrometallurgy and Electrochemistry: ROMAN [Electroplating] 5,369/10.

Heating and Cooking: BERRY, 20,639/09; KENT, 22,997/09.

Instruments and Meters: WIMPERIS and ELPHINSTONE [Instrument for measuring acceleration, gradients, &c.] 20,231/09; SIEMENS BROS. DYNAMO WORKS and LYDALL [Meters] 20,815/09; CHAMBERS [Electrical acoustic instruments] 21,441/09.

Storage Batteries: TUDOR ACCUMULATOR CO. (*Accumulatoren Fabrik A.-G.*) [Plate separators] 25,273/09.

Switchgear, Fuses and Fittings: THOMAS and THOMAS [Current collectors] 15,682/09; IMER [Dust-proof globe reflectors] 19,949/09; SHAW [Ceiling-rose with plug connections] 20,435/09; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [A.-C. voltage regulation] 23,416/09; CAMPBELL and ROBINSON [Lamp-globe fittings] 5,368/10; RUSSELL and HUTSON [Lamp-holder] 15,933/10.

Telephony and Telegraphy: NEUHOLD [Automatic telephone exchanges] 8,228/10; RABINSOHN [Oscillation generator for wireless telegraphy] 9,539/10; HÖFERMANN [Disinfecting device for telephones] 15,318/10.

Traction: MITCHELL [Operating tramway points] 21,471/09; GRESHAM [Vacuum brakes] 27,803/09; WILLIAMS [Signalling] 29,525/09.

Miscellaneous: VENNER and GRIESBACH [Electric mechanism for writing and colour-changing signs] 18,583/09; BOWELL [Electric clocks] 20,496/09; WILLIAMS [Signs] 24,283/09; WILLANS & ROBINSON, LTD., and IZOD [Turbines] 25,673 and 26,847/09; ROSENBERG [Electric massage apparatus] 4,804/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: GRAVDAHL 19,625/10.

Electrometallurgy: THOMSON [Furnaces] 15,164-5-7-8-9/10.; FITZGERALD [Furnaces] 15,166/10.

Incandescent Lamps: MALACHOWSKI, 10,041/10.

Instruments: HARTMANN BRAUN A.-G. [High-frequency resonance measuring instruments] 14,925/10; ALLGEMEINE ELEKTRICITÄTS-GES [Maximum demand meter] 20,446/10.

Switchgear: KALLMANN [Resistances] 19,993/10.

The following amended Specifications can now be obtained.

PARSONS, STONEY and LAW [Electrical marine propulsion] 6,177/09; MAXANER [Combined centifugal fan and motor] 15,659/09.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: BRITISH THOMSON-HOUSTON CO. (*Union Elektricitäts-Ges. and A. P. Zani*) [Starting of induction motors] 11,843/99; C. H. PRÖTT [Bearings for vertical shaft motors] 12,658/03.

Electric Ignition: F. REICHENBACH [Magneto] 12,886/03.

Electrometallurgy, &c.: G. A. GOODSON [Plating wires] 3,798/05.

Switchgear, &c.: W. P. THOMPSON (*Chemische Elektrische Fabrik "Prometheus" Ges.*) [Silicon resistance units] 12,707/04; H. T. HARRISON [Street lamps and reflectors] 13,088/04.

Telephony, &c.: D. MURRAY [Operating keyboards by perforated tape obtained from telegraphic punching machine] 11,778/99; C. E. KELWAY [Determination of distance of ships by Hertzian waves] 12,124/99; P. M. JUSTICE (*Rowland Telegraphic Co., U.S.A.*) [Telegraph transmitters] 12,956/02.

Traction: H. DOLTER [Studs for surface-contact system] 11,776/99; H. W. SYKES [Station indicators] 11,877/05; C. H. ROBERTS [Third-rail insulators] 12,023/05; C. BRIGHT [Fare and position indicators] 22,897B/05.

Miscellaneous: W. J. PECKETT [Combined electric door-bell and knocker] 12,873/03; C. BRIGHT [Vacant seats indicator for hall and theatres] 22,897A/05.

Digitized by Google

42 tons. A normal speed of 26 m.p.h. and a maximum speed of 44 m.p.h. will be attained. Current is supplied at 15,000 volts, 15 cycles.

Fig. 2 shows a 1,600-h.p. locomotive for the same railway by the Allgemeine Elektricitäts-Ges. This consists of two units closely coupled together, each unit having four coupled driving wheels and a pair of guiding wheels. Each unit is driven through coupling rods by an 800-h.p. W.E. 151 motor weighing 13·5 tons. The total weight of the locomotive is 93 tons, of which 50 tons is accounted for by the electrical equipment. It is designed for a speed of 47 m.p.h.

The third locomotive is one of 14 constructed for the St. Pölten-Mariazell narrow-gauge railway in Austria by the Osterreichische Siemens-Schuckertwerke-Ges. This is a 0·76 m. (2½ ft.) gauge 600-h.p. locomotive, and takes single-phase current from an overhead wire at 6,500 volts, 25 cycles. As shown in Fig. 3, it has two three-axle bogies with the three axles of each coupled together, and driven through spur gearing and coupling rods. The gear ratio is 1 to 3. The motors are Siemens-Schuckert commutator type W.B.M. 350. They are only semi-

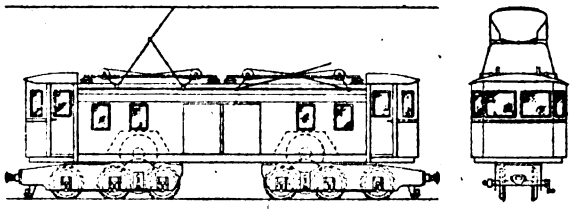

FIG. 3.—600-H.P. SIEMENS-SCHUCKERT LOCOMOTIVE FOR AN AUSTRIAN NARROW-GAUGE RAILWAY.
(Scale 1 in. = 15 ft.)

enclosed, and have natural ventilation. Each develops 300 h.p. at 700 r.p.m., and is supplied at 250 volts through a 490 K.V.A. transformer. The total weight of the locomotive is 48 tons. It is designed for a maximum speed of 31 m.p.h.

Wireless Telegraphy.—The third International Radiotelegraphic Conference will be held in Berlin in the early spring of next year. Invitations are now being issued to the delegates of the various nations who participated in the previous Conference.

According to the *Australian Mining Standard*, New Zealand is to have five wireless stations, including that at Doubtless Bay. The other four will be established at Gisborne, on the east coast of the North Island; Sumner (near Christchurch), on the east coast of the South Island; Cape Farewell, the north-west point of the South Island; and the Bluff, in the extreme south. The stations at Doubtless Bay and the Bluff will be high-power, with an effective radius of 1,250 miles, the others being medium-power and having an effective radius of 500 miles. Tenders are now being invited.

A British Consular report states that the wireless telegraph installation at Kiungchow (China), is so frequently out of action that it is of very little practical use, either for typhoon warnings or commercial purposes.

The new Marconi station at Glace Bay, Nova Scotia, now working the transatlantic service, covers, with its aerials, 150 acres of ground. The antennae of the fan-shaped aerial, which is about 1,000 ft. in width, are 6,000 ft. long, and these are supported by 30 masts, each 250 ft. high. The instruments have a working radius of 3,000 miles, although the distance to the Clifden station is only 1,700 miles.

With further reference to our note on the experiments carried out by H.M.S. *Bonaventure* and a flotilla of submarines at Torbay, we learn that submarine D 1 is equipped with wireless apparatus, and an aerial about as high again as the periscope, and it is stated that mutual communication was successfully established between the cruiser and the submarine when the latter was submerged to such a depth that the top of the periscope was just above water.

Mr. Marconi, who is now on board the Italian-Lloyd steamship, *Principessa Mafalda*, has received wireless messages from Clifden, Ireland, and Glace Bay, Canada, up to a distance of 3,500 miles in daylight. A kite was used for the support of the aerial wire. The previous longest distance over which wireless messages have been received is 1,750 miles.

The wireless telegraph station at Liverpool is to be removed inside the Seaforth Barracks. This move is in connection with the scheme for national defence. The *Liverpool Post* states that Portsmouth, as a wireless station, is to be abolished, and a new station erected at Ventnor. Since the Government took over all the coast stations, the policy has been adopted of removing them to Government land. It is expected that this work will be completed by the end of the year.

A commencement has been made with the construction of the Admiralty wireless telegraph station at Scarborough.

THE PHYSIKALISCH-TECHNISCHE REICHSANSTALT

THE report of the Physikalisch-Technische Reichsanstalt, the German equivalent of the National Physical Laboratory, on the work of the year 1909, includes some matter of general electrical interest. Extremely high accuracy in calorimetric measurements has been rendered possible by the use of a mercury resistance thermometer, comprising a long capillary quartz tube containing mercury, and provided at each end with two platinum wire electrodes. This capillary tube is bent zig-zag, and enclosed in a larger sealed tube. Two such thermometers gave readings between 0° and 100° C. agreeing within a few thousandths of a degree. Comparative tests have been continued with Manganin resistance standards; and readings extending over 16 years show that the average obtained by comparison with five mercury standards was constant. Measurements with the silver voltameter are being continued. The work on standard cells has progressed considerably. It has been found that mercury sulphate preparations vary in their electrochemical activity after having been kept in a dry condition for some months, but that this alteration can be prevented by preserving the freshly prepared substance in a vacuum or in a cadmium-sulphate solution. Preparations with exactly similar electrochemical activity and time-constants can now be made up, and 67 cells have recently been constructed for the Laboratory, all of which agreed within a few parts in a hundred-thousand shortly after setting up. Preparations are being made for geometrical measurements in connection with the absolute determination of the ohm. A new method has been devised for the measurement of magnetic fields, with which relative magnetic measurements in fields up to 2 gauss with an accuracy of 0·1 per cent. can be obtained.

Experiments conducted with electricity meters of Siemens-Schuckert, A.E.G., and Aron manufacture have shown that on varying loads the readings are unaffected by the inertia of the moving parts. Other tests on ampere-hour mercury meters of the type in which an armature connected as a shunt across a resistance rotates in the field of a permanent magnet have shown that the inaccuracies frequently noticed are not due, as has been suggested, to the effects of mercury vapour. Experimental work has also been carried out with the mercury-vapour rectifier, and with electrometers for A.-C. measurements. Apparatus has been devised for generating alternating currents of invariable frequency for accurate measurements with the vibration galvanometer. This has been used with considerable success in connection with the comparison of inductance and capacity standards.

Tests on fuses have indicated that the structure of the metal undergoes considerable alteration during prolonged overload. A heavily loaded wire of 1 mm. diameter gradually increased in resistance to the amount of 20 per cent., and eventually melted after 12 weeks' continuous running. A testing apparatus for repeatedly opening and closing switches in a similar manner as would happen with manual operation has been constructed. A suggested method of measuring high liquid or gaseous pressures by means of a long fine wire wound over a tube has been investigated. The tube expands radially under pressure, and causes the wire to lengthen and show an increase in resistance. It is stated that the practical value of the method is doubtful owing to the very accurate resistance measurement necessary. Considerable progress has been made in the magnetic laboratory, where experiments at high induction by an improved Ewing's Isthmus method and other tests have been carried out. The influence of the chemical composition and treatment of iron stampings on the magnetic properties is still being investigated. Electrolytically produced iron, after expulsion of the contained hydrogen by annealing in a vacuum, was found to be so free from coercive force that the production of iron totally free from hysteresis seems more probable. It has been found possible to produce iron having almost any desired hysteresis loop by different treatment, and it appears that the permeability and retentiveness can also be fixed at will within certain limits.

In the section devoted to optical research, reference is made to the attempts of the English, French, and American authorities to establish an "International Candle" of the value of 1·11 Hefner candles. It is stated that this cannot be supported by Germany, as the definition is open to many objections. The name "International Candle" is protested against.

Turin Exhibition.—The Associazione Elettrotecnica Italiana is arranging an International Electrotechnical Congress in connection with the Exhibition at Turin next year.

CATALOGUES AND PAMPHLETS RECEIVED

"SPOOKIE" SHADES.—The latest design of Spookie night watch lantern is illustrated on a card from Simplex Conduits, Ltd. The new pattern is square instead of round, and the use of glue, which might become soft owing to the heat of the lamp, in fixing the roof, has been avoided.

ELECTRIC COOKING.—An attractive folder is being issued by the British Prometheus Co., Ltd. (Salop Street Works, Birmingham), for distribution by the trade to private consumers, to call attention to the possibilities opened up by their heating and cooking apparatus.

PRESERVATIVE PAINTS.—An attractive booklet describing the properties and uses of the well known P. & B. preservative paints has been issued by the Ruberoid Co.. Ltd. (81-83 Knightrider Street, London, E.C.). These include a black waterproof paint for cables and conduits and water pipes; a special paint for boilers, steam pipes, and other hot surfaces; a flexible iron paint for metal work, such as the underframes of tramcars, trolley-poles, &c.; a damp-proofing paint for the interior surface of brick walls, and various roof paints. A price list is included.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

INSTRUMENTS.—Messrs. Everett, Edgcumbe & Co., Ltd. (117 Victoria Street, Westminster), have sent us a card containing humorous illustrations by John Hassall and advertising their instruments.

ELECTRIC RADIATORS, LIGHT AND HEAT BATHS.—The Dowsing Radiant Heat Co., Ltd. (24 Budge Row, Cannon Street, London, E.C.), have just issued new catalogues and price lists for the coming season. An attractive booklet illustrates thirty-six designs of luminous radiators at prices ranging from 25s. to £13. These include simple iron-frame radiators for general purposes, artistic patterns for sitting-rooms, and enclosed designs. Consumption, dimensions, and price are given in each case. A novelty is an eight-lamp radiator consuming two units per hour and arranged with the lamps in two tiers, with artistic metal collars round the ends, giving a very neat appearance. The latest patterns of the firm's "Solarium" light and heat bath are described and illustrated in another leaflet. A cheap portable pattern for home use, containing four lamps with special reflectors, is listed.

ELECTRIC BELLS.—Messrs. Siemens Brothers and Co., Ltd. (Caxton House, Westminster), have brought out a new catalogue of electric bells and accessories. The domestic bells range from the inexpensive patterns with japanned iron covers and wrought-iron frames stamped in one piece, to high-finished bells on walnut or teak bases. Watertight bells on the diaphragm principle, a large selection of pushes, switches, and special contacts and indicators are included.

HIGH-SPEED ALTERNATING-CURRENT MOTORS.—A leaflet from the A.E.G. Electric Co., Ltd., illustrates a three-phase motor, which has been designed for direct coupling to a turbo-blower. It is of 2,800 h.p. at 1,500 r.p.m., with a periodicity of 25. The motor is self-ventilating, and is fitted with air ducts secured to each bearing shield. The bearings have forced lubrication and are water cooled. The outlying slip rings can be totally enclosed.

INCANDESCENT LAMPS.—An advance copy of a comprehensive list of metal filament lamps is to hand from the Sunbeam Lamp Co., Ltd. (Park Road, Gateshead). It is important to notice that all these lamps are entirely British made, including the bulbs, which are made at the company's own glass works at South Shore Road, Gateshead. The firm also make their own tungsten filaments. A considerable number of sizes of metal filament lamps are listed, ranging from 8 to 400 c.p., for circuits from 25 to 200 volts. The special lamps include candle lamps for various voltages up to 135 volts, 24-volt train-lighting lamps, and the latest addition to the series is the group of patterns of 4, 6, and 8 volt battery lamps for motor car lighting, &c. A complete series of carbon lamps is also included. The firm have issued an attractive new show-card calling attention to these lamps.

LOCAL NOTES

Aberdare: *Tramways.*—A tramway scheme is under consideration by the Council.

Canada: *Electric Supply.*—A new company called the Pacific Exploration Company propose to erect a 25,000-h.p. plant on the Pend d'Oreille River, near Waneta. It is rumoured that the Canadian Pacific Railway Co. is interested in the project, and that should the scheme be carried through, the electrification of the company's Crow's Nest line will follow.

Canterbury: *Lighting of Infirmary.*—With reference to the recent decision of the Canterbury Board of Guardians to light the Infirmary by electricity, the secretary of the local gas company has written a letter complaining against this decision, and asks the Board to allow the company to test an incandescent inverted gas burner side by side with a metallic filament lamp. In this way he hopes to test the relative cost, and as he is under the impression that the Board of Guardians decided solely on this question, he has anticipations that the decision will be reversed.

Ceylon: *Telephone Exchanges.*—The Superintendent of Telegraphs refers in his report to the erection of telephone exchanges in planting districts. Planters are now allowed to put up their own lines and exchanges on payment of a nominal royalty as an acknowledgment to the Government monopoly. Telephone stores can be purchased from the Telegraph Department. At the end of last year provisional licences had been granted for four exchanges, the largest of which made provision for 25 lines.

Channel Islands: *Jersey Telephones.*—The Jersey Chamber of Commerce has requested the States to acquire the present telephone system. The matter has been referred to the Public Works Committee.

Coventry: *Purchase of Tramways.*—The Sub-Committee which was appointed a short time ago to consider whether the Council should purchase the undertaking of the Coventry Electric Tramways Co. now recommend that expert advice on the matter be obtained at an expenditure not exceeding £250.

Edinburgh: *Electricity Profits.*—A proposal by the Electric Lighting Committee that the surplus of £7,300 from the electricity undertaking last year should be applied to reducing outstanding loans, has been sent back to the Committee for reconsideration.

Greenock: *Electricity Accounts.*—The electricity accounts for the year to June 30th show a gross profit of £14,345. After meeting capital charges there is a balance of £3,248, of which £1,000 has been carried to reserve. The number of units sold was 5,096,128. The total maximum supply demanded was 2,590 kw.

Grimsby: *Advertising Electricity.*—At the last meeting of the Council, Alderman Pickwell said he doubted whether the return from so much advertising of the Electricity Department justified the expense of the issue of posters on every available piece of Corporation frontage. Mr. W. A. Vignoles, the Borough Electrical Engineer, in reply to a suggestion that there should be central premises to give demonstrations with electrical appliances, pointed out the great cost of this method. He also drew attention to the fact that the advertising already done this year had produced good results. More than twice as many consumers had been connected during the past five months than in the corresponding period of either of the previous two years. The engineer was given permission to continue his usual practice, and to have further posters printed in colours.

India: *Electric Power Scheme.*—In connection with the scheme for supplying electric power in bulk in and around Bombay, the *Financial News* states that an Indian company has just been registered in that town with a capital of £1,250,000. It is stated that the native Princes and Chiefs will provide £1,000,000 towards this amount. Our contemporary also states that one of the first schemes which the new supply will make possible will be the electrification of the Bombay, Baroda, and Central India Railway from Colaba to Virar and the Ghat sections of the great Indian peninsula. The scheme provides for the utilisation of two or three large lakes, and the plant will be erected in sections of 10,000 h.p. It is said that the operations of the Bombay Electric Supply & Tramways Co., Ltd., will in no way be affected by the new undertaking.

Italy: *Imports of Electric Lamps.*—The imports of incandescent electric lamps to Italy last year increased from four to five millions.

Keighley: *Trolley Omnibus.*—The Corporation are asking for the consent of certain outside districts for permission to erect the necessary standards and overhead wires for running trolley omnibuses. The Corporation have approved the Tramways Committee's recommendations to promote a Bill next session asking for powers to instal trolley omnibuses.

Digitized by Google

Kilkenny: *Asylum Lighting.*—The Kilkenny District Lunatic Asylum is now lighted by electricity. The power-house contains two 37 h.p. Hornsby gas engines and dynamos. A storage battery is installed. The total number of lamps is about 700, varying from 8 to 65 c.p. each.

Leicester: *Wiring and Fitting.*—Although it has been common property for some time, the Leicester Gas & Electric Lighting Committee have formally recommended the Corporation not to appal against the injunction restraining the Corporation from wiring and fitting premises for electric supply. It will be remembered that the injunction in question was granted by Mr. Justice Neville in connection with proceedings instituted by a Mr. Utley, an electrical contractor of Leicester.

London: *City of London: Electric Ambulances.*—As indicating the usefulness of the electric ambulances installed in the City by the Corporation, it may be mentioned that last year the two vehicles now in use conveyed 1,607 persons to the hospitals.

New Thames Bridge.—A report is to be drawn up with regard to the Thames bridge which has been projected between Southwark and Blackfriars. The scheme includes a double line of tramways which, after crossing the bridge, will dip underground at Knightrider Street and come to the surface near Goswell Road. The estimated cost of the the whole undertaking is £1,646,988. The London County Council limit their contribution to £300,000, but the members of the City Corporation regard this as inadequate.

Margate: *Tramway Track.*—It is suggested that the track of the Isle of Thanet Lighting & Tramways Co. should be doubled in various parts.

Newport (Mon.): *Tramways Accounts.*—The tramway accounts for the past year show a net profit of £2,322, which is an increase of £700. The number of passengers carried increased from 7,958,760 to 8,134,845.

Oldham: *Electric Supply Boundary.*—The Chadderton Council have given the Oldham Council Corporation power to supply electricity to certain consumers in Chadderton. The Oldham Committee are asking for a general consent to supply, owing to the delays which occur in dealing with each consumer individually. On one occasion a number of applications for current were withdrawn owing to these delays. A sub-committee has been appointed by Chadderton to consider the question and with a view to safeguard the interests of the Council.

Perth (W.A.): *The Tramway Strike.*—A notice has been issued to the shareholders of the Perth Electric Tramways Co. regarding the recent strike of their employees. It appears that the motormen and conductors, after having certain grievances dealt with by arbitration, refused to abide by the award. The Courts refused to alter the award, and the men struck. The local Manager took up the position that he was bound by the award, and that the men were also bound by it. After a strike of a few days the men returned to work.

Plymouth: *Overcrowding of Tramcars.*—In consequence of recent complaints of overcrowding on the tramcars and the intervention of the Board of Trade, the Corporation have issued an instruction to their conductors, which has caused a good deal of amusement locally. They are warned not to allow in the interior of the cars any person or persons in excess of the number for which seating accommodation is provided, except to the number of seven only on the following occasions. The occasions include "Saturdays and Wednesdays from noon, Sundays and holidays throughout the day, every day from 12.30 to 1.30 p.m., 5 to 6 p.m., and 10.15 to 11.15 p.m., and also on the occasion of football and other matches, agricultural and other shows, races, regattas, and public entertainments, and during inclement weather."

Scarborough: *Tramway Service.*—It is stated that the tramway service of the Scarborough Tramways Co. will be suspended during the winter months, owing to the poor support which is given to it during this period.

Seghill (Newcastle): *Electric Lighting.*—Arrangements have been made with the Seghill Coal Co. for lighting the streets by electricity.

Taunton: *Position of Electricity Undertaking.*—As we recently announced, the Corporation have appointed Mr. A. J. Howard Borough Electrical Engineer. In addition, at their last meeting, the Corporation decided to consult an independent engineer to report upon the position of the undertaking generally.

Torquay: *Electricity v. Gas Lighting.*—At the half-yearly meeting of the Torquay Gas Co. last week, the Chairman referred to the lighting of the Torbay Road by arc lamps at a cost of £20 each per annum. He considered that this price compared with gas was simply ridiculous. There was no doubt, he said, that gas was better than electricity for street lighting purposes, and something should be done in order that the ratepayers should see the difference. As a matter of fact, an experiment with this object in view was to be carried out.

Tramway Arbitration.—Mr. Archibald Reed, the arbitrator appointed by the Board of Trade to consider the question of whether the Torquay Tramways Co., Ltd., shall be allowed to use the overhead trolley system in Torbay Road, has visited Torquay and inspected the route. In view of the fact that the Board of Trade's licence for the Dolter system expires on October 31st, the arbitrator's decision may be expected very shortly.

Truro: *Electric Lighting.*—Messrs. J. & W. Purves have received the Council's permission to apply for an Electric Lighting Provisional Order.

Turkey: *Electric Lighting.*—A concession for the electric lighting of Constantinople has been signed by the Minister of Public Works, and representatives of a group of Hungarian and French financiers. The concession is for 50 years. We understand that Messrs. Ganz & Co. will have the contract for the plant.

Watford: *Street Lighting.*—In granting a loan recently for street lighting, the Local Government Board made the following comment: "The Board have sanctioned the borrowing of the sum required for public lighting with some hesitation. The Council should continue to give the question as to the advisability of lighting the streets with electricity their careful consideration, as the Board would have considerable difficulty in sanctioning further loans for the purpose unless the position is materially improved."

Woking: *Electricity Showrooms.*—The Woking Electric Supply Co. have opened showrooms in the centre of the town, where a permanent exhibition of electric lighting, cooking, and heating apparatus will be maintained. On the occasion of the opening a demonstration was given in the use of the "Tricity" cooker.

Yeovil: *Electric Lighting.*—Messrs. J. & W. Purves propose to apply for an Electric Lighting Provisional Order, but the Council have replied that they have no intention of adopting electricity.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Austria-Hungary.—The Vienna-Neustadt Municipality contemplate the erection of a generating station at an expenditure of £23,600.

Bedford.—Mains are to be extended at an estimated cost of £200.

Dartford.—Electrical extensions to the value of £10,000 are to be carried out.

Dundee.—The Engineer has been instructed to report upon the installation of mechanical stokers.

Honduras.—It is stated that a twenty-year concession has been granted to the Puerto Courtez & Baracoa Electric Co. for the supply of electricity for all purposes, and for the construction of telegraph and telephone lines.

India.—The Secretary of State for India invites tenders for the supply of generating sets. Particulars from the India Office, Whitehall, London, and tenders by October 4th.

London: *Stoke Newington.*—A loan of £1,000 for mains is to be taken up.

Norwich.—An application is to be made for a loan of £18,790 (instead of £17,783, authorised by the Council in March), for mains and other plant.

Oldham.—At the last meeting of the Electricity Committee, Mr. S. W. Newington, the Electrical Engineer, foreshadowed that extensions to the generating plant, &c., will be necessary early next year.

South Africa.—According to the *British and South African Export Gazette*, three schemes are under consideration for the electric lighting of Klerksdorp. The estimated cost is £9,500.

It is proposed to form a company with a capital of £926,000 for undertaking the supply of electricity in Tweefontien.

A Government inquiry is being held into a proposal to introduce a supply of electricity into Potchefstroom.

Walsall.—A loan of £23,225 is to be taken up for electrical extensions.

Wigan.—The Local Government Board have sanctioned a loan of £30,083 for electrical extensions.

Digitized by Google

MISCELLANEOUS

Argentine.—A concession has been granted to Messrs. Paquet y Cia. for constructing and working an electrically operated transporter bridge across the Riachuelo River.

Australia.—Tenders are invited by the Deputy-Postmaster-General at Melbourne by October 25th for the supply of electric lighting material (Schedule No. 311). Copies of specifications, &c., may be had from 72 Victoria Street, London.

Belfast.—A large scheme of tramway extensions was adopted at the last meeting of the Corporation.

Burma.—A concession has been granted to the Arracan Flotilla Co., Ltd., of London, for the construction of 17 miles of tramways in the Akyab district.

French Congo.—Tenders are invited by October 14th for the supply and laying of submarine cable between Libreville and Loango. Particulars from the Bureau de l'Ingénieur Chef des Etudes, Ministère des Colonies, rue Oudinot No. 27, Paris.

London: *Hackney.*—A supply of 90,000 pairs of white open-type arc lamp carbons is required. Particulars from the Town Clerk, and tenders by October 13th. The Electricity Committee recommend the purchase of a CO_2 recorder at an estimated cost of £55.

Mersey Railway Co.—Tenders are invited for the annual supply of stores, including incandescent lamps, fittings, and electrical sundries. Particulars from General Manager, Birkenhead.

Norway.—The Norwegian State Railways require two 35 ton electric cranes. Copies of specifications, &c., may be seen at 73 Basinghall Street, London.

Spain.—The August report of the British Chamber of Commerce in Spain states that there is an opening in Madrid for electrically-driven pumps. A large portion of the city is built on hills as high as the water reservoir, and there is at present not sufficient pressure in the mains to raise the water above the first floors.

Whitechurch.—A special meeting to consider the question of electric lighting is to be held on October 4th.

York.—Tenders are invited for the supply of arc lamp carbons, carbon brushes, electric light accessories, meters, time switches, motors, and starting rheostats. Particulars from the City Electrical Engineer, and tenders by October 7th.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Twenty-two houses, Norton Gardens; 40 houses, Newlands Road; 30 houses, Northborough Road; 20 houses, Tylecroft Road; electric theatre, 3 Brighton Road; electric theatre, Beulah Road; and 37 houses, Linden Avenue, Croydon.

Tenders are invited by the London County Council for the wiring of the Coroner's Court, Poplar, and the Hoxton House Schools, Shoreditch. Particulars from the Chief Engineer, and tenders by October 5th.

A site has been acquired for the proposed King Edward Jewish Memorial Hospital, London Jewish Hospital Association.

Swimming baths at East Ham.

Observation ward at Isolation Hospital, Hendon.

Enlargement and improvement of Marlborough Street Police Court.

Secondary school for girls at Romford.

Schools in Southbury Road, Enfield.

Two-story addition, 138-140 Lauriston Road, South Hackney.

PROVINCES.

Aberdeen.—Car shed extensions. Tramway Manager.

Accrington.—Electric theatre in Edgar Street.

Airdrie.—New Town Hall.

Bacup.—Additions to skating rink.

Blackburn.—Police station, sessions house, &c., at Blakey-moor.

Bradford.—Church at Lidget Green.

Burton-on-Trent.—Theatre and hippodrome at Swadlincote.

Camborne.—Construction of St. George's Hall. H. Barrow.

Coventry.—Three branch libraries.

Doncaster.—One hundred and forty houses and business premises.

Douglas (I. of M.).—Mission hall and Sunday school at St. Matthew's. Vicar, 2 Mount Havelock.

Glasgow.—Tenders are invited for the wiring for lighting and power of the various sections of the Scottish Exhibition. Particulars from Mr. A. C. Freeman, 499 Sauchiehall Street. —Workshops at Anderson's Close, Victoria Street. Architect, Mr. A. Robson, 60 Marchmont Road.

Gravesend.—Alteration to Milton Road school.

Greenock.—Two blocks of residential flats in Eldon Street.

Harrogate.—Bilton Council school and the new infants' school are to be wired.

Haslingden.—Workhouse and infirmary. Loan of £1,160 has been sanctioned.

Hereford.—Conversion of Corn Exchange to theatre and public hall.

Llanelly.—Theatre in Market Street.

Larne.—Completion of technical school, Victoria Street. Architects, Messrs. Hobart & Heron, 120 Scottish Provident Buildings, Donegal Square West, Belfast.

Leeds.—Divisional Police Station, Milgarth Street.

Liverpool.—Drill Hall. West Lancashire Territorial Association.—Church and schools, Crosby Road.

Manchester.—Art Gallery and Reference Library on Royal Infirmary site. The Libraries Committee invite tenders for electric wiring.

Middlesbrough.—Drapery establishment on site of King's Head Hotel.

Newcastle.—New Town Hall.

Northampton.—Congregational Church, Abingdon Avenue. Rev. C. S. Larkman.

Norwich.—Fish Market.

Paisley.—Alterations and additions to Working Men's Club, Cawthorne Court.—Alterations and additions to Mission Hall, 14 New Sneddon Street.

Perth.—Police Station at Bridge of Earn.

Pontypridd.—School at Millfields.

Portsmouth.—Nurses' Home at Hospital.

Pudsey.—Warping and beaming sheds at Brick Mills. Messrs. Jowett, Kendall & Sons.

Reading.—Alterations to Workhouse.

Southport.—Proposed school on Scarisbrook Estate.

Swansea.—Seven shops, Alexandra Road. Mr. Hy. Billings.—Six houses, Monterey Street, Manselton. Mr. Jas. Taylor.—Six houses, Chaddesley Terrace. Messrs. Marles, Jones & Thomas.—Three houses, Chaddesley Terrace, Messrs. Richards, Powell & Thomas.—Bank, Wind Street. The London & Provincial Bank, Ltd.—Motor garage and workshops, Oxford Street. The West Wales Motor Car & Engineering Co.—Eight houses, Neath Road, Hafod. Mr. H. Smith.—Five houses, Pentrechwyth Road. Mr. Thomas Howells.—New streets, Manselton. The Manselton Estate.—Six houses, Jersey Terrace, Danygraig. Mr. L. H. Brown.—Casual wards at Workhouse.

Wallasey.—New Town Hall.

Wrexham.—Church in Poyser Street.

Lectures on Electrical Engineering.—A course of twenty-four lectures on the design of D.C. and A.C. machines will be delivered by Mr. H. M. Hobart at University College, Gower Street, London, on Mondays at five p.m., beginning October 10th. The lectures will be followed by one hour's drawing office work, and are open to third-year students and also to engineers and others not studying at the college on payment of a small fee. The syllabus includes the design of rotary-converters, variable-speed motors, turbo-generators, single-phase motors and transformers. Mr. Hobart is also lecturing on "Electric Railway Engineering" to the third-year students at Faraday House, Southampton Row, London, where Mr. J. Rennie, of the Board of Trade Laboratory, is also lecturing on "Electrical Measuring Instruments."

Further Amalgamations of Continental Firms.—Following close on the news of the acquisition of the Lahmeyer Frankfort Works by the Allgemeine Elektricitäts-Gesellschaft of Berlin comes the announcement that the A.-G. Brown, Boveri & Cie., of Baden, Switzerland, have practically absorbed the Elektricitäts-Gesellschaft Alioth, of Basle, and the Isaria-Zählerwerke A.-G., of Munich. The A.-G. Brown, Boveri & Cie. will increase its capital to 28 million francs (£1,120,000) by a further issue of shares to the value of 8 million francs, and 4¾ million francs will be received by the shareholders of the Alioth Co. in exchange for the Alioth shares. The share capital of the Alioth Co. is 6 million francs. Further shares to the amount of 1½ million francs will be exchanged for shares of the same amount of the Isaria Co., and the remaining 1¾ million francs will be taken over by a bank. The immediate result of the transaction will be a pooling of interests on the part of the Brown, Boveri and Alioth companies, but a complete amalgamation of the two firms may follow shortly. The agreement with the Isaria Meter Co., however, will result in the combination of that concern with the Brown, Boveri Gesellschaft, of Mannheim. The agreement with the Alioth Co. will also result in a concentration of the financial interests represented by the Brown, Boveri and Alioth companies and the Schweizerische Bankverein, which is interested in both concerns.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

Australia: *Sydney.*—The Corporation have accepted the following tenders: Coal and ash handling plant, Messrs. Babcock & Wilcox, Ltd., £5,887; 15 miles 11,000-volt cable, Messrs. W. T. Henley's Telegraph Works Co., Ltd., £4,495. It is also proposed to purchase a 5,000-volt feeder panel and two 5,000-volt transformer panels of the Frranti type at a cost of £230.

Adelaide.—Messrs. F. A. McCarty & Co., of Melbourne, have been given a contract for considerable extensions of the Adelaide electric tramway system.

Coventry.—The Corporation has placed a repeat order with E. Bennis & Co., Ltd. (Little Hulton, Bolton), for the supply of four sets of "Bennis-Miller-Bennett" patent chain grate stokers for B. & W. boilers at the Electricity Works.

India.—The Globe Electric Co., Ltd. (11 Farringdon Avenue, E.C.), have just received a further order for 24 "Multax" lamps for the Bengal Nagpur Railway, making the third repeat order during the year.

Kettering.—The Council has placed an order with E. Bennis & Co., Ltd. (Little Hulton, Bolton), for three independent coal elevators for feeding the hoppers of "Bennis" stokers on three Lancashire boilers at the Electricity Works.

London: *Hackney.*—The following tenders have been received for extensions of the main switchboard: Walsall Electrical Co. (£249 10s.); Ferranti, Ltd. (£340); Drake & Gorham, Ltd. (£353); British Thomson-Houston Co., Ltd. (£525); Bertram Thomas (£339 10s.); Electric & Ordnance Accessories Co., Ltd. (£305); Kelvin & James White, Ltd. (£900); British Westinghouse Co. (£786); and Johnson & Phillips, Ltd. (£422).

South Africa.—*The British and South African Export Gazette* states that the A.E.G. Electric Co., Ltd., of South Africa, are supplying 88 direct-current electricity meters to the Johannesburg Corporation. The same Corporation have ordered 2,277 A.C. meters from Messrs. Siemens Bros. & Co., Ltd. The A.E.G. Co. of Berlin have the contract for generators at the new Rosherville power station. The Chloride Electrical Storage Co., Ltd., are supplying a battery and Entz booster equipment to the Delagoa Bay Port and Railway Council.

South Africa.—*Commercial Intelligence* states that all the plant required for the Transvaal Hydraulic Power Syndicate's undertaking at Tweefontein is to be supplied by the British Electrical Federation.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith and Son, of 5 Philpot Lane, London, inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £57 15s. to £58 per ton (last week, £57 15s. to £58).

Bankruptcies.—An application will be made at Bankruptcy Buildings, London, on October 18th, for the discharge of F. Shepherd, Electrician, 4 Haslett Road, Kensington, London.

The trustee in the bankruptcy of W. T. Harris, electrical engineer, 460 Commercial Road, Portsmouth, has been released.

The statement of affairs of F. Peacock, Electrician, North Station Road, Colchester, shows liabilities of £228, and assets nil. The main causes of the failure are attributed to heavy doctor's bills and poor trade.

J. D. Morton, Electrical Engineer, Nettleton Road, Mirfield, Yorks, has been adjudicated bankrupt. The first meeting of creditors was held on September 27th at 11 a.m. at Bank Chambers, Corporation Street, Dewsbury, and the public examination will take place on October 4th at 2 p.m. at the County Court House, Dewsbury.

A conditional discharge has been granted A. J. Hollington, Electrical Engineer, 93 St. Martin's Lane, Charing Cross, London.

The last day for receiving proofs in the bankruptcy of Alan McAlpin (McAlpin & Co., electrical engineers, 44 Cank Street, Leicester) is October 4th. The trustee is Mr. L. V. Wykes, 24 Friar Lane, Leicester.

Notice is given of the release of the trustee of H. K. Barham (South of England Electrical Engineering Co., 60 Fratton Road, Portsmouth).

Liquidations.—Creditors of the Telewriter Syndicate, whose assets have been sold to the National Telewriter Co., Ltd., are requested to send particulars of their claims to the liquidator, John Craggs, 3 London Wall Buildings, London, E.C., by November 10th.

A meeting of shareholders of the Easton Lift Co., Ltd., will be held at Express Works, Short Street, Southwark, London, on Monday, October 31st, to hear the liquidator's account of the winding up. This notice does not relate to the present Easton Lift Co., Ltd.

The liquidator of Improved Electric Supplies, Ltd., 7 Great Newport Street, London, has been released.

New Factory.—The Ruberoid Co., Ltd. (81-83 Knightrider Street, E.C.) have recently completed an extensive factory at Brimsdown, Middlesex, for the manufacture of Ruberoid roofing, dampcourse, flooring, sarking felt, insulating papers, and the well-known P. & B. tapes, and insulating varnishes. These last materials have been continually employed in the industry for over a quarter of a century.

Diesel Engines.—On October 1st Messrs. Willans & Robinson, Ltd., of Rugby, will place Diesel engines on the market. During the past five years the firm have acted as manufacturers for the Diesel Engine Co., but under the new arrangements they will now place the engines on the market themselves, and deal direct with customers, both in Great Britain and for export. Messrs. Willans & Robinson, Ltd., will manufacture the engines in standard sizes, ranging from 120 b.h.p. to 600 b.h.p.

"Onewatt" Lamps.—Messrs. Siemens Brothers Dynamo Works, Ltd. (Incandescent Lamp Department, Tyssen Street, Dalston), inform us that they are placing on the market a range of low-priced 50-volt "Onewatt" lamps, with drawn tungsten filaments, for 10 and 16 c.p. in bell-shaped and spherical bulbs. They also list "Onewatt" battery lamps, 1·3 to 16 volts, 100-c.p. lamps, 200 to 250 volts, and 10- and 16-c.p. lamps, 20 to 50 volts. They are prepared to supply quantities of literature regarding these lamps upon receipt of application accompanied by trade card. Other patterns of "Onewatt" lamps are shortly to be placed on the market.

The Abbey Electric Co.—The telegraphic address and telephone number of the Abbey Electric Co. (17 Victoria Street, S.W.) have both been changed. The telegraphic address is now "*Lighthouse, London*," and the telephone number is now *Victoria* 4,027.

Holophane Shades.—Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), inform us that they are in a position to take orders for the new holophane "Stiletto" reflectors. These are on the market in three types, known, respectively, as extensive or distributing, intensive or concentrating, and focussing or very strong concentrating. All these forms are supplied in various sizes at very moderate prices, and stocks are already held of all except the very largest sizes. The reflectors will be supplied with crinkled or plain edges, the crinkled being supplied unless the plain are specially ordered.

The Metropolitan Electric Supply Co.'s New Tariff.—In our issue of September 8th we referred to the Metropolitan Electric Supply Co.'s new tariff. The circular in which this new tariff is offered is badly worded, and the offer which the Co. makes is not precisely the same as we interpreted it. What the Co. is actually offering is to fix an annual charge, and, in addition, to charge the consumer 2d. per unit up to a certain consumption, and 1d. per unit above this consumption, the penny rate to commence when the charge for units at 2d. is equal to the fixed annual charge. Thus, with, say, a fixed annual charge of £10, the consumer consuming 600 units per year would pay £15, or if he used 1,200 units he would pay £20, and after that 1d. each additional unit.

Municipal Wiring Bill.—In addition to the names we have already published, Hounslow have decided to give "moral" support to the Bill and to consider the question of giving financial assistance when the Bill is drafted. At Manchester the question of financial support has been deferred for the present, but in this case also moral support will be given. At Blackburn the matter will be considered further when the Bill is drafted. The report of the Council and General Secretary of the Ironmongers' Federated Association (Incorporated) contains a reference to the Bill, in which it is said that it will be most detrimental to the trade of their members "if the provisions proposed are adopted—namely, to do free wiring, sell, or practically give away lamps and fittings." General instructions have been given to the Secretary to interview the Gas Companies' Protection Association, and to work in harmony with the Electrical Contractors' Association, as was done last year, in order that the Bill may be strenuously opposed.

OSRAM·LAMPS

APPOINTMENTS AND PERSONAL NOTES

Mr. W. Rutherford has been appointed Managing Director of Messrs. Dick, Kerr & Co., Ltd.

Mr. J. E. Kingsbury, formerly General Manager in London of the Western Electric Company, has joined the Board of Directors of Western Electric Company, Ltd.

Mr. T. M. Nelson, Assistant Engineer to the Launceston (Tasmania) Tramways Department, ha been appointed Electrical Engineer to Christchurch (N.Z.) Tramway Trust. Mr. O. Clandsley succeeds him.

The late Mr. George Flett, Managing Director of Messrs. Dick, Kerr & Co., Ltd., and a director of a number of other electrical companies, left estate of the gross value of £111,653, with net personality of £88,755.

The Board of Trade has appointed Dr. Alexander Russell, Principal of the Electrical Training Institution, Faraday House, to be an Electric Inspector to Surbiton.

Messrs. W. V. Waite & Co., Ltd., engineers, contractors, &c., Gordon Chambers, 31 Queen Street, Cardiff, have just been appointed agents for the South Wales district for Messrs. Bruce Peebles & Co., Ltd., Edinburgh.

Mr. J. M. M. Munro has severed his connection with Messrs. Anderson & Munro, and is now devoting himself entirely to consulting work at 103 Douglas Street, Blythswood Square, Glasgow.

As the result of inquiry at Marconi's Wireless Telegraph Co., we are glad to be able to contradict the rumours that Mr. Marconi is seriously ill on board the *Princess Mafalda* and is returning to Italy. A telegram received on Tuesday from the Argentine states that Mr. Marconi is in very good health.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Northwich Electric Supply Co.—Particulars have been filed of £11,000 debentures, created December, 1904. The property charged is the Company's freehold and leasehold property and general assets. The trustees are Messrs. Brunner, Mond & Co.

Folkestone Electricity Supply Co.—Interim dividend of 4 per cent. per annum, less tax, on the ordinary shares for the June half-year.

Electrical Contracts & Maintenance Co.—Particulars have been filed of an issue of £200 debentures issued on August 4th.

Direct Spanish Telegraph Co.—Interim dividend at the rate of 4 per cent. per annum for June half-year.

Dundee, Broughty Ferry & District Tramways Co.—Dividend of 2 per cent. on the ordinary shares for the year to July 31st, carrying forward £296, after placing £600 to renewals and £600 to debenture stock redemption.

Madras Electric Tramways (1904).—Interim dividend of 4½ per cent. per annum, less tax, on the preferred ordinary shares for the June half-year.

United Electric Car Co.—At the annual meeting on Thursday, Mr. George Richardson, the chairman, prophesied that before long there must be a general improvement in the demand for electric tramcars, as many now in use have been running for nearly 10 years.

Anglo-Argentine Tramways Co.—Interim dividend at the rate of 7 per cent. for the June half-year.

Hobart Electric Tramways Co.—Dividend at the rate of 5 per cent. per annum for the year, carrying forward £1,997.

Kalgoorlie Electric Power & Lighting Co.—Six per cent. on the preference shares for half-year to September.

Eastern Extension Telegraph Co.—Interim dividend of 2s. 6d. per share for the June quarter.

Underground Electric Railway Company of London.—At the meeting on Thursday, Sir Edgar Speyer, Bart., who presided, said that although satisfied with the results which the company had achieved so far, the dividends paid on the share capital did not yet represent anything like a fair return. The income had increased by nearly £13,000, but this was due mainly to economies in expenditure and by the introduction of more efficient turbines. Everything pointed to a further increase in the traffic of the tube railways.

Babcock & Wilcox.—Interim dividend of 10 per cent. on ordinary shares.

National Electrical Manufacturers' Association.—The half-yearly general meeting of this Association will be held at the Midland Hotel, Manchester, at 2.30 p.m., on Tuesday, October 11th.

Fire at Johnson & Phillips' Works.—A slight outbreak of fire occurred at the cable works of Johnson & Phillips, Charlton, on Monday evening, and a quantity of jute was destroyed as well as a portion of a shed. Messrs. Johnson & Phillips inform us that the damage is of only very slight importance, however, and will have no effect on any work in hand.

Regulator with front of housing removed to permit cleaning.

The Simplest Control for Sewing Machines,

which are electrically driven—a compact little apparatus, easily adaptable to any make of sewing machine.

ADAMS 'IGRANIC'

Combined Starter & Regulator

It measures only 7½" × 6" × 4", so that it takes up very little space; it is simple to fix and beautifully easy to clean and keep clean. It provides a quick stop, and no friction brake is needed. A dynamic brake is fitted, which, while it controls and stops the motor, does not prevent or interfere with the hand turning of the machine.

Speed is regulated by the pedal adjustment, and is always under perfect control because it is directly proportionate to the pressure on the pedal.

SUMMARY

Our monthly supplement on Electrical Engineering in Mines is included in this issue. It opens with an account of the electrical installation at the Broxbourne Oil Co.'s shale mines, and a special article on electric lighting in mines also appears. A report is given of a recent case in which the Home Office prosecuted a mine manager for contravention of the special rules, and a short article summarises a few of the most important electrical mining patents published in September. Another article describes examples of electric power installations at New Zealand gold mines, and some interesting experiences with an electric pumping plant are described, showing how various difficulties were overcome.

Successful experiments have been carried out on Salisbury Plain with an aeroplane fitted with a very small wireless transmitting apparatus. Signals have been received at a portable station with a Marconi magnetic receiver up to a distance of nearly a mile. Two balanced aerials, comprising wires strung over the frame, are employed. (Page 632.)

Two papers of interest to electrical engineers were read at the meeting of the Iron and Steel Institute last week. In one of these Mr. D. F. Campbell dealt with the possibilities opened up by the electric furnace for steel refining, and in the other Mr. J. J. E. Schuurman described some methods of economical speed variation of large three-phase motors for rolling-mill driving and other purposes. (Page 633.)

Some information is given with regard to a new "Stannos" wiring catalogue and show-cards. (Page 634.)

Some notes are given on the electrical equipment of the Wellman airship designed for an attempt to cross the Atlantic. (Page 635.)

A short article calls attention to a new series of mowing iron instruments with particularly open scales. (Page 635.)

Among the specifications published by the Patent Office on Thursday last was one by A. F. Berry for cooking apparatus, in which the heat is stored up in a metal block of large heat capacity. This block is enclosed in a heat-insulating cover and the heat is conducted away to the cooking utensil when required.—F. Lydall and Siemens Bros. Dynamo Works protect a meter for use in a proposed new system of charging, in which energy is charged for at a fixed rate per unit multiplied by a factor depending on the irregularity of the demand. The meter automatically measures this factor and indicates the total sum to be charged.—A method of regulating the pressure of A.C. circuits by two oppositely connected transformers is covered by the British Thomson-Houston Co.—A. H. Shaw describes a ceiling rose with a detachable plug for facilitating the removal of pendants. (Page 636.)

Particulars of the Osram lamp advertising arrangements for this autumn are published for the benefit of wiring contractors and agents. (Page 637.)

Digitized by Google

Metal filament lamps are displacing gas for street lighting at Bath.—The profit from the Cardiff tramways last year was £11,000.—A dispute has arisen between the Finchley Council and the Postmaster-General regarding overhead telephone wires.—A horse was killed on the Dolter system at Hastings last week.—Arrangements are in hand for installing trolley omnibuses at Leeds.—Stepney Council refuse to sanction any further trolley lines in their district.—Discussions concerning trolley omnibuses have taken place at Watford, Rotherham, and Newport.—In spite of considerable opposition the tramway profits at West Ham have been transferred to relief of rates. (Page 638.)

Extensions are contemplated at Bexhill (£4,500); Stepney (£7,150); Walsall (£23,225); St. Helens (£10,206); and Hornsey (£6,000). Extensions are also contemplated at Oldham and York. West Hartlepool Council are considering the utilisation of waste heat from local furnaces for generating electricity. (Page 639.)

At the annual general meeting of the British Thomson-Houston Co., and of Dick, Kerr & Co., complaints were made of the low prices obtainable during the past year. A loss of £8,000 is shown by Messrs. Willans & Robinson for the June half-year. (Page 640.)

ARRANGEMENTS FOR THE WEEK

FRIDAY, OCTOBER 7th.

Association of Mining Electrical Engineers.

Annual meeting at Newcastle-on-Tyne.

SATURDAY, OCTOBER 8th.

Birmingham and District Electric Club.

7.30 p.m. Smoking concert at Colonnade Hotel, New Street.

Association of Mining Electrical Engineers.

Annual meeting at Newcastle-on-Tyne.

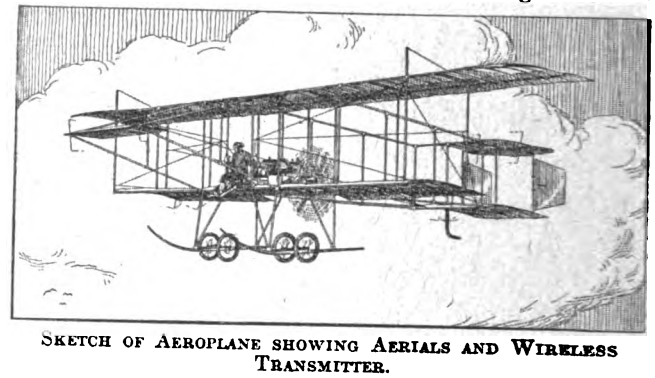
FRIDAY, OCTOBER 14th.

Institution of Electrical Engineers: Manchester Local Section.

7.30 p.m. Conversazione at Whitworth Institute, Whitworth Park.

Wireless Telegraph Notes.—The Marconi Wireless Telegraph Co. state that a message from Mr. Marconi, despatched just prior to his departure to Buenos Aires on Saturday, notifies that transmission has been effected direct between Europe and South America over a distance of some 6,000 miles. Mr. Marconi has received messages at Buenos Aires from Clifden and Glace Bay. The construction of a high-power Marconi station at Punta del Este, Uruguay, is to be proceeded with at once.

Experiments have been carried out on the Doncaster Race Common to ascertain the extreme range of the portable field stations supplied by the Marconi Co. The commercial range of these installations is put at 100 miles, but the experiments prove the possibility of transmitting over a distance of 180 miles with this apparatus. Masts 70 ft. high were used, and the experiments have proved of great value in demonstrating the increasing value of these portable installations for military purposes.



The steamers of the South-Eastern & Chatham Railway Co., on the Dover-Calais as well as on the Folkestone-Boulogne routes have now been equipped with wireless telegraph installations.

According to the report of the Royal Commission on Trade Relations between Canada and the West Indies, the National Electric Signalling Co. (Fessenden system) proposes to install a system of wireless telegraphy between Great Britain, Canada, and the West Indies. It is suggested that the rate will ultimately be reduced to ½d. per word, the company basing this upon the fact that a speed of 250 words per minute has been reached.

Law and Engineering.—The Council of the Society of Engineers (Incorporated), in conjunction with the Council of the Junior Institution of Engineers, have arranged for a course of six lectures on "The Law relating to Engineering," to be delivered by Mr. L. W. J. Costello, at Caxton Hall, Westminster, at 7.30 p.m., on October 10th and 25th, November 9th and 21st, and December 7th and 19th. Fee for the course: Members, 6s.; non-members, 12s. At the close of each lecture opportunity will be given for discussion. Applications for tickets should be made to the Secretary of the Society of Engineers at 17 Victoria Street, Westminster; or to the Secretary of the Junior Institution of Engineers, 39 Victoria Street, Westminster.

WIRELESS TELEGRAPHY AND AEROPLANES

Interesting experiments are being carried out on the Government flying-ground at Lark Hill, Salisbury Plain, by Mr. T. Thorne Baker, the photo-telegraphic expert of the *Daily Mirror*, and Mr. R. Loraine, the aviator. The large Farman-type biplane used by Capt. Dickson during the manœuvres has been put at the disposal of the *Daily Mirror* by the makers, the British and Colonial Aeroplane Co., of Bristol, and this has been fitted up with a wireless transmitter and an aerial especially designed for the purpose by Mr. Thorne Baker. The transmitter comprises a battery, a ¾ in. spark coil (which works with a ⅛ in. fat spark), a Leyden jar, and an inductance, the whole being compactly fitted into a wooden box, and weighing between 14 and 15 lbs. complete. The box measures 12 by 10 by 5 ins., and could be placed under the aviator's seat, but during the present experiments it has been strapped to the passenger seat (which is behind that of the aviator in the Farman machines), as shown in our sketch, prepared from a *Daily Mirror* photograph. The aerial has been drawn in distinctly, and the stay wires left out in order that the arrangement of the former may be clear. As no earth is available, the old arrangement of two balanced aerials, used by Hertz, must be employed. In the present case each aerial consists of three No. 16 phosphor-bronze wires, radiating out some

Sketch of Aeroplane showing Aerials and Wireless Transmitter.

30 ft. from one of the stay-rods at the side of the aviator's seat to the outer stay-rods at the tip of the wing, and then drawn behind and joined together to an insulated support at the tail. The wires are insulated from the stay-rods, to which they are attached by cat-gut. It has been suggested to use a long drooping wire as one aerial and the frame of the machine as the other, but this Mr. Thorne Baker considers would be most dangerous, as the wire could easily come into collision with the propeller in the event of a sudden drop or turn. For these preliminary experiments, the transmitting key has been a small push-button attached to the left side of the aviator's seat. A portable receiver, comprising a Marconi magnetic detector weighing only a few pounds, complete with head-piece telephone and aerial wires has been used. The wires were supported horizontally a few feet above the ground in the form of a star of about 16 yards radius.

The first experiments were carried out on Monday of last week in an exceptionally high wind, but signals were successfully received from Mr. Loraine at a distance of a quarter of a mile. On Friday further experiments were carried out, and communication was established up to a distance of nearly a mile. Mr. Barron, of Marconi's Wireless Telegraph Co., who was present, expressed the opinion that with the latest pattern of receiving apparatus, communication to a distance of 20, or even 50, miles could be effected with Mr. Thorne Baker's small transmitting apparatus. Trials will shortly be made with such apparatus, and experiments on exploding mines by wireless from the aeroplane will also be conducted. Receiving apparatus will also be tried on the aeroplane, and Mr. Loraine has stated that he thinks it will be possible for a passenger so to concentrate his attention as to hear the signals, in spite of the noise of the engine.

The Qualifications of Engineers.—In the course of a lecture before the Society of Engineers on "Current Professional Topics," Mr. H. C. Adams enlarged upon the importance of practical experience as well as theoretical training, and suggested the establishment of a central bureau where a register of the career of every engineer should be kept open to public inspection. Instead of applying for appointments as at present, a candidate would ask for a certified copy of his page in the register to be forwarded to a prospective employer. In the same way, before engaging an engineer, an employer would obtain a copy of his record.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "The Editor, Electrical Engineering, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

THE BROXBURN OIL COMPANY'S ELECTRICAL INSTALLATION

THE members of the Institution of Mining Engineers in Scotland paid a visit of inspection to the works and mines of the Broxburn Oil Company on Saturday, September 10th. Among the points of interest were the new mine of the Dunnet shale seam, and the electrical installation in connection with this mine. The works were described in Papers contributed by Mr. William Love, managing director, and Mr. Clark, the former describing generally the operations at the oil works, whilst the latter outlined the points of interest to mining and electrical men.

The generating plant at present is composed of one 575 h.p. Belliss & Morcom engine, working at 90 lbs. steam pressure, with 1 lb. back pressure for forcing the steam into the retorts for the production of ammonia water. This engine is direct coupled to a Siemens three-phase alternator, which gives 470 kilo-volt amperes at a pressure of 525 volts and 50 cycles when running at 300 r.p.m. The exciter has a capacity of 245 amperes at 110 volts. As this output is more than sufficient for the excitation of the alternator, the surplus is used for lighting the works during the day. Steam is supplied by two Stirling boilers and a battery of Lancashire boilers, all equipped with mechanical stokers. The steam from the boilers passes first through the engines and then to the retorts, thus saving fuel. The power station has been built to accommodate two further 575 h.p. generating sets.

The alternating current is taken to a remotely controlled switchboard, consisting at present of one generator panel, one 200 h.p. feeder panel for Dunnet mine pump (underground), one 200 h.p. feeder panel for Dunnet mine haulage, and one 200 h.p. breaker panel. All these panels are fitted with oil switches, the three feeder panels having maximum cut-outs, with time limit relays, ammeters, kilowatt meters, and integrating wattmeters.

The mine is lighted throughout by 25 c.p. incandescent lamps, spaced 120 feet apart. The main lighting of the works and mine is supplied by a 75 h.p. Belliss-Siemens direct-current set, giving 455 amperes at 110 volts when running at 525 r.p.m.

The underground panel in the Dunnet mine supplies current to one 185 h.p. Siemens-Sulzer pump, one 50 h.p. motor generator for electric drills, one 150 h.p. double drum haulage, one 25 h.p. dook pump, and one 7 h.p. hutch creeper.

The 185 h.p. Siemens-Sulzer pump is capable of delivering 400 gallons of water per minute when running at 1,470 r.p.m. against a head of 820 manometric feet. The motor generator is being used for transforming the current from 525 volts alternating current to 100 volts direct current, for working the electric drills. A small 25 h.p. Siemens-Sulzer dook pump is employed for sinking purposes, and is capable of delivering 150 gallons of water per minute against a head of 210 feet. The 7 h.p. hutch creeper motor is used for raising the empty hutches from the Downcast Mine, and causing them to run back to the top of the electric dook. The Dunnet mine haulage is driven by belts from two 110 h.p. motors, controlled by oil switches, each with a maximum cut-out, time relay, and no-volt release. This no-volt release is of a rather novel type, being so arranged as to stop the motors in case of a runaway hutch, and by push buttons situated at various points in the mine.

The breaker panel supplies one 110 h.p. motor for driving the shale breakers, one 50 h.p. endless rope haulage motor for hauling the broken shale on to the retorts, one 25 h.p. endless rope haulage for filling a 2,000 ton bunker with broken shale, and one 25 h.p. motor for hauling shale from the Stewartfield Mine to the breakers, and from the Dunnet Mine main haulage to the breaker.

All the motors on this work are of the slip-ring type, with liquid starters, excepting the motors driving the high speed turbine pumps, which are squirrel-cage wound, with star delta starting arrangement. All the electrical apparatus at the works and in the mine are earthed on to the armour of the main cables, and these are connected throughout to a common earth bar in the station.

ELECTRICAL MINING PATENTS OF SEPTEMBER

AMONG the patent specifications of electrical mining apparatus published during the past month was one by F. J. and W. A. Turquand, of London (No. 18,756 of 1909), for a miner's safety lamp, comprising a battery or accumulator enclosed in a cylindrical case with a gas-tight cover plate. The lamp is mounted inside a thick glass bell, the open end of which makes a gas-tight joint with the top of the cover plate, and the bell is held in position by a metal cage attached to the cover plate. Contacts are arranged on the top of the cover plate, and these engage with contact springs on the under side of a disc to which the lamp is attached. The lamp is switched off and on by rotating the glass bell, which carries with it the lamp mounting and the contacts.

F. Eckersley and W. Creswick, of Wakefield, describe in specification No. 22,432 of 1909 a new arrangement of the mechanism of an electrically driven coal-cutter with a swivel jib and an endless chain with cutters attached at intervals, driven by means of a sprocket wheel on a vertical shaft. The axis of this shaft usually coincides with the axis of the jib swivel, and the chain passes round a wheel at the opposite end of the jib. According to this invention, the axis of the vertical shaft and swivel is placed to one side of the axis of the armature shaft, and the second motion shaft, parallel and geared to the armature shaft, is placed to the side of the latter.

A supporting frame for coal-cutters of the Hurd bar type is described in specification No. 4,491 of 1910 by F. W. Hurd, of Bothwell, Lanark. In this machine the motor and gearing are contained in a vertical cylindrical casing from which the horizontal rotary cutter-bar projects radially. The frame described comprises a ring provided with an annular internal channel, in which runs a toothed flange fixed to the periphery of the machine, which is rotated in a horizontal plane by means of a handle and suitable gearing. The ring is fixed at one side to a horizontal rail rigidly supported by screw or hydraulic jacks. An adjustable skid or leg supports the ring at the opposite side. The machine can be moved along the rail by means of a rotary handle.

Fire at a Welsh Colliery.—A serious fire occurred on September 8th at the No. 2 Colliery, Llandradack. According to the *Daily Telegraph*, the electrical plant, the winding-engine, and two compressed-air engines were destroyed, the total damage being estimated at between £20,000 and £30,000. The fire originated, it is said, through a spark flung from the brake of the winding-engine and setting the woodwork on fire. Some 1,000 men were in the pit at the time, but all were brought out safely through the No. 1 pit.

HOME OFFICE PROSECUTION

As the result of a fatal accident to a pump attendant last March in the Blackridge Colliery of the United Collieries, Ltd., a charge was brought against the manager, Mr. John Leckie, at the instance of the Home Office, of having failed to comply with Rule 11 of the Special Rules for electricity in mines adopted under the Coal Mines Regulation Act. This rule requires that a competent person shall be in charge of electrical apparatus and machinery in use in a pit. The case was brought before Sheriff MacLeod, at Linlithgow, in July, and a considerable amount of evidence was heard and much discussion took place between counsel for the opposing parties as to the definition of a competent person.

It appears that the man was killed by coming into contact with a faulty joint in a cable on a three-phase 500-volt system. The "oversman," who was in charge of the electrical installation had had only nine months' electrical training as an assistant to a pit electrician, and it was held for the prosecution that this was insufficient. The possibility of the supervision of the manager or under-manager being sufficient to satisfy the Rule was also brought up. Judgment was given on August 30th, the Sheriff holding the charge not proven, but application has been made on behalf of the Home Office for a stated case, with a view of taking an appeal to the High Court.

The following remarks in the Sheriff's written judgment are of interest. His Lordship states that it was known that the question of competence was the point at issue, and it was expected that the Court would be provided with full information as to what provision this particular manager had made for the discharge of this duty of electrical supervision; and also with the views of numerous experts as to their sufficiency in order that there might be obtained from the High Court an authoritative exposition of the term "competent person." The prosecutor, however, had very little information as to what had been done, and the defendants offered no further information, so the Court had not sufficient knowledge to form an opinion as to the sufficiency or insufficiency of the supervision. His Lordship considers that the prosecutor's case was weak, but that it was most difficult for him to obtain the necessary information, and suggests that the Home Office should make a rule that every manager shall set down in writing, in a book open to the inspection of the Home Officials, the exact provision made for the electrical supervision of each shift.

Electric Working in Indian Collieries.—The report by Mr. J. R. R. Wilson, Chief Inspector of Mines in India for 1909 states that the use of electricity is making some headway in Bengal mines. At 13 groups of mines there are installations of 10 h.p. up to 400 h.p. capacity, the power being used for hauling, pumping, screening and lighting.

The Association of Mining Electrical Engineers: Scottish Branches.—At the special meeting held on Glasgow on Sept. 17th for the purpose of forming Scottish branches of the Association, Mr. H. W. Clothier (Newcastle-on-Tyne) presided, and explained to the meeting the objects of the association. The total membership in Great Britain was, he said, about 700 at present. Mr. Glynn Williams (Whitehaven), who was also present, stated that there were already 41 members in the Western Division of Scotland and 25 in the Eastern Division. A branch for Glasgow and the West of Scotland was then formed; Mr. A. Anderson, of Motherwell, was appointed President; Mr. M. Brown, Castlecary, Vice-President; Mr. D. Martin (12 Waterloo Street, Glasgow), Hon. Secretary; and Mr. D. L. Frew (45 Hope Street, Glasgow), Hon. Treasurer. Twelve local council members were also appointed.

Temporary Pumping Plant.—An interesting example of the readiness with which electrical pumping plant can be installed is described in the *Colliery Guardian*. A serious fire occurred recently at the Stony Pit of the Consett Iron Co., Ltd., caused by the ignition of some waste used in connection with an oil engine driving a pump. After the fire was extinguished there was danger of the workings being flooded out unless within a week or so a new pump equipment was in commission. The Cleveland & Durham County Electric Power Co. came to the rescue by running a cable from their main transmission system, about half a mile away, to the pit head, where a step-down transformer was installed, from which about 350 yards of 440-volt cable was run inbye to a 60 horse-power motor, which, together with the necessary pump, had been hurriedly installed. This piece of work was completed in ample time to allow of pumping operations being resumed before the water had encroached to a dangerous extent. This instance affords an excellent example of the advantage of the existence of a network of mains throughout the colliery districts of the county of Durham, and emphasises one of the risks run by owners of private plants, which is absent where a supply is taken from a public source.

ELECTRIC LIGHTING IN MINES

By "Durham"

It will probably be agreed universally that for underground purposes the ordinary incandescent lamp is the most suitable illuminant, and that the requirements of surface lighting, colliery yards, coal sidings, &c., are best met by ordinary or flame arc lamps. Underground wiring can be carried out either in wood casing or in steel conduit. The former is only admissible if the wood be thoroughly dry and well impregnated with a waterproofing composition, and the capping substantially fixed by screws. There are, however, so many situations where casing does not offer anything like sufficient protection to the wires, that it is better to make a universal rule of adopting steel tubing throughout. This also removes the temptation to omit to replace the capping after carrying out repairs. The suspension of unprotected insulated wires from porcelain insulators, although possibly cheap, is, in the writer's opinion, too slovenly to be allowed in mining work. Another point which the writer would insist on is the total prohibition of "temporary" wiring in mines. It is a common occurrence for rough wiring intended only for a few days' service to remain in use for extended periods, with disastrous results.

All tubing should be of the screwed pattern, and where there is any possibility of the wiring being exposed to water, the joints should be carefully made with red lead or some similar substance. A draw in wire must always be used. Switches, &c., should be fixed on iron back plates bonded to the tubing, which in its turn should be connected to the earthed armouring of the power cables or to an independent set of earth rods let into the ground. Strong iron lamp fittings should be used. Many of the watertight patterns on the market will be found quite satisfactory. Care should be taken to have all the lamps protected by gas-tight outer globes, and these should be further provided with substantial metal guards screwed on to the fittings, so as to be efficiently earthed, and not merely clamped by small brass screws.

Where lamps are installed in engine rooms, pump rooms, &c., in-bye, the fuses should be enclosed in strong ironclad gas-proof fuse boxes. At the colliery where the writer is employed there are at the present time four haulage engine houses in-bye, which are illuminated electrically, and there are two more under construction. The lights are taken off a 220-volt circuit, which is supplied by means of a transformer from the 3,000-volt three-phase system. These engine houses are not usually very gaseous, but still they are not free from gas. The writer would recommend that the fuses themselves should be contained in tubes of asbestos or other fireproof material, packed with French chalk or dry sand. If this is done, the arc on blowing will be so effectively smothered that there will be no danger of explosion from this cause in gaseous pits.

Another matter to which attention should be directed is the construction of hand lamps. Risk of shock from these can be avoided by constructing them as completely as possible of non-metallic material, with a suitable lamp guard, and the use of more substantial plugs, sockets, and connections. Several of the new hand lamps on the market are eminently suitable. "Looping in" wiring should be adopted whenever possible, and except for surface work, distribution boards can largely be avoided.

Association of Mining Electrical Engineers: Annual Meeting.—The annual meeting of the association will be held on Oct. 7th and 8th, at Newcastle-on-Tyne. Special return tickets to Newcastle at the reduced rate of single fare and a quarter will be issued by the Associated Railway Companies on production of a certificate to be obtained by members from the general Secretary of the Association, Bank Chambers, London Road, Derby.

Colliery Fatality.—Late in August a collier, J. Jones, was killed at the South Rhondda Colliery by electric shock received from a 400-volt D.-C. system. The deceased and another were engaged in putting up iron girders in a main road, and the former took hold of a coil of old signal wire lying on the side of the roadway for use in supporting the girder temporarily. It appears that the wire comprised several pieces jointed together, and that a sharp end at one of the joints caught in a cable lying along the roadway at a place where a joint had been made. The cable was one of two very light rubber-covered 3/20 cables supplying a 5 h.p. pump. The wire pierced the insulation and reached the core, with the result that the man received a fatal shock. At the inquest, the jury returned a verdict of death by electric shock, and advised that the recommendations of Mr. R. Nelson (H.M. Electrical Inspector of Mines) that cables should be protected at points where repairs were being carried out, and that disused wires should not be left about, should be strictly carried out.

ELECTRIC POWER IN NEW ZEALAND GOLD MINES

CONSIDERABLE progress is being made in the application of electric power to gold mining in Australia and New Zealand, and one or two installations of this nature are described in a recent number of the *Australian Mining and Engineering Review*. In the Waihi Mine (New Zealand), for example, the new extensions to the pumping plant now in course of installation preparatory to sinking further are all to be worked electrically. The new generating plant for this purpose consists of two 750-h.p. producers and two 368-h.p. tandem type Crossley gas engines. These will be direct-coupled to Siemens D.-C. generators, the current from which will be transmitted at 550 volts to two electrically-driven 3-throw ram pumps of a capacity of 1,500 gallons per minute. One of these pumps will be placed at the No. 9 or 1,000-ft. level, and deliver to the other at the No. 6 or 535-ft. level. This plant will work either independently of, or together with, the present pumps, and in the event of a temporary stoppage of either, there will be no occasion to abandon the lowest level.

At the neighbouring Waihi Grand Junction Mine there is a fine example of an electric winding plant, designed to hoist 1,000 tons in nineteen hours from a depth of 2,000 ft. The winding motor is D.-C., current being supplied by a synchronous motor generator, which develops enough power for the ordinary load. The excess power at starting is supplied by a fly-wheel generator working at 300 to 600 revolutions, and a motor and generator with 5-ton fly-wheel are provided to absorb excess power up to 100 h.p. This latter is not in use, as the present winding is only from the 1,000-ft. level, and only 200 tons per day are handled. The power station at this mine contains three Parsons turbines of 580 b.h.p. running at 3,000 r.p.m. and Brown-Boveri 550-volt 50-cycle alternators.

Another New Zealand mine where great use is made of electrical power is that of the Ross Goldfields, Ltd., which takes current from a water-power station drawing water from Lake Kanieri, about twelve miles from Hokitika. The water is conveyed about eight miles through tunnels, and flows to the head of the pressure pipes, where a fall of 250 ft. is available. The generating set in the power house are two 350-k.w 2,300-volt 60-cycle alternators by the British Thomson-Houston Co., and they are driven by Pelton wheels. Transformers step the pressure up to 24,000 volts, at which voltage power is taken up a twenty-three mile transmission line to a substation at Ross, where the pressure is reduced to 440 volts for use about the mine. A series constant-current transformer is in use for lighting both of the mine and the borough of Ross. In this substation are also erected two electrically-driven capstan winches for lowering the vertical pumps in the shaft. These winches are arranged to give a very slow motion to the pumps, about 1 to 2 ft. per minute. They are very powerfully built, and capable of lifting 75 tons. Each of them is driven through worm and spur gear reductions by a 6-h.p. Westinghouse motor, and is fitted with very powerful hand brakes. Behind these capstan winches is erected a large main double drum hoisting winch, which is built by Wantage Engineering Co., and is driven by a 75-b.h.p. Westinghouse motor. The controller for regulating speed is similar in outward appearance to the well-known type of tramway controller. Powerful brakes are fitted to each drum. The two pumps to be used in unwatering are the vertical type of Worthington multistage turbine high-lift pumps, direct-connected to British Westinghouse three-phase squirrel cage motors. These pumps are designed to run at a speed of 1,730 r.p.m., and are each of them capable of lifting 750 gal. per minute, to a height of 330 ft. They will be slung in the bight of a steel rope, one end of which is connected to the top of the poppet heads, and the other, after passing around the pump pulley and over the top of the poppet heads, goes to the capstan pump winches. The pumps are lowered in the shaft as is required by the subsiding water, and at the same time additional lengths of delivery piping are placed on the discharge end. The motors driving the pumps are 120 b.h.p. each, and take the current at 440 volts. This current is delivered by a three-core flexible armoured cable, which is wound round a cable drum. One end of this cable is, of course, attached to the pump motors, and the cable is paid out as the pump is lowered. The other end of the cable is connected to the autostarters, which take their current from the main switchboard. These two cable winches are made by the W. T. Henley's Telegraph Works Co., Ltd., England, and are erected in a shed at the top of the shaft, and the cable is raised or lowered as required by hand.

As soon as the mine is unwatered the pump chamber will be built at the bottom of the shaft, in which will be installed the permanent pumping equipment. This consists of two Worthington horizontal type turbine high-lift centrifugal pumps. These pumps will run at a speed of 1,160 r.p.m., and are designed to lift from 1,000 to 1,500 gal. per minute to a height of 400 ft. Each is direct-driven by a 200-h.p. British Thomson-Houston squirrel-case, three-phase induction motor. The controlling switchboard will be erected in this chamber, and a three-phase cable will be laid down the shaft, connecting this board with the substation. As soon as mining operations are started, it is proposed to employ an electric locomotive to do all the haulage between the working faces and the shaft.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during September.

September 1st.—Supplement on Electrical Engineering in Mines, opening with an illustrated article on the three-phase electric winder installed at the Abercwmboi Colliery of the Powell Duffryn Steam Coal Co., which is a fine example of the simplest form of electric winder without load-equalising fly-wheel plant. Some notes on electrical mining patents published during August are included in the supplement. A very complete switchgear catalogue is also reviewed.

September 8th.—Abstract of a report on motor and dynamo breakdowns.

September 15th.—Illustrated article on a tramway line where a double trolley system is used.

September 22nd.—A long article on the control of three-phase motors. Description of a new cooling tower.

September 29th.—Illustrated description of a cable works. Report on a boiler accident due to impure feed water.

Totally Enclosed Motors.—A leaflet from the A.E.G. Electric Co., illustrates two patterns of totally enclosed motors, one with the bearing shield and frame in one solid casting, and the other of normal construction with massive inspection plates. Both the forms are watertight, and are designed for installation in exposed positions.

Association of Mining Electrical Engineers: *Scottish Branches.*—At last Saturday's meeting in Dunfermline, a branch of the Association was formed for the East of Scotland. Mr. Weir, of Bowhill, was appointed secretary, and Mr. G. Andrew, treasurer. The election of a President and Vice-President was left to the Committee.

Iron-clad Switchgear.—An illustrated pamphlet issued by the Allgemeine Elektricitäts-Gesellschaft of Berlin. gives full particulars of a line of iron-clad switches and motor-starters combined with fuses, ammeter and cable boxes for A.C. and D.C. circuits up to 550 volts. A special form for outside portable mining and agricultural machines is described. All these switches have interlocked doors, and those for portable machines have interlocked plugs.

Transport of Coal and Ore by Electric Locomotives.—The July issue of the Transactions of the South African Institute of Electrical Engineers contains a Paper by Mr. W. C. Brown on "Transport of Coal and Ore by Electric Traction," in which a haulage system by locomotives is considered. Continuous-current motors are recommended, and the use of two small locomotives working in tandem is advised in preference to one large one on account of greater ease in rounding sharp curves, smaller spare locomotive necessary and lighter track, &c. Particulars of a system where 3,660 tons of coal and 103,260 tons of ore are hauled per month by 20-ton locomotives up a grade of 1 in 40 are given. With current at ½d. per kw.-hour, the working costs per ton mile worked out at 1·66d., and the maintenance costs at 0·66d. The locomotives consist of 10-ton units each, and each unit is equipped with two 45-h.p. 500-volt series motors fed by an overhead line, which is supplied from a three-phase transmission line through rotary converters.

Electrical Apparatus for Mines.—An illustrated catalogue of electrical apparatus and accessories for mines and collieries has been issued by the Adnil Electric Co., Ltd. (Adnil Building, Artillery Lane, London, E.C.). A 750 kw. exhaust steam turbine set, and several patterns of motors for pumps, &c., are illustrated. Iron-clad switchgear, high-pressure motor switch panels, and various patterns of oil switches are briefly described, and several pages are devoted to signalling apparatus. The system described in ELECTRICAL ENGINEERING, April 17th, 1910, Mining Supplement p. xlix., is included. A number of water-tight telephone instruments, bells, and hooters, loud-speaking telephones, a motor-driven bell, junction boxes, relays, fans, and lighting accessories, are listed. Particulars are also given of a dust-proof plug socket switch, with interlocking arrangements to prevent the plug being inserted or withdrawn while the switch is closed.

SOME PRACTICAL DIFFICULTIES IN AN ELECTRICAL PUMPING PLANT

COMMUNICATED.

ALTHOUGH it is an easy matter to generalise upon the application of electricity to mines, troubles sometimes occur in parts, due to the fact that the operation of electrical plant in mines is associated with practical difficulties which are not experienced with other applications of electrical energy. As a consequence, a considerable amount of distrust appears to have been aroused as to the reliability of certain types of plant for the purpose of mine operation. Notwithstanding the fact that for every case of breakdown of electrical plant in collieries there can be shown hundreds of cases of continuously successful working.

As an example of difficulties due to particular circumstances, and not to defective design or workmanship, may be taken the case of an induction motor driving a turbine pump for unwatering a mine may be cited. This set was of medium capacity, running at high speed, and driven by a totally enclosed vertical shaft three-phase motor from a medium pressure supply. The first difficulty which occurred was found on trying to start up the set for the first time. Although the rotor was perfectly free when the current was switched off, so that the whole pump could be easily turned by hand, it was found that directly current was switched on, the rotor was pulled over against the core. The motor had been tested immediately after construction, but in that case it had been started up by running up on a separately excited generating set. Under working conditions, however, continuous current was not available for separate excitation, as the exciter was directly connected to the shaft of the alternator. Thus the pump only could be started by switching it directly on to the full supply pressure, and the momentary surge of current at starting exerted such a powerful torque that, owing to the small air gap, and, therefore, the liability of an unequal pull on one part of the rotor due to the slightest inequality between the width of one portion of the air gap and the other a side strain was put upon the shaft which it was too flexible to resist and the rotor was pulled over sideways on to the stator.

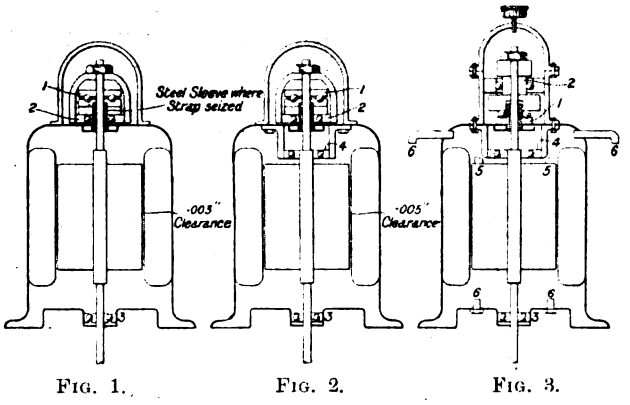

FIG. 1. FIG. 2. FIG. 3.

1. Thrust-Bearing.
2. Top-Registering Bearing.
3. Bottom-Registering Ball Race.
4. Extra Registering Ball Race.
5. Fan Blades
6. Inlet or Outlet Pipes for Ventilation.

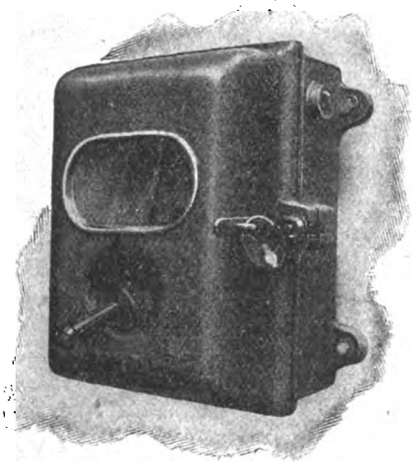
In order to overcome this difficulty, an attempt was first of all made to modify the conditions of starting by introducing an auto-transformer, but although this means would have worked satisfactorily had the power been derived from a power in bulk supply system, it failed in this instance, owing to the fact that there was only a margin of about 5 kw. between the total available output of the generator and the running demand of the pump. It therefore at first appeared as if a larger generating plant would have to be installed to deal with the difficulty, but ultimately the trouble was removed by increasing the air gap between the stator and rotor by two mils.

After the pump had been got into operation, however, further trouble was experienced, owing to irregular governing of the gas engine driving the alternator. The effect of the periodic fluctuations was that the rotor was pulled over towards the core of the stator in the same manner that it had been pulled out of centre by the starting-current. The impulses in this case were, however, not quite so severe, and on account of the increase of the air gap the rotor was unable to touch the stator core. From Fig. 1, however, it may be seen that a steel sleeve was fixed in the top bearing, in which the shaft revolved with very little clearance, so that, when pulled over, the shaft touched on the steel sleeve and seized. This trouble was cured by adding an extra ball bearing as shown at 4, in Fig. 2 (B), fixed to the top of the motor casing, and holding the shaft at a point below the lowest portion of the steel sleeve.

A certain amount of trouble was also experienced on account of the wood bushes of the holes in the case where the stator leads entered becoming soaked with water, but this was cured by impregnating them with tar.

Yet another difficulty was experienced owing to the fact that the motor was liable to get out of step with the generator. The engine was driven by means of a suction gas plant, and if the quality of the gas varied unduly, the engine was liable to misfire. If this happened too frequently, the motor was liable to fall out of step, and as the motor would not of its own accord come up to speed again unless all the resistance in the shunt circuit of the exciting dynamo was taken out, the starting-current, which was considerably in excess of the normal current-carrying capacity of the rotor windings, was liable to remain on the rotor. The running temperature of the rotor was supposed to be not more than 90° F. above the atmosphere; but, owing to the fact that a considerable amount of water was constantly coming down the main shaft, all accessible parts of the motor were so effectually cooled that any rise in the internal temperature of the motor would escape observation until considerable damage had been done. The result of this was that the solder became melted out of the short-circuiting rings of the rotor, and, owing to the resistance of the rotor being considerably increased from this cause, a burn out of the stator ensued. It was therefore decided to re-wind the stator and to braze all the rotor bars into place, and as this occurrence indicated possibility of a highly increased internal temperature in the motor without an adequate external indication of trouble, it was resolved to convert the motor from a totally enclosed system to a partially ventilated arrangement. This was effected by adding ventilating inlets and outlets, as shown at 6, Fig. 3, and a series of fan blades fixed at the top of the rotor to the spider. With this arrangement it was found that the pump operated perfectly satisfactorily, and the whole installation has been running for a lengthy period without further trouble.

In narrating the series of events described above, there is no intention of attributing any fault of design or workmanship in any part of the plant described which could have been foreseen or guarded against before the plant was actually put into commission, and without the light of knowledge acquired by actual experience in the working of the plant. It is, however, intended to show that conditions arise in mining engineering which are not usually present or at any rate so prominent in other branches of electrical applications which have been more thoroughly investigated, and it is therefore evident that the mining electrical engineer, far from being an unskilled attendant only equal to attend to routine duties, must have an experience which will fit him for coping with most unexpected difficulties. The necessary corollary of such a proposition is that the status of the mining electrical engineer should be considerably in advance of what it is at present, and his pay should in many cases be considerably improved in order to secure men who can do justice to the machinery placed under their charge.



Harton Coal Co.'s Collieries.—According to the *Yorkshire Post*, the Harton Coal Co., Ltd., are proceeding with the electrification of their Bent House, Boldon, St. Hilda, and Whitburn Collieries, all of which are near South Shields. The Harton colliery is already completely equipped.

The Fisher Protective System for Mines.—One of the most interesting systems that has been proposed for ensuring safety from risk of electric shock in mines is that devised by Mr. H. J. Fisher, and fully described in ELECTRICAL ENGINEERING IN MINES, February 3rd, page xviii. The equipment for this system is manufactured by Messrs. W. T. Glover & Co., Ltd. (Trafford Park, Manchester), who have just issued a pamphlet containing a technical description. The gate end box contains a three-pole oil switch, with solenoid release operating on no-voltage and overload, and fitted with variable time limit attachment. The principal feature of the system, however, is that the switch is also released when the continuity of the earth circuit is interrupted. An indicating lamp shows if the supply voltage is on or off the box or trailing cable. The special plug, which also provides contacts for the trailing cable, is arranged to trip the switch when it is withdrawn, and is also interlocked so that the switch can only be closed when it is inserted. A special form of trailing cable is provided.

ELECTRICITY IN THE IRON AND STEEL INDUSTRY

AMONG the numerous papers presented at the autumn meeting of the Iron and Steel Institute at Buxton, which was held on Tuesday, Wednesday, and Thursday of last week, were two of special interest to electric engineers, dealing respectively with refining of steel in the electric furnace and with the utilisation of electric power in the iron and steel industry, with special reference to the economical speed regulation of alternating current motors. Abstracts of these papers are given below:—

Electric Steel Refining.

Mr. D. F. Campbell in his paper on this subject said that the efficiency of the electric furnace was acknowledged in America, Germany, and France for the refining of steel from the Bessemer converter in the manufacture of rails, railway material, &c., in connection with the basic open-hearth process for the production of tool steel and intermediate qualities, and to a less extent for melting and refining charges of cold scrap. Single furnaces had been producing 200 tons of steel per day for over 16 months, and already several were under construction and at work in this country.

A wider application for rails and sections might occur in connection with the Talbot furnace, for the charge could be taken to the electric furnace as soon as the carbon was down, and the necessity of removing the sulphur and getting a teeming heat avoided, as this is done in the electric furnace both economically and completely. Similar conditions, he said, occur when working in conjunction with an open-hearth plant for making castings. Even in the case of foundries engaged in ordinary open-hearth casting work, in which the margin of profit is now exceedingly small, the electric furnace is considered necessary for an improvement in quality, while in a small foundry making light and intricate castings from crucible steel, an economy of several pounds per ton may be expected to result from the adoption of the electric furnace, judging from the reduction of the costs in works in Germany, where crucible furnaces were replaced by this process.

There is little doubt, continues the author, that crucible steel, Swedish billets, and products of intermediate quality, such as are used for the Sheffield trade and by tube-makers of Staffordshire and South Wales, can be economically replaced by steel refined by electricity, and made in Middlesbrough, Cumberland, or the larger steelworks in the Sheffield and Rotherham districts.

The use of the electric furnace is not likely to become general for rail-steel manufacture at the present time, except under exceptional conditions.

In the electric furnace, almost any degree of refining can be economically effected, and the removal of sulphur, phosphorus, and oxygen is especially easy. The steel is particularly free from blowholes, and the quality of the steel is better than that of a material of a similar chemical composition made in an oxidising furnace, owing probably to the reducing condition under which it is finished.

In considering the cost of applying the process, the following aspects of the matter must be considered:—The possibility of saving in cost of raw materials, since the best qualities of steel can be made from impure raw materials; the possibility of increasing the output of present furnaces by the addition of electric furnaces, with improvement of product; the possibility of using power derived from waste heat; the possible reduction of capital expenditure at works where the present products are not sufficiently good for modern specifications.

The author, on the whole, favours the Heroult furnace, as embodying more of the desirable features of electric-furnace design than any other, which, in the author's opinion, are:—(1) The best basic open-hearth design should be followed as closely as possible. A bottom homogeneous and solid, and banks free from embedded electrodes, is important. (2) All electric mechanism should be entirely separate from the furnace, and should be of standard design, so as to avoid all unnecessary risks and complications. (3) A high-power factor must be maintained. (4) To avoid excessive cost of refractory materials, the roof should be protected from the direct radiation of the arcs by the electrodes themselves, and the intensely heated area of slag should be as large as possible, to increase the surface of refining action. (5) The temperature of the slag should be maintained above that of the steel, and the conditions in the furnace should be oxidising, neutral, or reducing at will.

From the electrical engineer's point of view, he continued, the electric furnace is an attractive load, as it is more or less in continuous operation. In the case of the Heroult furnace the power factor is 0·88 to 0·90, though less with induction furnaces. Single, two, or three-phase current of any frequency from 20 to 60 has been used without difficulty. The load factor will be most favourable, the usual practice when refining, for example, in a 15-ton furnace, being to use 2,000 kw. for 20 minutes after charging, while the steel is being heated. The current is then reduced to about 1,500 kw. for 45 to 75 minutes, until the steel is ready for teeming. There is then an interval of 10 to 15 minutes, during which the furnace is teemed, fettled, and charged, which allows the transformers or generators time to cool before the period of overload commences. Current fluctuations occur for a few minutes, while there is an evolution of gas from the steel which makes the bath boil up and touch the electrodes. This, however, is not sufficient to be objectionable.

Variable Speed Three-phase Motors.

At the outset of his paper on "Electric Power in the Iron and Steel Industry" Mr. J. J. Elink Schuurman (Baden, Switzerland) remarked upon the economy to be obtained by the utilisation for power purposes of blast-furnace gas in large gas engines, and also said that in steelworks where there were no blast-furnaces in the immediate vicinity steam turbines had nearly entirely been adopted for the generation of energy. Most of the older equipments employed continuous current, but on account of its advantages as regards transmission, alternating current was now more usual. It suffered until recently from the disadvantage that economical motor-speed variation could not be made, but it was the object of the paper to show ways in which this difficulty had now been overcome.

For the driving of rolling-mills it is often necessary to obtain different no-load speeds, depending upon the rolling programme. The sort of mill used will determine whether these speeds should remain constant from no-load to full-load, or whether a drop of speed is required. The latter will be the case for blooming or similar mills, with which

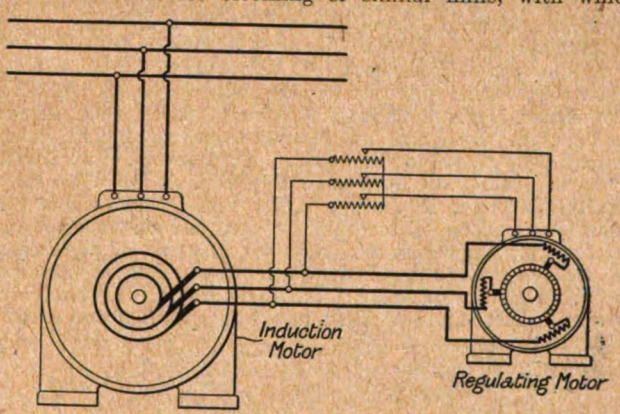

FIG. 1.—THE SCHERBIUS SYSTEM OF SPEED REGULATION.

considerable peak loads are experienced, which must be taken up by the use of rotating masses. For wire mills and the like, where the load remains fairly constant, a drop of speed is not necessary. Speed regulation is also essential for motors driving rotary blowers.

When the speed is constant, the high-speed rotary blower produces a pressure which is practically independent of the volume of air delivered, the volume depending only upon the section of the tuyeres. A change of pressure can be obtained by varying the speed, and as the pressure increases approximately with the square of the velocity, comparatively small alterations in the speed will suffice to produce the pressure-variations necessary for the operation. Besides the principal operations above mentioned, various small drives requiring regulation of speed come into account, such as live roller-beds, cranes, transporting apparatus, hoists, hydraulic pressure-pumps, &c. Most of these drives must also be reversible.

After a few words as to the wasteful nature of speed regulation of induction motors by rotor or slip resistance, and the disadvantage of this method of regulation that for a once-adjusted slip resistance the speed changes to a very great extent with variations of the load, and rises to practically its normal value at no-load, the author proceeded to

Digitized by Google

describe the system of regulation which had been devised by Dr. A. Scherbius.

In this system, instead of the slip-rings being connected to a variable resistance, they are connected to an auxiliary motor (see Fig. 1) of the three-phase commutator type, so that the energy can be utilised. The auxiliary motor is shunt excited, and, possessing little inductance, can be regarded practically as running like a continuous-current machine. Speed regulation of the main motor is obtained

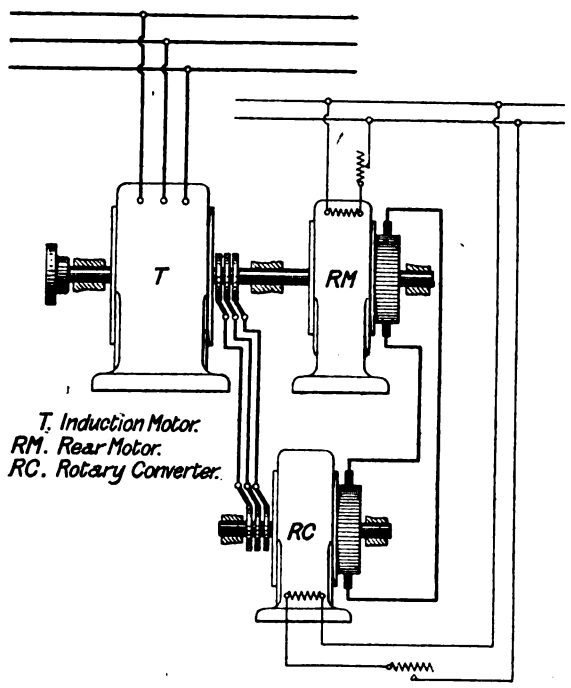

Fig. 2.—The Krämer System of Speed Regulation.

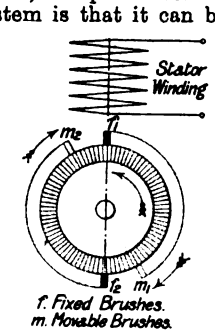
by adjustment of the excitation of the auxiliary motor, and thus controlling the motor voltage. A compound winding on the auxiliary motor can produce a drop of speed of the main motor, so that the energy of a fly-wheel may be drawn upon automatically if required. The auxiliary motor can either be coupled directly to the main motor, so that the slip energy is given back mechanically to the main driving shaft, or it can drive an induction generator and return power electrically to the line. In general, the former arrangement is the more desirable, but it is not always possible, as with it the regulating motor must follow the speed fluctuations of the main motor, and on this account becomes too expensive for very wide ranges of regulation. In such cases the regulating set, which runs at constant speed, is preferable. Another point about the Scherbius system is that it can be used to obtain speeds above as well



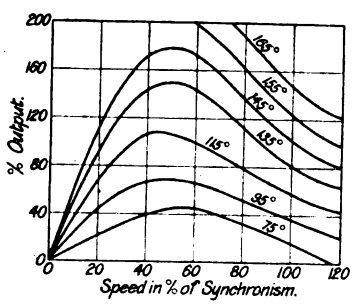


Diagram of Connections.

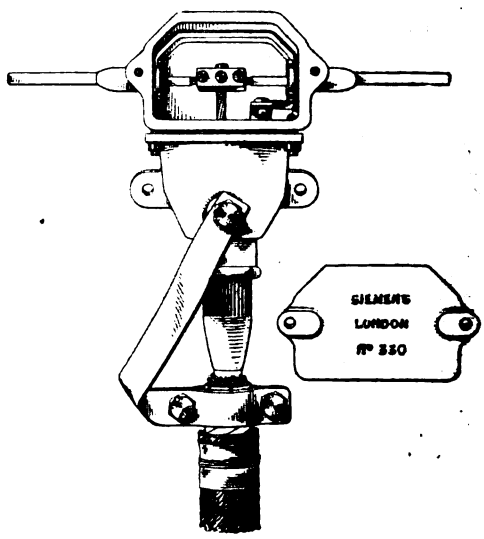
Characteristic Curves.

Fig. 3.—The Déri Variable-speed Single-phase Motor.

as below synchronous speed. It also permits of power-factor compensation.

The system due to Mr. C. Krämer was then described. In this case (see Fig. 2) the slip energy is converted by a rotary converter to continuous current, which is fed to a continuous-current motor assisting the main motor, and the speed is regulated by varying the resistance in the shunt field of the auxiliary motor. When resistance is cut out, the armature voltage, and the continuous-current voltage of the rotary converter, will increase. At the same time the alternate-current voltage at the slip rings must increase, as the continuous-current and alternate-current voltage of a rotary converter stand in a fixed relation to each other. The speed of the main motor will thus decrease. The system is capable of very wide ranges of regulation, but is rather more complicated than the Scherbius system; also it cannot be used so easily with existing motors.

The Déri single-phase repulsion motor offers a third solution to the problem, particularly in the matter of output It is shown diagrammatically in Fig. 3. The speed regulation and reversal is effected entirely by alteration of the position of the movable brushes.



The motor has a series characteristic, or, more exactly, an infinite number of such characteristics, each being for a certain position of the brushes (see Fig. 3). By moving back the brushes over the zero position during running, regenerative control can be obtained.

The great advantage of the Déri motor is its simplicity. When the output is small, the single-phase Déri motor will hardly affect the even distribution of the load on the three phases of the system, especially if there are several such motors which can be divided over the different phases. But when large motor outputs come into question, it is better to make use of a double commutator motor, which electrically consists of two Déri motors, mechanically built into one.

Examples are mentioned in the paper of motors up to 2,000 controlled by the Scherbius system. The Krämer system is also in use in a few rolling-mills. Déri double commutator motors of 250 h.p. are under construction for a corrugated tube mill in Germany. The Déri motor is also suitable for cranes and other auxiliary machinery.

THE "STANNOS" WIRING SYSTEM

MESSRS. SIEMENS BROS. & CO., LTD., Carton House, Westminster, S.W., have sent us a new catalogue of their "Stannos" wiring system, and also a new showcard relating to this. The showcard, which is reproduced on a small scale on the second page of our cover this week, is lithographed in nine colours and measures 20 ins. by 15 ins., and it clearly emphasises the neatness with which the "Stannos" system can be erected. In addition to this, the firm have published a picture post card of this design in three colours, with a communication to the public on the front half which the wiring contractor can sign. Messrs. Siemens Bros. & Co. inform us that both showcards and post cards will be sent free on application to all

House Service Box.

who are willing to exhibit and dispatch them respectively, and if post cards are ordered in quantities of a hundred and upwards, the customers' names and addresses will be overprinted free of charge.

The new catalogue contains a complete description of the "Stannos" and allied systems of house wiring, and is brought completely up to date. "Stannos" wires are now made in five sizes, from 1/18 to 7/20 with ordinary sheathing, and in seven sizes from 1/18 to 7/16 with heavy sheathing. The latter is intended for ship lighting, railway coaches, or other places where a stronger protection is desirable. We illustrate a house service box specially designed for supplying a row of contiguous houses. It takes a low-tension concentric service cable up to ·05 sq. ins., and out-going "Stannos" mains up to 7/16 S.W.G., which can be run along the front of the house and branched off to similar "Stannos" wires by means of special water-tight T-joint boxes.

THE WELLMAN AIRSHIP

SOME notes on the Wellman-Vaniman dirigible balloon *America*, with which an attempt to cross the Atlantic is projected, are given in the *Electrical World* (New York). The airship, which is 228 ft. long and is propelled by two 80 h.p. engines, is provided with an electrical equipment designed by Mr. B. R. Whelan, of the Buckeye Electric Company, and includes a ¼ kw. shunt wound 25 volt generator, arranged so that it can be connected to either of the two propelling engines or to the smaller auxiliary engine which is provided to work the air-pump for filling the ballonet and certain winches. There is also a 12-cell storage battery, a special Marconi wireless telegraph outfit, and eight 25-watt tungsten lamps with holophane steel reflectors are placed at various points. The wireless set is situated in the lifeboat, which is slung under the car-body of the balloon, and contains also the accumulator battery. The installation has a range of 75 miles, and uses about 250 watts, and the sending and receiving apparatus is connected between the steel car-body, which virtually forms the aerial, and the steel trail rope, which will be earthed by dipping in the sea. A very loose coupling is used to minimise the effect of the variations of length of the trail rope. The wireless apparatus will be in charge of Mr. J. R. Irwin, who received the famous C.Q.D. message from the *Republic* when stationed at Siasconset. The fact of the frame of the nacelle being used as part of the wireless aerial necessitated particular care in the insulation of other electrical circuits, and a special stranded cable was used, covered with a fine asbestos shield and immersed in rubber solidified to a coating of ⅛ in. thickness. This was then spun with jute to give tensile strength and the strands woven, encased in fabric, and treated with fireproofing solution. On puncture test this insulation withstood 26,000 volts.

A special bed plate and pulleys are provided in connection with each engine, so that the generator can be attached to any one and driven at the proper speed, and permanent wiring is brought to each position with a multiple switch for the circuits from each engine position. The wireless apparatus and the lights are usually run in parallel from the battery, but either or both can be supplied direct from the generating plant if necessary. All connections between the lifeboat and the nacelle can be broken by withdrawing a single plug in case the boat has to be lowered rapidly.

The lamps are arranged as follows:—One each for the binnacle and the log, one over each of the three engines, two at the observation cabin at the stern, and one in the lifeboat for the wireless operator. The lamps are run above their rated voltage, as their brilliancy is of more importance than their life, considering the anticipated length of the trip.

The cable, where exposed, is carried in porcelain cleats screwed to large wooden blocks which are lashed to the nacelle with insulated cordage. Where it is necessary to run along the framework or through the steel tank covers, the cable is encased first in flexible duct and then in ⅛ in. fibre tubing. The switchboard also is well insulated from the frame of the ship by wood, rubber and heavy fibre between each connection and the steel tubing to which it was lashed.

ANSWERS TO CORRESPONDENTS

Correspondents must in all cases send their names and addresses with their queries, and, if they do not desire the reply to be published after their own name, should add a "nom de plume." Questions should be addressed to The Editor, ELECTRICAL ENGINEERING, *203-6 Temple Chambers, Temple Avenue, London, E.C. The Editor will not guarantee to answer all questions in this column, and the enclosure of a stamped and addressed envelope is therefore desirable. Books recommended will be forwarded on receipt of a remittance for the amount mentioned.*

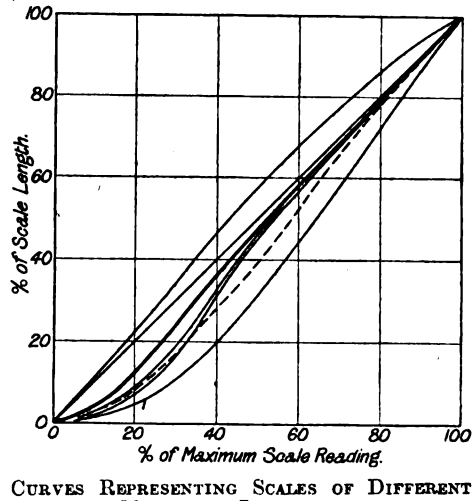
R. J. S.—A letter sent to the Puerto Cortez and Baracoa Electric Company, Puerto Cortez, Honduras, will be sufficiently addressed.

EALING informs us that on replacing his kitchen switch, which had become mechanically defective, the light in adjoining scullery was affected. Before replacing the switch the scullery light flickered when the wires to the kitchen switch were pulled in and out, although the looping-in wire was twisted up tightly, and on replacing the switch he found that the scullery light would not light at all.—In all probability the looping-in wire, which runs from the kitchen switch to the scullery switch, has got broken either at the back of the kitchen switch or else at the scullery switch by having been pulled. We should recommend him to take out the kitchen switch again and examine the wires behind, and then do the same with the scullery switch. If he can discover nothing wrong, he should connect up a new looping-in wire from the kitchen to the scullery temporarily, and if this restores the light in the scullery, as it probably will, it will show that the looping-in wire is broken.

NEWPORT'S question in our last issue has aroused some interest, and we have heard of a recent case in which the deduction, by a firm of consulting engineers, of their subscriptions to the Institution of Civil Engineers, and other professional institutions in their income tax returns, has been allowed, as it certainly should be.

BLACKFACE.—"Electrical Practice in Collieries," by Professor D. Burns (third edition, published last year), post free, 7s. 10d. "Electricity as Applied to Mining," by Professor A. Lupton, G. D. A. Parr, and Herbert Perkin (second edition, published 1906), post free, 12s. 5d.

ENQUIRER writes us that the "Cricket Pitch Rule" is mentioned in the City and Guilds of London Institute's prospectus of examinations in Electric Wireman's Work, and asks us what it means.—There is one volt drop on a *20 yards run* at 1,000 amperes per square inch. We do not know who invented the name "Cricket Pitch Rule" for the benefit of the City and Guilds examiners; the name is unfamilar to the majority of wiring contractors and consulting engineers.



SCALES OF MOVING IRON INSTRUMENTS

THE most perfect scale from the point of view of even division is that of the moving coil instrument. This, unfortunately, is not available for alternating current. The nearest approach to it is the induction instrument, but its expense is too great to justify its use in many cases, and

MOVING IRON AMMETER.

recourse must be had to the moving iron instrument. The British Westinghouse Co. have recently brought out a line of such instruments, which, although differing but little in general construction from other instruments of its class, possesses an exceptionally good scale owing to the special shape of the armature, the result of lengthy experiments.

CURVES REPRESENTING SCALES OF DIFFERENT MAKES OF INSTRUMENT.

An ammeter of this series is illustrated here, and a diagram is also given showing the relation of scale length to scale reading for this instrument compared with an ideal straight-line scale, and the scales of a number of instruments of well-known makes. The thick line represents the new Westinghouse scale, and a dotted curve has been added to show the scale of an induction instrument.

The Municipal Wiring Bill.—Barking and Tynemouth have promised to support this Bill and contribute to the cost of its promotion. Stepney has promised "moral" support, and will consider the question of giving financial support when the Bill has been deposited.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 29th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

18,583/09. **Automatic Sign Switches.** R. F. Venner and R. C. Griesbach (London). The slowly rotating contact-drum of a changing illuminated sign is combined with an intermediate quick-acting carbon-break switch, which comes into action immediately before the actual lamp contacts are operated. The intermediate switch is worked by a compound cam consisting of a slotted disc on a rotating shaft and a spring-controlled cam loose on the same shaft. Seven figures.

19,949/09. **Lamp Fitting.** E. Imer (Geneva). This specification covers a totally enclosed dust-proof fitting comprising an upper reflector, an inverted translucent bowl, and an intermediate cylindrical cover of clear glass, as was described and illustrated in Electrical Engineering, December 2nd, 1909, Vol. V., p. 1040. Three figures.

20,435/09. **Ceiling Rose with Detachable Plug.** A. H. Shaw (Blackburn). To facilitate the removal of pendants suspended by flexible from ceiling roses, the flexible is secured to a plug, which is fixed into the ceiling rose by a side screw. Contacts on the plug engage with corresponding contacts in the ceiling rose. Four figures.

20,639/09. **Heating and Cooking Apparatus.** A. F. Berry (Ealing). This specification describes apparatus in which a large mass of metal of great heat capacity is heated up continuously or at times when power can be obtained cheap, and the heat utilised at intervals. Blocks of suitable material are enclosed in heat-insulating covers, and when the heat is required the covers are either taken off or a metal plate is put in contact with the block in order that the heat may be transferred by conduction. Various arrangements with self-contained transformers for A.C. circuits are also described. Ten figures.

20,815/09. **Meter and Method of Charging.** Siemens Bros. Dynamo Works, Ltd., and F. Lydall. A meter is described which records at a rate depending upon the irregularity of the demand. It thus retains the essential feature of the maximum demand system with the advantage of only one instrument and a direct reading. The system consists in charging at a fixed rate per unit multiplied by a variable factor representing the degree of irregularity. This factor is the ratio of the root mean square value of the current over a long period, such as a quarter-year, to the average current. The speed of the meter is made proportional to the square of the current, and it records the mean square of the amperes flowing over a predetermined period multiplied by the square of the supply voltage, and the square of the number of hours in the period, divided by one million. The construction of the instrument is described. Four figures.

22,997/09. **Heating Apparatus.** H. A. Kent (London). Heating elements are constructed by enclosing tungsten in a granular form in silica glass tubes having electrodes fused in at each end. The tubes are exhausted, or many contain a residue of an inert gas.

23,416/09. **Voltage Regulation.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). In order to produce a compounding effect in A.-C. circuits, two transformers are connected with their primaries in series with each other and in shunt to the supply, and their secondaries in series with each other and with the load. One transformer has a saturated and the other an unsaturated core, and the relative connections are reversed so that the secondary voltages are in opposition. At no load the voltages are equal and opposite, but as the load increases, the magnetisation of the unsaturated transformer is increased. This increases its voltage, and thus raises the main voltage. One figure.

25,273/09. **Wood Separators for Storage Batteries.** Tudor Accumulator Co., Ltd. (*Accumulatoren Fabrik A.G., Berlin*). In order to remove acids and other constituents from wood separators for storage batteries, they are treated by a solution of sulphuric acid or of caustic potash, and afterwards washed in water. They are then soaked in a 10 per cent. solution of glycerine before drying, in order to prevent warping or cracking.

26,005/09. **Ventilation of Motors.** H. A. Mavor and Mavor & Coulson, Ltd. When a fan is fitted to a motor for ventilating purposes, it does not always co-operate with the natural ventilation due to the radial passages in the armature, and eddy currents are produced. To prevent this, two radial type fans are arranged at the same end of the motor; one supplements the action of the armature passages, and the other forces air through the field system in the opposite direction. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Rustige [Vapour lamps] 20,853/09; Cibie, 21,008/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: Anderson, Russell and Gray [Distribution system] 21,219/09; Highfield [Manufacture of cables] 22,287/09; W. T. Henley's Telegraph Works Co., and Penning [Cable connectors] 25,449/09; Witzenmann [Cable armouring] 28,178/09; Woodward [Cable armouring] 28,291/09.

Dynamos, Motors, and Transformers: Fitz [Dynamos] 30,333/09; W. A. Stevens, Ltd., Stevens and Lambert [Brushes] 1,145/10; Farny [Machines] 4,907/10; Siemens Bros. Dynamo Works (*Siemens-Schuckertwerke Ges.*) [Armature windings] 8,410/10 and [Polyphase motors] 10,172/10; Allgemeine Elektricitäts-Ges. [A.-C. commutator machines] 10,692/10.

Instruments and Meters: Cambridge Scientific Instrument Co. and Whipple [Radiation pyrometer] 21,369/09; Van Driel [Instrument for recording audible signals] 855/10; Oehring [Switch for prepayment meters] 4,883/10; Siemens & Halske A.-G. [Receiving and recording devices for signals] 13,985/10.

Storage Batteries: Taylor [Charging systems] 18,636/09.

Switchgear, Fuses, and Fittings: Cowper-Coles [Lamp reflectors] 16,304/09; Wakefield [Hand-lamps] 20,764/09; Walters [Automatic voltage regulator for machines in parallel] 20,869/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Selective switch systems] 21,303/09; Schultz and Holt [Switches] 25,278/09; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Switches] 2,748/10; Hanwell [Anti-vibration lamp-holders] 5,384/10; Newton (*Kelly*) [Switches] 7,276/10.

Telephony and Telegraphy: Ball and Readman [Telegraph insulators] 22,878/09; Burney and Sterling Telephone & Electric Co. [Intercommunication telephones] 28,951/09; Deutsche Telephonwerke Ges. [Automatic telephone systems] 7,851/10; Thompson (*Arco and Rendahl*) [Variometers for electrical oscillations] 8,018/10; Lee [Automatic telephones] 10,162/10.

Traction: Hadfield [Tramway points] 24,516/09; Metcalfe [Vacuum brakes] 27,802/09; Bate [Signalling] 29,978/09; Patterson [Electric cab signalling] 3,637/10; Windhoff [Brake mechanism] 11,057/10.

Miscellaneous: Winter [Vacuum tubes] 29,143/09; Wallis [Electrical apparatus for perforating designs] 3,825/10; Lugard [Electromagnetic clutch] 12,259/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, &c.: Specialfabrik für Aluminium Spulen und Leitungen Ges. [Production of insulating oxide film on wire of bare aluminium wire coils] 20,634/10; Allgemeine Elektricitäts-Ges. [Starting machines] 20,759/10.

Electrometallurgy, &c.: Gibbs [Electrolytic manufacture of wire] 19,593-4/10; Levoz [Electrical production of steel] 20,594/10; Consigliere [Electro-deposition] 20,776/10.

Instruments, &c.: Strelow [Ferraris meters] 21,240/10.

Traction: Cooper [Gear for electric vehicles] 18,850/10.

Miscellaneous: Molière [Electromedical apparatus] 20,760/10.

The following amended Specification can now be obtained.

Salpetersäure Industrie-Ges. [Arc furnace for treating gases] 19,466/09.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, &c.: Johnson-Lundell Electric Traction Co. (*J. G. V. Lang, Germany*) [Control of traction motors] 13,564/04; W. O. Duntley [Breast-drill motors] 13,724/04.

Electrometallurgy, &c.: W. Elworthy [Ozone generator] 12,612/99.

Incandescent Lamps: S. Horvath and Utility Co., 12,598/05.

Instruments, &c.: S. H. Holden and Chamberlain & Hookham [Electrolytic meters] 13,223/04.

Storage Batteries: F. T. Kelly, 12,253/05.

Switchgear, &c.: J. N. Goodall [Wiring conduit] 12,242/05.

Telephony, &c.: J. Gell [Tape mechanism for telegraph instruments] 13,109/03.

Miscellaneous: E. Lytton [Electric scenery-raising gear] 13,364/03.

OSRAM LAMP ADVERTISING

"OSRAM Lamps make electricity cheaper than gas," is the keynote of the General Electric Company's advertising for the autumn season. The company has prepared a very large assortment of advertisement folders, price

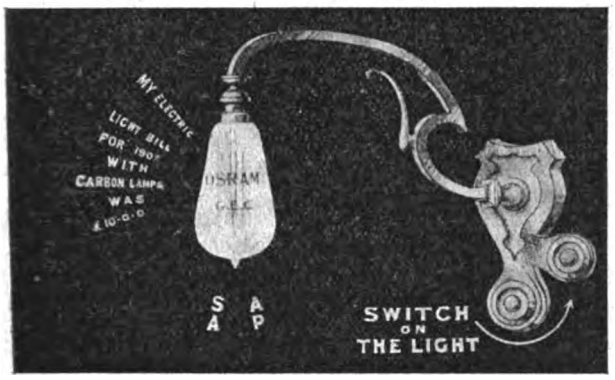

Fig. 1.

lists, picture postcards, novelty cards, picture albums, leaflets, invoice forms, adhesive labels, showcards and window bills, all of which are offered to the trade printed with the contractor's name and address on free of charge, and we recom-

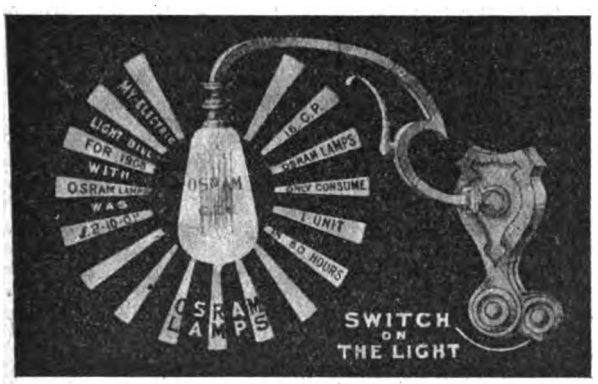

Fig. 2.

mend our readers to make early application for these. A dozen different designs have been sent us as specimens, most of which are extremely effective. These include some new matter, and the best of the older designs which have done

Fig. 3.

such good service hitherto. One of these is illustrated in Figs. 1 and 2. It is a card representing a lamp on a bracket, with the words seen in the figure appearing on a black background. On moving down the little cardboard switch handle at the left of the card, the appearance of the card is changed to that shown in the second figure, emphasising the gain in replacing carbon lamps by Osram lamps. Fig. 3 is a reproduction of a large poster which is being displayed in selected towns through the United Kingdom in well selected and prominent positions. The size of the poster is 120 in. by 80 in., and it is printed in eight colours. Copies are offered to all contractors who care to display it on their premises, with an additional slip to place underneath, bearing the words, "Sold here," and picture postcards with the same illustration are also available. So far as street lighting is concerned, the Osram lamps have made great progress, and we are informed that over 140 towns in this country use Osram lamps for street lighting, in most cases in replacement of gas lighting.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

HARDENING FURNACES.—A leaflet from S. N. Brayshaw, 2 Mulberry Street, Hulme, Manchester, contains particulars of the latest improvements that have been made in the well-known Brayshaw gas- and oil-heated salt bath furnaces for hardening steel. An entirely new form of burner is used, without air blast and the arrangement of the melting-pot has been somewhat altered so that it is impossible to splash the salt on to the outside. The scaling of the pot, and the emission of the salt fumes are thus avoided. The new burner also consumes much less gas.

BOILER FITTINGS.—A leaflet from the Crosby Steam Gauge & Valve Co. (147 Queen Victoria Street, London, E.C.) describes the Crosby feed water regulator, and illustrates its use on the main feed pipe, and as a control valve for the feed pump. It is drawn up by the Engineers' Standardised Publications Association, and an index card is sent out with it.

BATTERY LAMPS.—Another list issued by the Engineers' Standardised Publications Association describes the "Thomson" patent lamps for inspection, police, and pocket use, also cycle lamps. The sole agents for these are H. E. Wilson & Co. (20 Cross Street, Manchester).

METERS.—A new pamphlet from the Allgemeine Elektricitäts-Gesellschaft. enumerates the various types of electricity meters constructed by that firm, and discusses the applications and special features of each pattern.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

D.C. MOTORS AND GENERATORS.—An illustrated booklet just issued by Crompton & Co., Ltd. (Salisbury House, London Wall, London, E.C.) gives particulars and prices of five different types of standard enclosed D.C. motors. These are manufactured in fourteen sizes of from 2 to 125 B.H.P., a large number of windings giving a wide range of speed being standardised for each size. The five types are protected, semi-enclosed, dust-proof, pipe-ventilated, and totally-enclosed, respectively. Geared motors with various ratios up to 4·5 to 1, field regulators, starters and a line of series reversible crane motors, are also listed. A table of outputs of the above motors when used as dynamos is also given.

MERCURY-VAPOUR CONVERTERS.—A leaflet from the Westinghouse Cooper Hewitt Co., Ltd. (151 Great Saffron Hill, Holborn Circus, London, E.C.) describes the latest design of mercury-vapour converters for supplying direct current for battery-charging and other purposes from an A.C. supply. These have capacities ranging from 3 to 30 amperes, and the largest size (7—30 amps.) is listed for three-phase as well as single-phase circuits. A table of comparative charging costs with mercury-vapour converters and motor-generators shows a considerable margin in favour of the former. We understand that the Post Office and the National Telephone Co. are using these converters.

BLUE-PRINTING.—Another leaflet from the Westinghouse Cooper Hewitt Co., Ltd., describes a blue-printing outfit, comprising two mercury-vapour lamps mounted in a special reflector.

ARC LAMPS.—The Gilbert Arc Lamp Co., Ltd. (Chingford, Essex), have issued a new catalogue of arc lamps and accessories illustrated with photographs of the various types of lamps and different patterns of cut-outs, switches, resistances, &c. The lamps listed include the "Flamme" four converging carbon pattern, the "Beacon" flame lamp recently described in Electrical Engineering, and enclosed lamps. A useful feature of the catalogue is a group photograph of the spare parts of each lamp, each part being numbered and priced in a key list.

ARC LAMPS.—An illustrated list is to hand from the A. E. G. Electric Co., Ltd. (Pembroke House, 133 Oxford Street, London, W.). The general features of the A. E. G. lamps are described, and brief particulars of the "Sunshine" and "Blondel" flame lamps are given. The latter has vertical carbons. Transformers and resistances are also listed.

Digitized by Google

LOCAL NOTES

Aberdeen: *Bonus Scheme.*—The proposal of the Borough Electrical Engineer to institute a bonus system for the encouragement of employees has been rejected by the Council.

Bath: *Electric Tramways.*—The Bath Electric Tramways Co. are applying to the Board of Trade for an extension of time for the construction of the light railway to Saltford, authorised under an Order granted in 1906.

Street Electric Lighting.—Metal filament lamps are gradually displacing gas, and in some cases arc lamps, in the streets of Bath. The 100-c.p. Osram lamp is being adopted, and already 112 have been installed. As the Gas Company's contracts expire, the new method of lighting is being substituted.

Bedford: *Electricity Accounts.*—The loss on the electricity undertaking to March, 1910, of £1,007 was the subject of some comment at the last meeting of the Town Council. It was pointed out that the estimates for 1909–10 show a loss of only £369, and it was suggested that the estimated loss of £110 for the present year might be equally wide of the mark, but the Chairman of the Electricity Committee stated that a sub-committee is investigating the working of the electricity department, and will report to the Council later on. At present it seemed that there would be a profit at the end of March, 1911, instead of a loss as estimated.

Belfast: *Cavehill and Whitewell Tramways.*—An arbitrator is to be appointed to determine the price to be paid by the Corporation for the undertaking of the Cavehill & Whitewell Tramways Co.

Cardiff: *Tramways Accounts.*—Mr. Arthur Ellis, the Tramways Manager, reports a profit of £11,000 from the tramways in the past year, against £5,954 in the previous year. In July, 1909, the receipts began to fall off considerably, but since the inauguration of a new system of fares the whole of the lost ground has been recovered with the satisfactory results shown above.

Dartford: *Electricity Accounts.*—The accounts for the year to March 31st show a net profit of £628 after meeting capital charges, compared with £57 in the previous year. The power supply shows an increase of 73 per cent., compared with 1909. All the Nernst lamps which have been used for street lighting hitherto have been replaced by Tantalum lamps.

Derby: *Tramway Accounts.*—There was a net profit of £3,649 on the tramways for the year to March 31st, compared with £3,733 in the previous year.

Dundee: *Peters Electrical Engineering Laboratory.*—Professor Ernest Rutherford will formally open the new Peters Electrical Engineering Laboratory at the University College to-day.

Finchley: *Underground Telephone Wires.*—A difference between the Postmaster-General and the District Council with regard to the erection of overhead telephone wires, which the Council insist should be laid underground, has been referred to the Barnet County Court for hearing.

Gateshead: *Tramway Extensions.*—Some extensions of the Gateshead & District Tramways Co. were inspected on behalf of the Board of Trade on Friday. The additions bring the total length of the system up to 18½ miles.

Halifax: *Proposed Tramway Extensions.*—Deputations from the Elland, Barkisland, Soyland & Rishworth District Councils have waited upon the Tramways Committee asking for the extension of the tramways to that district.

Hastings: *Live Studs.*—A van horse was killed last week through coming into contact with a "live" stud on the Dolter system running along the front.

Leeds: *Trolley Omnibuses.*—Arrangements are being made for an early commencement of the work of equipping the route from City Square to Farnley for trolley omnibuses.

Leek: *Electric Supply.*—It is proposed to ask the Stoke County Borough to allow their Chief Electrical Engineer, Mr. C. H. Yeaman, to report upon some proposed extensions of the Electricity Works at a fee of 10 guineas.

Llanelly: *Electric Lighting.*—A start has been made with laying the cables for the local electric supply company's undertaking. The District Council have given the Gas Company six months' notice to discontinue the street lighting. Electricity will be adopted for the whole of the streets of the borough from January 1st.

London: *Hampstead: Electrical Exhibition.*—An exhibition of electrical appliances was opened at the Finchley Road Baths on Tuesday, and continues until Saturday. We hope to publish a fuller account of it in our next issue.

Chelsea: Tramways.—The Council have refused their consent to the proposal of the London County Council to construct tramways to link up the Borough with Kensington and Battersea.

Kensington: Tramways.—The Council have also refused their consent to the tramways connecting up Kensington and Battersea.

Marylebone.—The June quarter's report on the working of the electricity undertaking shows an increase in units supplied of 113,447, or 6·3 per cent., compared with the corresponding period last year. This does not include public lighting. The accounts show a trading profit for the quarter of £15,48[illegible] to meet capital and special charges, compared with £15,18[illegible] the previous June quarter. There was a loss on the [illegible] department of the quarter of £509.

Poplar: Electricity Accounts.—The net profit on the electrical undertaking for the year to March 31st was £4,42[illegible]

Stepney: Objections to Trolley System.—The Works Committee recommend the Council to refuse consent to the [illegible] of the overhead trolley system by the London County Council in Burdett Road and Grove Road. The County Council draw attention to the heavy cost of the conduit system and the fact that the trolley is already used in Stepney, but the Borough Council reply that at the time they consented to the introduction of the trolley system, they did so on the understanding that it was not to be regarded as a precedent.

Middlesbrough: *Noise of Tramcars.*—The Borough Engineer has reported to the effect that the noise from the tramways, which has been complained of recently, is due both to the wet condition of the track and of the tramcars. A copy of the report is to be sent to the Tramway Company.

Newport (Mon.): *Trolley Omnibuses.*—The Borough Electrical Engineer has reported upon the adoption of trolley omnibuses in the town, and recommends the Tramways Committee to keep the possibility of this method of traction in mind. The Committee will no doubt, he says, have to go to Parliament in the near future for powers to construct additional tramways, and that would be an opportunity for obtaining powers to adopt trolley omnibuses as feeders.

North Middlesex: *Electric Supply Mains.*—The North Metropolitan Electric Power Supply Co. are laying trunk mains through Enfield, Southgate, and Wood Green.

Paisley: *Price of Tramway Energy.*—An Arbitration under the Paisley District Tramways Order Confirmation Act, 19[illegible] to settle the price to be paid for the electrical energy for the next seven years by the Paisley District Tramways Co. to the Paisley Corporation, will start on Friday next, October 7th, at the Westminster Palace Hotel. The arbitrator appointed is Mr. Robert Hammond, and the engineers engaged in the case are Messrs. Mordey & Dawbarn on behalf of the Paisley Corporation, and Mr. Horace F. Parshall on behalf of the Paisley District Tramways Co.

Rotherham: *Trolley Omnibuses.*—After a long discussion the recommendation of the Tramways Committee to apply for powers, to run trolley omnibuses in a large number of districts, has been carried.

Southampton: *Tramways.*—The Council have decided to apply for Parliamentary powers to construct tramways in High Street, Town Quay, and Royal Pier, to Southampton West Station, and *via* The Avenue to the Borough boundary.

South Wales: *New Works.*—It is reported that two large schemes for the establishment of industrial works at Port[illegible] are in contemplation. These will include coke ovens, steel works, and tinplate and galvanising works, which will have their own power station.

Watford: *Trolley Omnibuses.*—A long discussion took place at the last meeting of the Council with regard to the proposal of the Hertfordshire County Council to seek powers to run trolley omnibuses through Watford, opinions being somewhat divided on the point, but no resolution was carried.

West Bromwich: *Electrical Extensions.*—At a recent Local Government Board inquiry into a loan of £11,386 for electrical extensions, Mr. H. R. Hooper, the Inspector, suggested that it would have been wiser to adopt an alternating current system instead of direct current. The Borough Electrical Engineer has prepared a report upon this proposal. He sees no reason to spend an additional £2,000 in putting down alternating current plant in view of the fact that direct current supply has effectually met the demand for power purposes in the past.

West Ham: *Tramway Accounts.*—The net profit on the tramways undertaking during the past year, after meeting capital charges, is £3,757. This amount the Council have decided to devote to relief of rates, although a large number of the members desired that it should be placed to reserve fund.

Digitized by Google

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Aberdeen.—A loan of £55,000 is to be applied for, for extensions to the refuse destructor in order to supply additional steam to the electricity works.

Bexhill.—Extensions are contemplated at the Electricity Works at an estimated cost of £4,500.

Chester-le-Street.—Tenders are invited for the installation of electric light and power at the Infectious Diseases Hospital and for 600 yards of overhead transmission line. Particulars from the Clerk, and tenders by October 19th.

Dundalk.—A loan of £20,000 for electric lighting has been sanctioned.

Halifax.—Tenders are invited for a 1,500 kw. turbo-alternator; two 750 kw. rotary converters with transformers; and switchboard. Particulars from the Borough Electrical Engineer, and tenders by October 17th.

Hornsey.—A loan of £6,000 for mains and services is to be applied for.

London: *Hampstead.*—Mains are to be laid in Gainsborough Gardens and Fairfax Mews at an estimated cost of £91.

Marylebone.—The Electricity Committee recommend an expenditure of £1,000 upon mains.

Stepney.—The Electricity Committee recommend a further expenditure of £7,150 upon plant for the Blyth's Wharf generating station.

Mains are to be extended in Mile End Old Town, Whitechapel, and Spitalfields.

Oldham.—The Electrical Engineer reports that the maximum load last winter was 3,318 kw., and the total plant capacity 3,160 kw., and suggests the installation of a 1,200 kw. mixed pressure turbine.

St. Helens.—Sanction has been given to a loan of £10,206 for buildings, switchgear, transformers, rotary converters, water softening plant, &c.

Stoke-on-Trent.—The Chief Engineer has been instructed to report upon the financial position of the electrical undertaking with special reference to over-expenditure and prospective borrowings.

Walsall.—An inquiry was held last week concerning a loan of £23,225 for electrical extensions. Some time ago the Town Council applied for a loan of £35,000, but to this the Local Government Board withheld their sanction, and certain suggestions then made by the Inspector have since been under consideration. The Town Clerk stated that an offer had been made by the Shropshire Power Co. to supply energy in bulk at 0·75d. per unit, subject to a minimum supply of 2,500,000 units per annum; but the Borough Electrical Engineer had satisfied the Committee that he could, with the new plant proposed, generate at 0·52d. per unit, a claim which was supported by the fact that during the past six months he had, with the existing plant, been generating at 0·62d. per unit.

West Bromwich.—An additional feeder at an estimated cost of £480 is to be laid.

West Hartlepool.—The Council are considering a proposal to utilise the waste heat from the furnaces of the Seaton Carew Iron Co. for the purpose of generating electricity. If the scheme is adopted, a new generating station will be erected at an estimated cost of £20,000.

York.—Extensions to the generating plant are to be carried out.

MISCELLANEOUS

Australia.—Tenders are invited by November 23rd, by the Deputy Postmaster-General, Brisbane, for phosphor-bronze wire and galvanised iron wire, cable, telephone and telegraph instruments, switchboards, measuring instruments, &c. Particulars from 73 Basinghall Street, London, or the Australian Commonwealth Offices, 72 Victoria Street, London, S.W.

Brazil.—The sum of £25,500 has been allocated by the Government for the construction of a telegraph line from the State of Matto Grasso to that of Amazonas.

Japan.—A British consular report states that a concession has been obtained for a tramway to Sahai, a prosperous city six miles to the south of Osaka. A number of other schemes are also being considered.

South Africa.—The Johannesburg Corporation are inviting tenders for five electric tramcars. Specifications, &c., may be seen at 73 Basinghall Street, London.

Wolverhampton.—Extensions are to be made to the refuse destructor in order, among other things, to be able to supply steam more regularly to the Electricity Department.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Church in Salusbury Road, Kilburn.

Tenders are invited by the West Ham Union for the wiring of the Receiving Homes at Aldersbrook Road, Wanstead. Particulars from Mr. W. Jacques, 2 Fen Court, London, E.C.

Building in Henrietta Street, Marylebone. Architects, Messrs. Belcher & Johass.

Additions to restaurant accommodation at Charing Cross Hotel.

Assembly Hall and Electric Theatre, Finchley.

Central Cooking Depôt at Tottenham. Education Committee.

Extension of Hammersmith Workhouse buildings.

It is stated that Mr. Oscar Hammerstein has now arrived in London in connection with his scheme for an opera house in Kingsway, and that an architect is engaged on the plans.

Block of schools in Southbury Road, Enfield. Architect, G. E. T. Laurence, 22 Buckingham Street, Adelphi, London.

P.O. Sorting Office, Deptford. H.M. Office of Works.

Enlargement of Census Offices. H.M. Office of Works.

Extension of Territorial Headquarters, Chiswick. War Office.

PROVINCES.

Aberdeen.—Lending Library. Libraries Committee.

Barnard Castle.—Alterations to Workhouse.

Bournemouth.—New Workhouse Infirmary.

Brighouse.—Proposed erection of public baths.

Carnarvon.—Council Chamber and Offices.

Chelmsford.—Additions to Grammar School.

Chester.—Annexe at Upton Asylum. Architect, H. Beswick, Newgate Street.

Coventry.—South Street Council Schools.

Doncaster.—Theatre of Varieties in Silver Street.

Dudley.—Alterations at Holly Hall School.

Galway.—Proposed sanatorium. Town Clerk.

Glasgow.—Theatre in Govan Street.—Three-storey building at 250 Crown Point Road. Architect, John Burnside.—Extension of offices, boiler house, &c., at Ruchill Oil Works. Architects, Messrs. Kyle, Dennison & Laing.—Rebuilding John Anderson's Royal Polytechnic. Architects, Messrs. Clark & Bell.—Labour and telephone exchange, College Street. Clerk of Works, G.P.O., Hanover Street.

Govan.—Electric theatre, Park Street. Architect, Mr. N. C. Duff, 115 Wellington Street, Glasgow.

Isle of Thanet.—Electric theatres at Margate, Broadstairs, and Ramsgate. Margate, Broadstairs, and Ramsgate Electric Theatres, Ltd.

Liverpool.—Additions to workhouse, Ruthin.

Peterborough.—Additional accommodation at Infirmary.

Reigate.—Conversion of existing buildings into disinfecting station. Borough Surveyor.

Southampton.—Proposed new college at Highfield. Hartley University.

St. Albans.—Parochial Hall and Institute. Abbey parish.

Sunderland.—Alterations to Bede Collegiate School. Education Committee.

Swansea.—Buildings for the Glamorgan County Territorial Force Association. Capt. C. J. Wilkie, 20 Dumfries Place, Cardiff.

Swindon.—Branch of London & Provincial Bank, Wind Street.

Warrington.—Elementary school, Lower Wash Lane.

Watford.—Additions to Printing Works, Bushey Grove Road. Messrs. André & Sleigh.—New science and art rooms, Royal Masonic Schools.

Wolverhampton.—Twenty-six houses, Woden Road. H. Stocking.—Extension to Star Engineering Co.'s Works, Dobs Street.—Additional workshops, Sunbeam Motor Car Co.

OSRAM·LAMPS

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

Aldershot.—The Council have decided to purchase a Bennis mechanical stoker at £205.

Argentine.—According to the *Review of the River Plate*, the tender of Messrs. Winby & Co. for the installation of electric tramways in Santa Fé is recommended for acceptance. It is expected that a contract will shortly be signed with Messrs. Agar, Cross & Co., the South American representatives of the British Westinghouse Co., for the construction of electric tramways in Mar del Plata.

Blackpool.—The Council have accepted the tender of Messrs. David Rowell & Co., London, for five new tramway shelters; and the Brush Electrical Engineering Co., Ltd., for a new 40-h.p. motor for use at the Refuse Destructor.

Chelmsford.—The tender of the Electrical & Motor Co., Banbury, has been accepted for the electric lighting of the Trinity Road School at £175.

Bury.—The tender of Messrs. G. Freeman & Sons has been accepted for condenser pipes for the new power house.

London: *Hampstead.*—The Council have renewed their contract with the Aron Meter Co. for the maintenance of their Aron meters at 2s. per meter per annum.

Marylebone.—A second coal grab for the electricity works is to be supplied by Messrs. S. Williams at £85.

APPOINTMENTS AND PERSONAL NOTES

Mr. J. G. Potts, at present on the staff of the Bury Electricity Works, has been appointed Clerk of Works in respect of the electrical plant at the Corporation's new power station, at a salary of 50s. per week.

Mr. C. H. Yeaman, Chief Electricity Engineer to the County Borough of Stoke-on-Trent, has been presented with a case of pipes and a book on "Higher Mathematics" by the staff of the Hanley Electricity Works.

Mr. W. A. Turnbull, at present Chief Assistant Electrical Engineer to the city of York, has been appointed Resident Engineer at the Stoke-on-Trent Electricity Works under Mr. C. H. Yeaman, Chief Electrical Engineer to the County Borough of Stoke-on-Trent.

On the occasion of the conversazione and dance of the Robertson and Osram Social and Athletic Club next Saturday, a portrait of the chairman, Mr. H. Hirst, which has just been completed by Prof. Sir Hubert Von Herkomer, R.A., will be presented to Mrs. Hirst by the shareholders of the Company.

A Laboratory Demonstrator is required in the Electrical Engineering and Allied Physics Department of the Northampton Polytechnic. Commencing salary £100 per annum. Also junior demonstrator, £80 per annum. (See an advertisement on another page.)

A General Manager or Works Manager is required by a leading manufacturer of magneto machines. (See an advertisement on another page.)

An Assistant in the Ipswich Corporation mains department is required. (See an advertisement on another page.)

O. B. Richardson, engineer in charge at Whiston Street, Shoreditch, has resigned. A successor is to be advertised for.

A correspondence clerk is required in the Swindon Electricity & Tramways Department. Salary £50 per annum. Applications to the Town Clerk by October 10th.

A collector is required in the Sheffield Electricity Department. Salary £120 per annum, rising to £150. Applications to the General Manager by October 8th.

Mr. B. Waite, district manager of the National Telephone Co., at Cardiff, has been presented with a silver cigarette case and matchbox on the occasion of the taking over of the exchange by the Post Office.

Next Year's Exhibition at the White City.—It has been decided to hold a "Coronation" Exhibition next year at the "White City," Shepherd's Bush, at which all parts of the British Empire are to be represented. A portion of the receipts, guaranteed not to be less than £5,000, will be devoted to the Mansion House Fund for a national memorial to the late King Edward VII.

Ventilation on Board Ship.—A decision given recently by Judge Rentoul in the City of London Court will be of some interest to the suppliers of electric fans. In this case Mr. Justus Eck (of the Union Electric Co.) recovered damages from the Union-Castle Steamship Co. to the extent of a charge that has been made for extra accommodation, rendered necessary by the insufficient ventilation of a cabin originally allotted to his wife. It was held by the Judge that the advertising literature of the steamship company led one to expect electric fans in every cabin, and that had a fan been provided the company would not have been liable, however bad the ventilation.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 5s. (last week, £57 15s. to £58).

Foster Engineering Co., Ltd.—Owing to increase in the variety of manufactures, the name of the Foster Arc Lamp & Engineering Co., Ltd., has been changed to the Foster Engineering Co., Ltd. The Company have now amalgamated with the Brockie Pell Arc Lamp Co., and will in future supply all apparatus made under the patents and rights of both Companies. Both Companies' offices, stores, works, &c., have been removed to new works in Morden Road, Wimbledon, London, S.W.

The Abbey Electric Co.—The new telegraphic address of the Abbey Electric Co. was given incorrectly in our last issue. It should have been "*Lightsome, London.*"

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Dick, Kerr & Co.—The annual meeting was held on Thursday. Mr. J. Kerr, who presided, expressed the extreme regret of the Board that the unfortunate accident which resulted in the death of Mr. George Flett in July. With regard to the business prospects, he stated that after three years of dull times, a period seems to be at hand when there will, in many directions, be a great expansion of electrification in this country and abroad. The past year was a disappointment to them all, but the directors were of the opinion that the work at present in hand, and in prospect, made the outlook distinctly encouraging. The financial position of the company was one of comfort. In conclusion, mention was made of the company having taken up the manufacture of Bergmann steam turbines.

Willans & Robinson.—There is a loss of £8,001 on the June half-year's trading, making a total debit of £15,269. This unsatisfactory result is attributed to the low prices prevailing, and the scarcity of orders obtainable during the whole of 1909. There has, however, been a steady improvement in the number of orders booked during the present year, although the prices are on even a lower scale than in 1909, and the report states that until there is a material improvement in the prices, it will not be possible to show a profit.

Mexican Light & Power Co.—One per cent. on the ordinary shares for the September quarter.

Cleveland & Durham Electric Power Co.—The net profits for the year to June 30th were £2,906, compared with a loss of £3,657 in the previous year.

British Thomson-Houston Co.—The report and accounts were adopted at the meeting on Wednesday last week. Mr. J. F. Nauheim, who presided, said that whilst the accounts showed a distinct improvement on the previous year, the directors did not consider they warranted payment of a dividend. It was only by the strictest economy that the directors had been able to cope with their difficulties. It was hoped that the shareholders would reap the benefit of the large extensions to the works which had been carried out during the year.

British Westinghouse Electric & Manufacturing Co.—It is stated by the *Stock Exchange Gazette* that the results of the year's trading so far have exceeded anticipations, and that the accounts for 1910 are likely to show a working profit of well over £100,000.

NEW COMPANIES

NUNEATON ELECTRICAL CONTRACTING CO., Abbey Gate, Nuneaton.—Capital £1,000. Dealers in electrical fittings, appliances, &c.

ALLMANA SVENSKA ELECTRIC CO.—Registered by Bristowe, Cooke & Carpmael, 1 Copthall Buildings, London, E.C. Capital, £5,000. Dealers in electrical and other machines and appliances. The subscribers are S. Busch, Norfolk House, Cannon Street, London, and J. L. Fuller, of the same address.

Telegraph Traffic.—The line between Rome and Constantinople broke down on the 27th ult., but was put right on the same day. On Oct. 1st the cable of the Compagnie Française des Cables Télégraphique, in the West Indies, between Paramaribo (Dutch Guiana) and Cayenne (French Guiana), was interrupted. —The El Arich route broke down on the 3rd inst. between Adana and Lattaquil.

SUMMARY

A standard specification for lamp holders has been published by the Engineering Standards Committee. (Page 643.)

The arbitrator in the recent proceedings between the Torquay Tramway Co. and the Torquay Corporation has declared that the latter have unreasonably withheld their consent to the adoption of the overhead trolley system on the Torbay Road. He gives costs against the Corporation. The majority of the members of the Corporation are in favour of accepting the award. (Page 643.)

An article from "The Wiring Contractor's Point of View" discusses the status of the Wiring Contractors' Association, and reviews Mr. G. F. Ratcliff's suggestions for improving it; it incidentally quotes some of the Wiring Rules of the Institution of Electrical Engineers which are frequently contravened in practice. (Page 644.)

The first news of the Portuguese Revolution was transmitted to the rest of the world by wireless telegraphy. (Page 644.)

The attention of the Newport Corporation has been called to the fact that the payment of interest upon bank overdrafts in respect of the Electricity Department is illegal, as laid down in the recent decision in the West Ham case, and the solicitors of the Ratepayers' Association request that certain sums paid for interest in this way should be refunded. The Electricity Committee have the matter under consideration. (Page 644.)

Our monthly article on new electrical supplies and accessories contains illustrated descriptions of two new forms of mercury vapour lamp. Some accessories for interior conduit wiring, including a new water-tight switch, are also described. Several heating and cooking appliances are illustrated, among which is a new towel drier. (Page 645.)

A letter from the Diesel Engine Co. refers to the business announcement made by Messrs. Willans & Robinson in a recent issue with regard to the manufacture of this class of engine. (Page 647.)

Among the specifications published by the Patent Office on Thursday last was one by L. D. Cibie for a flame arc lamp of the stop pattern, with the vertical negative carbon held in a guiding socket pivotted in the base plate.—A two-battery train-lighting system, in which both batteries supply the load when the dynamo is running slowly, is covered by the India Rubber & Gutta Percha Telegraph Works Co.—J. S. Highfield patents a method of manufacturing cheap wiring cable of the strip type with the conductors embedded in the two edges.—The provision of a notch or recess in the sides of carbon brushes for enabling the finger lever to hold them up temporarily is covered by W. A. Stevens, Ltd. (Page 648.)

An arbitration is being held to determine the price

Digitized by Google

which the Paisley District Tramways Co. shall pay the Corporation for the electrical energy for working the trams. Mr. Robert Hammond is acting as arbitrator. The company at present pay 1·4d. per unit, but the Clyde Valley Electric Power Co. offer to supply at 0·78d. per unit. (Page 649.)

The new generating station of the Northampton Polytechnic Institute contains two 100-kw. gas-engine sets generating at 220-volts D.C. and 2,200 volts three-phase. The oil switches of the A.-C. circuits are controlled from a modern desk-type board equipped with the latest instruments and auxiliary appliances. A 45 h.p. synchronous motor-generator set, a 30 kw. rotary converter, and a 600 ampere-hour battery with a Turnbull-McLeod reversible booster-balancer, are also installed. (Page 649.)

Among the lawsuits during the Michaelmas term will be an action by Marconi's Wireless Telegraph Co. against the owners of the Balsillie system for infringement of patent. Another action will be in respect of the formation and subsequent liquidation of Messrs. Mountain, Gibson & Thornewill. The National Electric Construction Co. are appealing against the decision of the Kent County Court that an electric lighting Provisional Order does not entitle a local authority to enter into a "free wiring" agreement. Other appeals will be in respect of the Ilgner patent and the "Z" Co.'s metal filament lamp patents. (Page 650.)

An article describes some of the exhibits at a successful exhibition at Hampstead. (Page 650.)

The Acton Council have decided to transfer their electrical undertaking to the Metropolitan Electrical Supply Co.—The price to be paid by the Tramways Committee at Brighton for electrical energy is being inquired into by a sub-committee.—Hove ratepayers are protesting against the proposed introduction of tramways.—It has been decided to revise the charges for electricity supply at Leith in order to prevent large profits.—The Board of Trade have been referred to in connection with the proposed stoppage of the Scarborough tramways during the winter.—West Ham electricity accounts show a small loss for the past year, but rates have increased by over £5,000. (Page 652.)

The Manchester Corporation have placed an order for 8,000 yards of aluminium conductor.—Electrical extensions are proposed as follows:—Darlington (£1,400); Felixstowe (£3,000); Horsham (£1,850); Ipswich (£6,000); South Shields (£9,410); Tonbridge (£1,441); and Wednesbury (£4,000).—Twelve double-deck tramcars are required at West Ham.—Street lighting is to be carried out at Kettering and Frodingham.—A power station is to be erected at Bispham. (Page 652.)

At the half-yearly meeting of Messrs. Willans & Robinson, Ltd., it was suggested that the remedy for excessive competition in the manufacture of electrical machinery is amalgamation.—Norwich Tramways Co. show a net profit of £6,107 for the past year. (Page 654.)

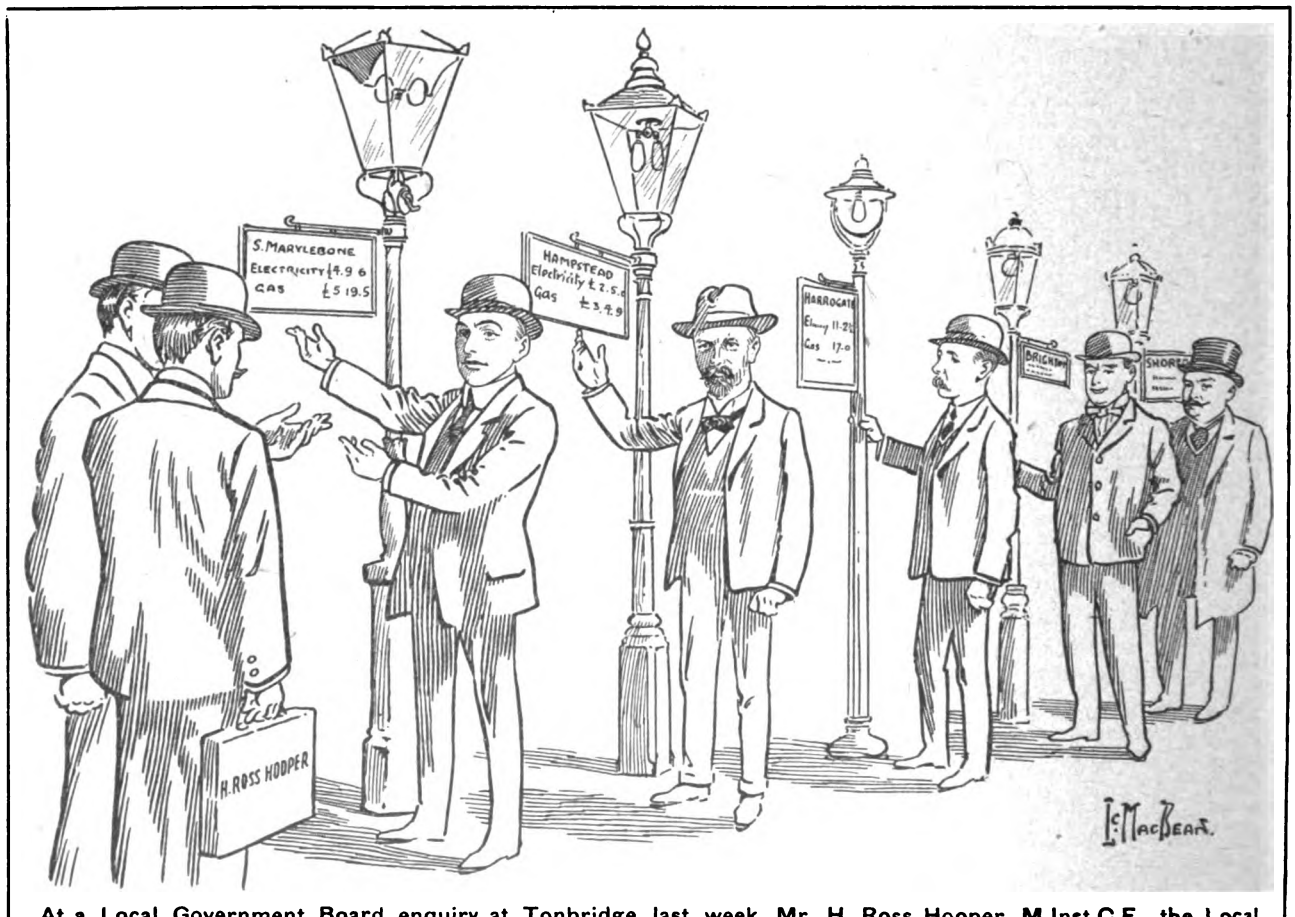
ARRANGEMENTS FOR THE WEEK

FRIDAY, OCTOBER 14TH.

Institution of Electrical Engineers: Manchester Local Section.

7.30 p.m. Conversazione at Whitworth Institute, Whitworth Park.

WEDNESDAY, OCTOBER 19TH.



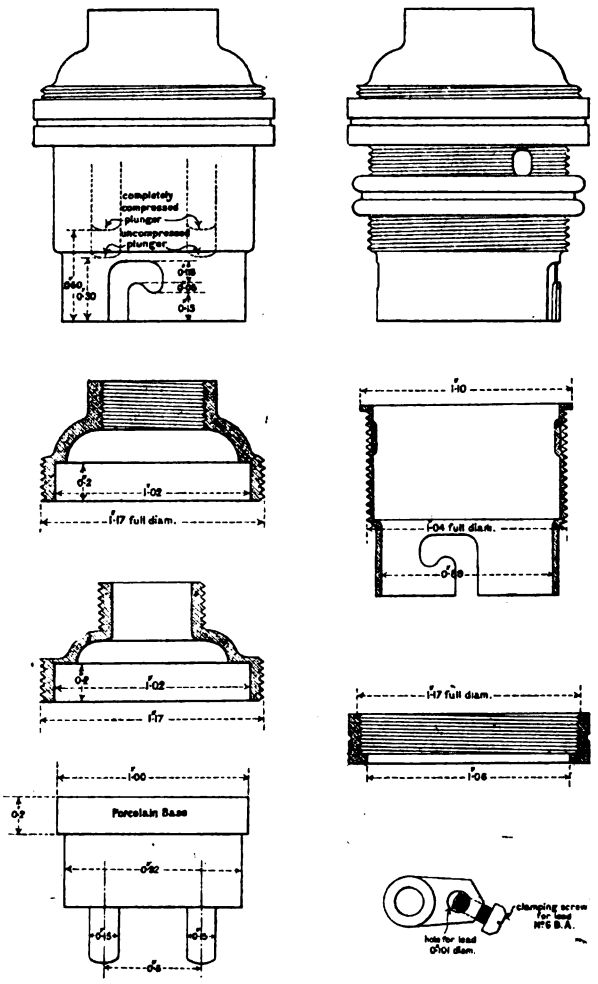
"Dynamicables."

7.30 p.m. Dinner at Trocadero Restaurant.

FRIDAY, OCTOBER 21ST.

Electro-Harmonic Society.

8 p.m. Smoking Concert at Holborn Restaurant (King's Hall).



At a Local Government Board enquiry at Tonbridge last week, Mr. H. Ross Hooper, M.Inst.C.E., the Local Government Board Inspector, asked whether there would be any saving to the ratepayers by substituting electric lamps for gas lamps for street lighting.

STANDARD LAMPHOLDERS

THE Engineering Standards Committee have now issued a standard specification for bayonet socket lampholders and caps, which has been drawn up by the sub-committee on Physical Standards, adopted by the sectional committee on Electrical Plant, and approved by the main committee. It is worthy of note that the actual committee responsible for the drafting of the specification includes two well-known station engineers and representatives of the Government departments. Only two of the members can in any way claim to represent manufacturing interests, and the firms with which these gentlemen are connected do not either of them, so far as we know, manufacture either incandescent lamps or lampholders.

BRITISH STANDARD LAMPHOLDER DIMENSIONS.
(*Full size.*)

BRITISH STANDARD LAMP CAP.
(*Full size.*)

The question of interchangeability of lamps and holders is of paramount importance, and the question is indeed an international one. No indication is, however, given in the report as to whether the standards agree with those in use in the other principal lamp-making countries.

The dimensions, angles, and relative positions of the metal parts of the standard lampholder and cap are defined in the specification, but some freedom is left as to the exact form and material of the insulator. These dimensions are shown in the drawing reproduced here. Very full particulars are also given of a series of gauges for testing manufactured lampholders with full drawings. We reproduce also a drawing showing dimensions of the standard lamp cap, which is in conformity with the British standard specification No. 33 for carbon filament lamps. A gauge for testing lamp caps is also described in the new specification.

The lampholders described are intended to be for voltages up to 250 volts, but no pronouncement has been made as to maximum current or watts for which they are suitable. It is stated that experiments in this direction are in progress.

The specification deals with holders for lighting purposes only, but it is understood that the effect of heat on the ordinary lampholder is being investigated experimentally at the National Physical Laboratory, so we may shortly expect to see an addendum to the present report, dealing with lampholders for use with radiators.

The price of the report is 5s. 2d. post free, and it may be obtained from any bookseller, or direct from the offices of the Committee, 28 Victoria Street, Westminster. It is published for the Committee by Messrs. Crosby, Lockwood & Son, 7 Stationers Hall Court, Ludgate Hill, E.C., and 121A Victoria Street, S.W.

THE DOLTER SYSTEM AT TORQUAY

MR. A. REED has now issued his award in the arbitration held recently to decide whether the Torquay Corporation had unreasonably withheld their consent to the introduction of the overhead system of electric traction on the Torbay Road. The proceedings were reported in our issues for September 15th, p. 595, and September 22nd, p. 609. It will be remembered that the Torquay Tramways Co. have decided to substitute the overhead system for the Dolter system throughout Torquay, a right which they claim they have under their Act of Parliament, but which is disputed by the Corporation. With regard to the Torbay Road, however, a special clause applied to this—hence the arbitration. The arbitrator finds that the Corporation have unreasonably withheld their consent, and awards the Company costs.

At the commencement of the arbitration proceedings it was contended on behalf of the Corporation that the Board of Trade had no power to appoint an arbitrator under the Company's Act of Parliament in respect of Torbay Road, and the proceedings went on under the protest of the Corporation. The whole question was discussed at the meeting of the Corporation on Friday, and according to the local papers it was referred back to the Tramways Committee, on the understanding that there are to be no further legal proceedings against the Company, and that an endeavour will be made to enter into an amicable arrangement with the Company for the benefit of the borough as a whole. Apparently the general feeling of the Council is in favour of accepting the award.

Robertson & Osram Works Conversazione.—On Saturday last the members of the Robertson & Osram Social and Athletic Club run by the employees of the Roberson & Osram Lamp Works, Brook Green, Hammersmith, held their annual conversazione and dance at the Works. There were some four hundred present, including guests among whom were Mr. Hugo Hirst (Managing Director, General Electric Co.), Mrs. and Miss Hirst, Mr. J. Fraser, Mr. and Mrs. C. Wilson (Brook Green Works), Mr. and Mrs. M. Railing (Manager, Witton Works), Dr. Railing (London), Mr. J. Spence (Newcastle), Mr. E. Wilson (Witton), Mr. Fletcher (London), Mr. L. Dunnere, and others. An excellent musical entertainment was provided, and the evening was a great success. Incidentally, we heard that the Osram Lamp Works will very shortly be extended to some 50 per cent. of its present size, the plans having already been passed. The output of Osram lamps manufactured at these works has now reached a figure of 60,000 per week, which, of course, is only a small fraction of the total number handled by the General Electric Co.

Telegraph Traffic.—The chief event during the past week has been the interference with telegraphic communication with Lisbon, due to the Revolution. Censorship has added to the delay of messages, which are still many hours in reaching London. The land lines are, however, being rapidly repaired, and, as the cables of the Eastern Telegraph Co. are uninjured, the usual order will soon reign. Code telegrams are still prohibited. The Spanish Government, on the 8th inst., stated that direct communication between Lisbon and Madrid had been reopened.

THE WIRING CONTRACTOR'S POINT OF VIEW

A PAPER by Mr. G. F. Ratcliff, Chairman of the London Section of the Electrical Contractors' Association, which is to be discussed at the November meeting of the Association, contains suggestions for raising the status and efficiency of that body. In the course of it the author frankly calls attention to the possibility of bad work being done by members. He suggests that all members should be "pledged" to a standard of work—say that defined in the Wiring Rules of the Institution of Electrical Engineers—and that consulting engineers, central station engineers, architects, and builders should be invited to report to the Association any "real or supposed default" on the part of any member. He also advocates that the Association should offer to have an installation inspected and reported on by a consulting engineer of repute at a fixed charge.

This suggestion is certainly worthy of consideration, but it appears to us that Mr. Ratcliff is setting to work at the wrong end of the job. It appears that he actually suspects the presence as members of the Association of unqualified men—"drapers, furnishers, builders"—who succumb to the temptation of carrying out work "with low-priced labour, poor materials, ignoring all rules, thereby bringing discredit on electrical contracting . . . not giving the public what they expect or require." We should be sorry if this is the case, but if Mr. Ratcliff's suspicions are well founded, the error lies in admitting such men to membership at all. If membership of the Association is to imply the equivalent of possession of a certificate of efficiency, this can only be effected by inquiries about the work and status of candidates before they are admitted, not by weeding out the undesirables gradually as their work is complained of. It is also open to question whether the Association is entitled by its rules to expel members for carrying out bad work. The whole subject bristles with difficulties, but the first step to be taken is to ensure that—whether there be already a certain number of black sheep among the members or not—no new members should be admitted without some sort of inquiry, or, better still, a guarantee by two or three old members of good standing. Difficulty would also be found in setting up a standard in accordance with any existing code of rules. For instance, if this standard were the Institution rules, what would be the position of firms who worked to specifications that did not follow these rules implicitly? Rule No. 83 specifies that switch lampholders must be controlled by a wall switch. Rule 45 specifies that the connection between flexibles and hard wires may only be effected by means of screw-down terminals. Rule 51 specifies that metal staples must not be used for fixing unarmoured conductors. Rule 57 specifies that the dielectric of conductors must not be bared back further than to allow the conductor to enter the terminal properly. Rule 60 specifies that conductors larger than 7/18 must be soldered to proper lugs for connection. Rule 76 specifies that wall and floor sockets must be independently controlled by a switch on the live side of the plug, and recommends that the portable fittings themselves should not be provided with switches. Finally, rules 94 and 95 specify that the case of each cell (of accumulators *or primary* batteries) must stand on insulators. All these are excellent rules; but if every member of the Association were asked to resign who could not conscientiously aver that he or his men had not contravened any of the above rules during the past twelve months, the Electrical Contractors' Association would dwindle down to a few members of the unemployed.

THE PORTUGUESE REVOLUTION

THE Revolution in Portugal has directed attention to wireless telegraphy in connection with its political value in a manner that has hardly been appreciated up to the present. The first message reporting the outbreak of the Revolution was only received by the aid of wireless telegraphy; and it is curious to note that this is the second occasion in which this particular system employed (the Telefunken system) has helped to make history. Owing to the fact that the land telegraph lines had been cut by the Republicans, the correspondent boarded the s.s. *Cap Blanco* of the Hamburg South American Line in the harbour at Lisbon, as this ship is fitted with a Telefunken wireless station, and transmitted the message in the following manner:—

The *Cap Blanco* had arrived at Lisbon during the night of October 4th and 5th on its return trip from Buenos Ayres. The wireless telegraph equipment is worked by officials of the Telefunken Company, who called up the sister s.s. *Ypiranga*, which was lying at Santander in the Bay of Biscay, and communicated to her the first news of the outbreak of the Revolution. The *Ypiranga* transmitted the news to Paris. In the meantime, however, other correspondents had arrived on the *Cap Blanco*, and the operator was asked to forward other messages to Berlin. For this purpose he was required by his instructions to call up the nearest wireless ship or coast station which it was possible for him to reach with his apparatus. Amongst the ships which, according to the time-tables at his disposal, appeared to be within reach of the ether waves of his apparatus, there were none which would reach any coast within a reasonable time. Hence, the operator attempted to communicate with the nearest land stations. These were either Algiers or St. Marie de la Mer, near Marseilles. The route to the former involved greater expense, so the operator attempted to call up the St Marie station about 10 times. This station is equipped with a receiving apparatus for specific wave-length. The operator on the *Cap Blanco*, therefore, gave the call which set the receiving apparatus at St. Marie in operation, whereupon St. Marie returned the call. The operator on the *Cap Blanco* then transmitted his message. As the waves spread in all directions, this message could also have been picked up at Algiers, but as the call signal given by the operator was the one belonging only to St. Marie, the Algiers station, in accordance with the International Agreement, could not accept it. The messages were retransmitted from St. Marie in the usual manner.

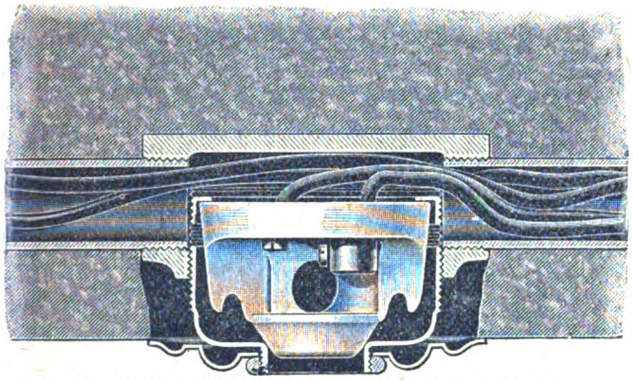
The performance of the wireless apparatus on the *Cap Blanco* must be characterised as quite exceptional, as the distance to St. Marie is about 850 miles, with fairly high mountains intervening. As the range of the apparatus is dependent on the height of the masts of the ship, and the *Cap Blanco* is not fitted with specially high masts, the performance of the Telefunken apparatus is all the more noteworthy. As a matter of fact, the oscillating energy of the apparatus is 1·5 kilowatts, and the masts are 32 and 41 metres high.

It is of interest to note that the Telefunken system is being developed at their Woolwich Works by Messrs. Siemens Brothers & Co., Ltd., to whom we are indebted for this information.

FINANCES OF THE NEWPORT ELECTRICITY DEPARTMENT

THE Newport Ratepayers' Association have taken up the position of the Newport electricity undertaking in the light of the recent decision regarding the West Ham Electricity Department, in which it was declared that the borrowing of money from a bank to meet the temporary wants of municipal electricity departments and the payment of interest thereon is illegal. Messrs. Elvy Robb & Welch, the solicitors who had the West Ham case in hand on behalf of the India Rubber, Gutta Percha, & Telegraph Works Co., Ltd. have been consulted in the Newport case, and they have requested the Corporation to give an undertaking that any interest paid upon loans from the bank in respect of the electricity revenue account should be refunded at once, and that no further sums should be paid for interest in this way. They further ask that the Corporation will not make or enforce any rate for the purpose of paying off the bank overdrafts or interest thereon, and also that no rate shall be enforced for paying off the sum of £3,500 standing to the debit of the electricity capital account.

The Electricity Committee state that the question is receiving their serious consideration, but they do not intend to avoid any of their just liabilities in the matter. The levying of a rate to meet the sum of £3,500 was made at the express request of the Local Government Board. It is recognised that the decision in the West Ham case involves a serious charge in the relations between the Corporation and their bankers.



The Trackless Trolley in America.—The *Electric Railway Journal* describes a trackless trolley line that has been constructed near Los Angeles. The cars accommodate 16 passengers, and each is equipped with two 15 h.p. motors. Two separate trolley poles are used, supported on standards on the roof of the car. The poles permit of a lateral range of 11 ft. on either side for passing vehicles.

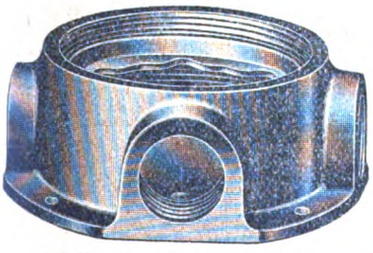
NEW ELECTRICAL SUPPLIES AND ACCESSORIES

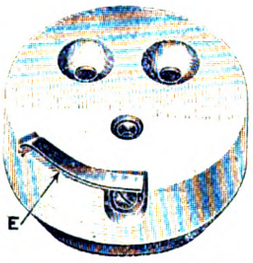
Switches and Accessories.

In addition to the materials for their well-known "Kalkos" system of wiring, the Sun Electrical Co. (118–120 Charing Cross Road) have put on the market a series of accessories for ordinary screwed tube work, which include an iron box with several interesting features and a new watertight switch. The malleable iron box, which can have various arrangements of outlets, is shown in the figure, which also shows the adjustment ring upon which the porcelain base of the switch ceiling rose or other accessory rests. The object of this is to obtain an adjustment of the level of the switch after the wall is finished, to allow for variations in the thickness of the plaster. It is shown in use in the top figure. A large variety of covers are made which screw into the body of the box. The special watertight switch made for this system is also illustrated. The cover is coned to fit watertight over the collar round the dolly, and the latter is further packed by a packing ring P, making a gland joint when the collar C is pressed on. Another important feature of the switch is the way in which the moving current carrying parts are enclosed in marmorite, so that it is impossible to draw out an arc between a terminal and earth. The earthing of the dolly is also complete and automatic without making extra connections. The switch, which is particularly compact for a watertight switch, can be used either with the "Kalkos" or the screwed tube system. Attention may also be drawn to the three-pin plug in this new series of accessories, the socket of which is provided with a spring earth contact E, which makes contact with the adjusting ring immediately the socket is dropped into the box.

"Sun" Adjustable Box as supplied to Flush Ceiling Rose.



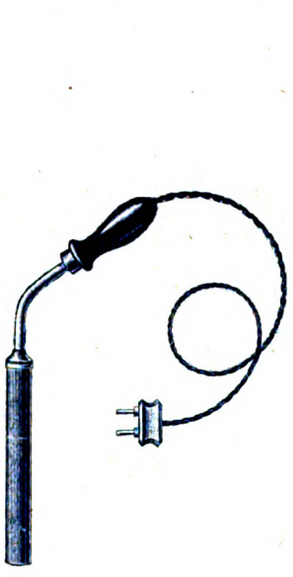
Body of Watertight Switch.



Detail of Packing of Dolly.

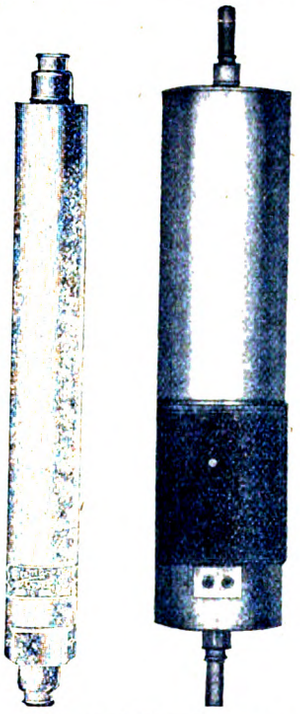
Adjusting Ring.

Malleable Three-way Box.



Three-pin Wall Plug, with Earthing Device.

New Fittings for Screwed Tube System. (Sun Electrical Co., Ltd.)

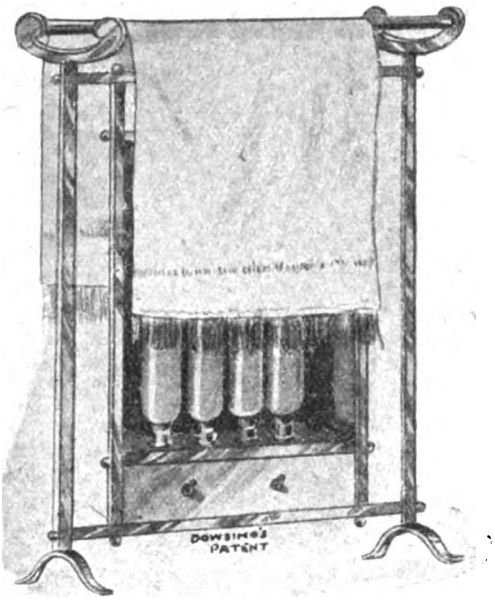


A further novel advertising device has been introduced by Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), in the form of opal shades, on which are sand-blasted the words "Tantalum lamps." These will be supplied to contractors free of charge, and are known to the trade as Shadolite "Tantalum" reflectors. These specialities are offered in conjunction with the main advertising scheme mentioned in a previous issue. Shadolite "Tantalum" shades are lettered on the inner surface for interior lighting, but for outside lighting they are supplied lettered on the upper surface, and form a most effective advertisement.

Heating and Cooking Apparatus.

The Armorduct Manufacturing Co., Ltd. (Farringdon Avenue, London, E.C.) have recently introduced several novelties on the "Therma" system. The heating element in these devices consists of a spiral or zig-zag of a special nickel-steel alloy strip of very high resistance, which is plated with a non-oxidising metal. The strip elements are laid between sheet mica, or wound on earthenware slabs or cylinders. One of our illustrations shows a heating stick for warming up any liquid in a glass or jug. It consists of a nickel-plated tube containing the heating element, and provided with a handle and connecting leads. It will boil a pint of water in from 14 to 16 minutes, and consumes only 200 watts. A simple water-heater for placing "in series" with the ordinary water-pipe is also illustrated. This consists of a straight metal tube surrounded by a heating element. The smaller size takes 1,000 watts, and by letting the water run through slowly will heat 2¼ gallons to 120° Fahr. in 30 minutes. A 5,000-watt size will bring 11 gallons to the same temperature in the same time. The third illustration shows an automatic device called the "Auto-cistern," for providing a constant supply of hot water at about 160° Fahr. When the water in the cylinder has reached this temperature, the heating element is cut out automatically with the exception of a small heater consuming between 50 and 100 watts, to keep the water hot. When hot water is drawn off, cold water enters, and the heater is switched in automatically. The cylinder has a double copper case to reduce the loss by radiation. Various sizes of these are made, and particulars will be furnished on application to the

"Therma" Glass or Jug Heater.

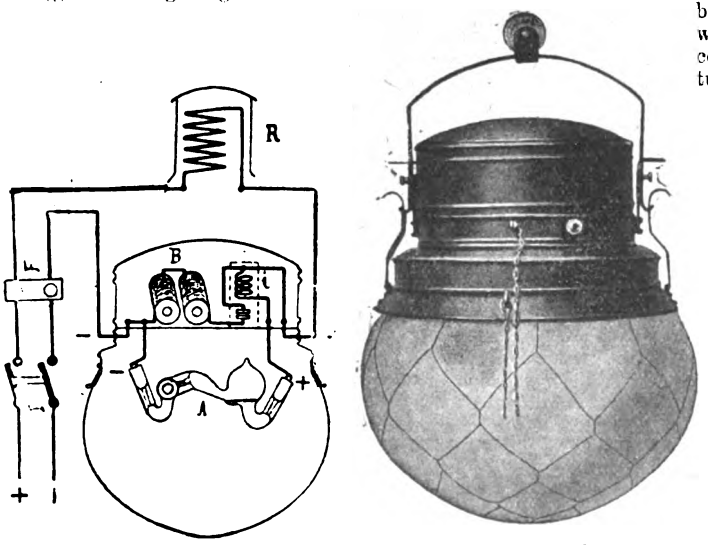


"Therma" Water Heaters.

Digitized by Google

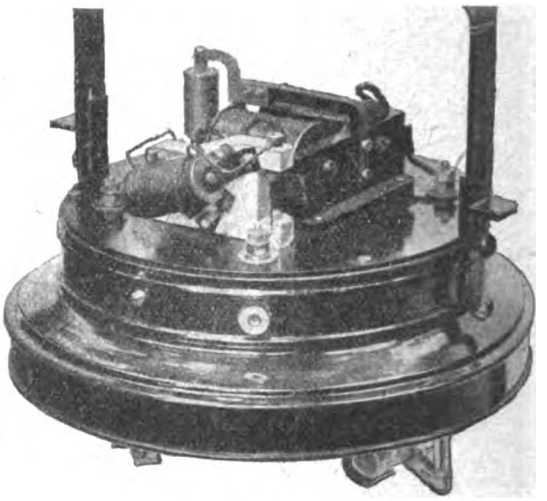
Amorduct Co. A large variety of electric kettles, hot-water jugs, egg-boilers, hot-plates, and other domestic appliances are listed in a new list issued by the company, and a line of electric cookers and ovens will shortly be placed on the market.

Among the novelties for the coming season introduced by the Dowsing Radiant Heat Co., Ltd. (24 Budge Row, Cannon Street, London, E.C.), is a useful luminous radiator for bed- and dressing-rooms, bathrooms, &c. As shown in the illustration, the radiator is supported on a polished-brass frame in the form of a towel rack, and can be used for airing



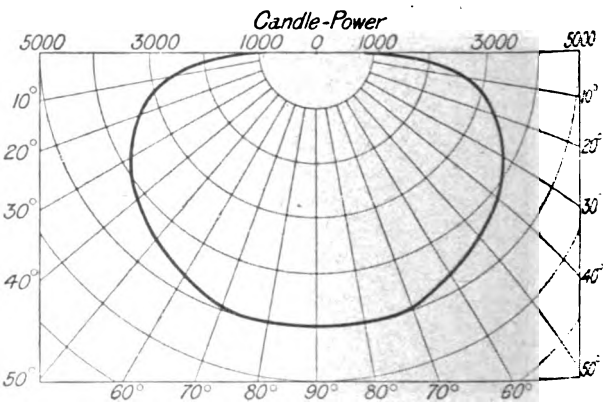
Radiator for Airing Clothes, Drying Towels, &c.

linen, drying clothes, &c., besides giving the luxury of warm towels in the winter and keeping them dry. The radiator consumes one unit per hour, and is thus also sufficient to heat quite a large room. It comprises four heat lamps controlled by two switches. The dimensions of the whole are 29 in. by 22 in., and the price is only a few shillings more than that of an ordinary radiator.



Lamps.

A quartz-tube mercury-vapour lamp has been introduced by the Westinghouse Cooper Hewitt Co., Ltd. (151 Great Saffron Hill, Holborn Circus, London), for direct connection for general lighting on 200-250-volt continuous-current



Connections and Exterior View of Silica Lamp.

circuits. The use of quartz instead of glass enables the tube to be only a few inches long, whereas a glass lamp for the same pressure would have to be several feet in length, as with a short arc a very high temperature is reached. As shown in the illustrations, the lamp is similar in appearance to an arc lamp, but neater and shorter, and is especially adapted for the lighting of large and lofty shops, factories, yards, &c. The lamp consists of a quartz tube *A* of a special shape, exhausted to a high degree of vacuum, and containing mercury at each end. The luminous portion in the smaller capacity lamps (1,200 hemispherical candle-power, 4 amperes, 100–130 volts) is about 1¾ in., and in the larger (3,000 hemispherical candle-power, 3½ amperes, 200–240 volts) about 4 in. The tube is mounted within the globe on the underside of the base, and is arranged that it can be tilted so that the mercury may be free to run to and from each end to strike the arc. A solenoid *B*, whose plunger is connected to one end of the quartz tube, and an automatic cut-out *i*, are mounted on the top of the base. The clear or opal globe is metal-flanged and arranged to fit securely on the underside of the totally

Tilting Mechanism of Silica Lamp.

enclosed metal case. It lowers at will to the extent of the length of the chains, leaving the inside open for inspection, &c. An external resistance *R* is mounted in any convenient place. The action is as follows:—On putting the lamp in circuit, the current passes from the positive main through the resistance *R*, the cut-out *i*, and the solenoid *B*, back to the negative main. The solenoid causes the positive end of the tube to be lifted, and the mercury to flow along the tube to the opposite end, thereby completing the tube circuit. As the cut-out coil is in series with the tube, this now comes into operation, and immediately breaks the solenoid circuit. The quartz tube then falls back to its original position, and continues alight until the lamp is switched off. The vapourised mercury alone constitutes the conducting medium in the tube, and is the sole source of light, there being a continual process of vapourisation and condensation whenever the lamp is alight. As it is essential that the correct polarity should be observed to prevent damaging the tube, means are provided in the lamp itself which automatically ensure this, and with reversed connections the lamp will fail to light up.

Light Distribution Curve of Silica Lamp.

The Silica lamp is claimed to emit a light of uniform quality with no flickering, and very little attention is required. No fumes are given off, and consequently no troubles with corrosion are possible. The distribution curve

Digitized by Google

shows an even illumination in all directions, and owing to the length of the arc, no sharp shadows are produced. The curve is for a 220-volt lamp taking 3·64 amperes. The mean hemispherical intensity is 3,630 c.p., which corresponds to a specific consumption of 0·22 watt per mean hemispherical candle-power. A 100–130-volt lamp takes 4 amperes, and has a mean hemispherical candle-power of 1,200. This size is usually suspended at a height of from 20 to 30 ft., and the larger lamp at from 30 to 50 ft. above the floor-level. The quartz tube has a guaranteed minimum life of 1,000 hours, and is said usually to last about 2,000 hours. A total running cost for a 250-volt lamp is stated to be under 1d. per hour, with current at 1d. per unit.

The Westinghouse Cooper Hewitt Co. have also introduced a water-steriliser, in which the essential part is the above-described quartz lamp, the ultra-violet rays from which are utilised to destroy any bacteria which may be present in the water. The tube is fixed in the inside of a metal case, and is tilted for striking the arc by hand. A shallow basin is supported immediately under the lamp, and the water is caused to flow up into it, and circulate under the rays round a system of cones before leaving. The consumption of the device is 4 amperes on 220–250-volt circuits (direct-current), and a maximum-delivery of 130 gallons per hour is obtained. Tests on these sterilisers by Dr. Roux, of the Pasteur Institute, Paris, have shown that the rays of the lamp are effective whether oxygen is present or not, and that all the more frequent types of bacilli were destroyed in exposures of from 10 to 60 seconds, which length of time is ensured by the circulating arrangements. As the ultra-violet rays are harmful to the eyes, and to some extent to the skin, the quartz tube in either this device or the lamp described above must not be looked at *closely*, but the absorption of the dangerous rays by the glass outer globe and the atmosphere is so great that there is absolutely no danger of harm from the use of the lamp as an illuminant.

The Brush Electrical Engineering Co., Ltd. (1 Kingsway, London, W.C.) have introduced an entirely new design of quartz mercury vapour lamp for general illumination, embodying several novel features. One is that the use of a quartz tube in place of glass renders it possible to construct a tube only a few inches in length, suitable for running direct on 250-volt continuous-current circuits. The lamp itself consists of a simple straight tube of quartz about ¾ in. diameter and 6 ins. long. During working the tube is inclined downwards slightly towards the negative end, which terminates in a large bulb filled with mercury. At the positive end is a tantalum button about ⅜ in. diameter, the stem of which dips into a second, but smaller, bulb of mercury. When the lamp is switched on, the tilting mechanism causes mercury to run along the tube from one end to the other, and start the arc, which then plays between the tantalum button at one end and the surface of the mercury at the other. As the button is raised to a bright red heat, it furnishes a certain amount of red rays, but the light has still the weird colour of the ordinary mercury arc. But the fact that the arc does not play from the mercury at the positive end appears to give more important advantages than this, in that no mercury is carried by the arc along the tube, and the character of the arc is modified to some extent. The mercury at the positive end is kept comparatively cool and vaporisation goes on chiefly at the other end. Owing to the large quantity of mercury at the negative end, the heat is rapidly radiated, and no special radiating surfaces are required. An aluminium reflector is placed above the lamp. The mechanism comprises a shunt tilting magnet, and a coil in series with the tube, to cut out the shunt magnet when the arc is struck. This mechanism is enclosed with the necessary series resistances in the metal case. The large opalescent globe diffuses the light and absorbs the harmful ultra-violet rays. These rays act on the air in the globe and cause the formation of ozone, and as there is a continual circulation of air through the globe, the atmosphere of a room in which a Quartzlite lamp is working is continually purified. The rays themselves are also destructive to bacterial life.

BRUSH "QUARTZLITE."

The Quartzlite lamp is particularly adapted for textile mills, warehouses, workshops, railway yards, docks, &c. but, as yet, the colour is hardly suitable for ordinary interior house or shop lighting. At present it is made in two sizes, 1,800 c.p. and 3,000 c.p., for 100 and 250-volt circuits respectively, the consumption being 360 and 875 watts respectively. Including the cost of renewal (the lamp tube lasts some 2,000 hours), the total costs per hour with current at 1d. per unit are 0·51d. and 1·025d. respectively. We understand that a 10,000 c.p. lamp is being developed, and that small lamps with colour rectifying devices are being experimented with.

Other new fittings and accessories are mentioned in our article on the Hampstead Exhibition on p. 650.

CORRESPONDENCE

DIESEL ENGINES.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—With reference to the paragraph in your issue of September 29th last, in which Messrs. Willans & Robinson, Ltd., of Rugby, advertise the fact that they have been for five years manufacturers of Diesel engines for the Diesel Engine Co., we beg to state that this firm has only manufactured a very small proportion of our orders, viz., 28 engines in all, over a period of five years, and that it was at our instigation that the contract was terminated.

As holders of the original Diesel Patents in this country, the Diesel Engine Co. have an exceptional advantage, and are able to offer a very large range of sizes and types of Diesel engines, both for marine and stationary purposes, from 5 h.p. up to 4,000 h.p., in four-stroke and two-stroke engines, also slow-speed and high-speed, the design of which has been the outcome of years of experience.

179 Qn. Victoria St., London, E.C., October 5th, 1910.

Yours faithfully,
DIESEL ENGINE CO., LTD.,
W. T. BATHO, Manager.

ANSWERS TO CORRESPONDENTS

Correspondents must in all cases send their names and addresses with their queries, and, if they do not desire the reply to be published after their own name, should add a "nom de plume." Questions should be addressed to The Editor, ELECTRICAL ENGINEERING, 203-6 Temple Chambers, Temple Avenue, London, E.C. The Editor will not guarantee to answer all questions in this column, and the enclosure of a stamped and addressed envelope is therefore desirable. Books recommended will be forwarded on receipt of a remittance for the amount mentioned.

BERT.—The motor you mention is rather large for the ordinary lever type starter. You could, however, use a multiple switch type starter, such as is made by the Adams Manufacturing Co., of Bedford, as these ensure the motor starting up slowly while the switches are closed in succession. They can be fitted with no-voltage and overload releases. Motor starters of the drum type resembling controllers, with some excellent features, are also made for motors of large size by Messrs. A. Reyrolle & Co., Hebburn-on-Tyne.

CHARLES LAMB.—Your friend will find what he wants on pages 34 and 210 of "The Electrician" Wireman's, Mains Superintendent's, and Linesman's Pocket Book (post free 5s. 3d.). This includes diagrams of connections for three-phase motors, and formulæ for the calculation of current for different h.p. power factors and voltages, and also conductor tables giving the current-carrying capacity of conductors and the voltage drop.

COUNTRY HOUSE LIGHTING

THE General Electric Co. have just issued a Bulletin (No. 4 of their series) dealing with the subject of country house lighting with self-contained generating plant; a system to which great impetus has been given by the introduction of low voltage metal filament lamps, which, owing to their economy in current consumption, have considerably reduced the size of the plant required. Useful information is given regarding the arrangement of the plant, and every portion of the equipment required is listed in a convenient way.

The generating plant consists of single cylinder paraffin engines directly coupled to 25 or 50 volt continuous-current dynamos, and they are listed from 1·5 h.p. for 40 10-c.p. lamps to 12 h.p. for 720 10-c.p. lamps, or an equivalent number of lamps of larger size. Complete switch panels are standardised for each size, and prices are given for complete 14- or 28-cell storage batteries. A few representative designs of fittings are included in the list, and the possibility of using the electrical supply for ventilation as well as lighting is provided for by electric punkahs and fans.

Municipal Wiring Bill.—Stretford has promised financial support. Handsworth and Clacton-on-Sea will give moral support, but Crewe has decided to take no action.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published October 6th, 1910

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

18,636/09. **Battery Plant.** A. M. Taylor (King's Heath). In order to reduce the cost and increase the efficiency of battery plant, arrangements are made for connecting two or more booster armature windings in series and in parallel, and an auxiliary or "bucking" booster is employed during charging with the object of increasing the number of cells in the battery and reducing the output of the main boosters. Instead of a bucking booster, a number of additional cells may be employed in conjunction with suitable switchgear. This enables the battery to float on, or discharge lightly into, the main 'bus-bars, without the boosters. Two figures.

20,869/09. **Voltage Regulator.** W. J. Walters (Rugby). An automatic apparatus for regulating the voltage of an alternator is described. It consists of two windings supplied from the two sources which are to be kept at equal pressure, and acting on a disc or armature which works a variable resistance in the field circuit of the alternator exciter. When the pressure of the machine varies from the normal, the disc is rotated and the voltage corrected. Five figures.

21,008/09. **Arc Lamp.** L. D. Cibie (Paris). This is a flame arc lamp of the supported carbon pattern. The negative carbon is vertical and central, and is held and guided in a socket having a spherical bearing in the base plate of the lamp. Attached to this socket is a stop on which the carbon rests, and after each feed, the socket swings slightly and wedges the carbon. The positive carbon is only very slightly inclined to the negative, and is swung for striking and regulating by means of a lever. Eight figures.

21,219/09. **Train-Lighting System.** W. F. Anderson, S. A. Russell, and W. E. Gray (India Rubber, Gutta Percha, & Telegraph Works Co., Ltd.). This is a two-battery system, in which current can be supplied to the load by both batteries when the dynamo is running below a certain speed. Above this speed, the load is supplied and one battery charged simultaneously. A current proportional to the charging current passes through a demagnetising winding on the field magnets of the dynamo to prevent charging at an excessive rate. When the load circuit is open the two batteries are charged in parallel. Automatic change-over switches for use in this system are described. Six figures.

21,369/09. **Radiation Pyrometers.** Cambridge Scientific Instrument Co., Ltd., and R. S. Whipple. A pyrometer for measuring very high temperatures comprises a closed tube with a thermo-electric element at one end. The other end is subjected to the temperature to be measured, and the heat is radiated down the tube to the sensitive element. Means for increasing or reducing the proportion of heat radiated on to the element are described. Four figures.

22,287/09. **Cheap Wiring Cable.** J. S. Highfield (London). This specification relates to the manufacture of wiring cable comprising a flat strip of insulating material with the conductors embedded in the two edges. The two wires are passed parallel to each other through a die, which may be rectangular or consist of two circular openings connected by a narrow slot. A rubber or other insulating compound is squirted on to the wires so that it forms a coating round the wires of the shape of the die. The strip thus formed is covered longitudinally with tape, or braided. A final coating of insulating compound is given to produce a smooth surface. Two figures.

22,878/09. **Telegraph Insulator.** J. Ball and C. F. Readman (Hanley). A pole insulator for telegraph and telephone lines consists of two porcelain cups fitting one over the other, and supported by means of a collar on the iron pin. A metal cap coated with enamel screws on to the pin, and the cups are clamped between this cap and the collar of the pin. One figure.

25,278/09. **H.-T. Switchgear.** H. R. Schultz and F. B. Holt (Manchester). In an enclosed iron-clad H.-T. oil switch, the overload tripping coil and an ammeter are mounted directly upon the H.-T. conductor to which they are electrically connected. The trip mechanism is placed in a separate casing on one side of the main switch box, and is entirely isolated from the live parts, so that it can be inspected or adjusted while the switch is closed. One figure.

25,449/09. **Cable Clamp.** W. T. Henley's Telegraph Works Co., Ltd., and S. H. Penning. A clamp for connecting a conductor to any one core of a multiple-core cable without removing the insulation consists of a divided metal ring which clamps round the insulated cable, and which is provided with radial tapped holes. A set-screw passed through one of these holes into one core of the cable holds the ring in place and connects it electrically with the one core. A socket terminal on the branch conductor is screwed to the ring by a second set-screw. Two figures.

1,145/10. **Carbon Brushes.** W. A. Stevens, Ltd., W. A. Stevens and A. T. Lambert (Maidstone). In order that a carbon brush may be readily held away from the commutator when holders of the box type are employed, a notch or recess is made on the surface of the carbon facing the finger lever. When the carbon is lifted up, the point of the finger lever drops into this notch and holds the carbon up. Other means of obtaining the same end are described. Nine figures.

8,410/10. **Armature Windings.** Siemens Bros. Dynamo Works, Ltd. (*Siemens-Schuckertwerke Ges.*). Overcrowding at the bends in composite armature coils is avoided by making the inner conductor change to an outer conductor at the commutator end of the coil only, the bend at the other end being merely a kink to change the level of the top and bottom halves of the coil in the usual manner. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Dynamos, Motors, and Transformers: William Beardmore & Co and Sykes [Automatic control of reversal of electrically-driven machine tools] 21,803/09; Barker (*Welch and Parkman*) [Motor control] 25,205/09; Siemens Bros. Dynamo Works (*Siemens Schuckertwerke Ges.*) [Regulation of frequency transformers] 4,263/10; A.-G. Brown, Boveri & Cie. [Train-lighting dynamo] 11,024/10; Allgemeine Elektricitäts Ges. [Machines] 14,125/10; Meirowsky [Insulation of armatures] 14,961/10.

Electric Ignition: Royer, 21,191/09.

Electrometallurgy and Electrochemistry: Hartmann [Electrical process for the purification of liquids] 1,459/10 and 1,460/10; Härdén [Furnaces] 3,739/10.

Storage Batteries: Luckow [Regenerating cells] 29,706/09.

Switchgear, Fuses, and Fittings: Heap [A.-C. switches] 21,357/09; Ellison [Time-lag devices for circuit-breakers] 24,115/09; Myer [Metal wiring conduit] 25,822/09; Hunt (*Swan*) [Ceiling fans] 28,333/09; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Control of electrically-operated switches] 1,146/10; Lundberg [Switches] 8,080/10; Kohler [A.-C. solenoids for electrically-operated controllers] 15,417/10.

Telephony and Telegraphy: Anderson and Anderson [Photo-telegraphic apparatus] 30,188/09.

Traction: Th. Goldschmidt [Welding rail joints] 21,750/09; Rietsch [Interlocking points and signals] 730/10; Grimme [Rail-joints] 8,340/10.

Miscellaneous: Pearce and Evershed & Vignoles, Ltd. [Acoustic apparatus] 21,394/09; Metal Jointing Co. and Harden [Lead joints] 27,482/09; Bambridge [Flexible shafts] 29,740/09; Anderson, Boyes & Co. [Coal-cutters] 29,762/09; Rietkötter and Kühn [Magnetic separator] 5,684/10; Davies [Advertising signs] 12,693/10.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Miscellaneous: Schuh [Driving of submarine boats] 17,962/10; Soc. Anon. Ateliers H. Cuénod [Automatic electric regulators] 20,957/10.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Distribution Systems, &c.: G. E. Heyl-Dia [Rubber and bitumen insulated cables] 11,217/00.

Dynamos, &c.: H. Leitner and R. N. Lucas [Train-lighting dynamos] 14,202/02; C. A. Parsons [Cooling of armatures] 13,108/05.

Heating and Cooking: H. S. Riddle [Electrically heated vulcanising apparatus] 13,969/04; W. Taylor [Therapeutic air heater] 12,807/05.

Storage Batteries: H. Leitner [Formation of Planté plates] 14,128/04.

Switchgear, &c.: Stothert & Pitt and P. K. Stothert [Electric crane gear] 12,835/01; J. W. Mackenzie (*C. K. Manufacturing Co., U.S.A.*) [Flush wall and floor plugs] 14,342/02; G. M. Pinkerton [Magazine fuse-box] 13,984/04; A. J. Boult (*W. O. Duntley, U.S.A.*) [Push-buttons switch for portable drills] 13,093B/05.

Traction: E. von Planta [Sanding gear] 25,217/04.

Miscellaneous: L. Daft and A. Williams [Electrical detection of metallic ores] 14,124/02; E. Guess [Electrical cash checking machines] 14,062/03; W. C. Mitchell [Reversing gear for planing machines] 1,839/04; A. J. Boult (*W. O. Duntley, U.S.A.*) [Electric portable drills] 13,093-3A-3B/05.

PRICE OF ELECTRICITY FOR TRAMWAY PURPOSES

An arbitration was commenced in London on Friday to determine the price which the Paisley District Tramways Co. shall pay the Corporation for electrical energy. Mr. Robert Hammond is acting as arbitrator, whilst Mr. H. F. Parshall and Mr. W. M. Mordey appear as chief witnesses for the Company and Corporation respectively. The general complaint of the company is that whereas when the tramways first started some four years ago, the price for tramway energy was considerably lower than that for lighting and power, the reductions made in the latter, which it is contended have only been made possible by the tramway load, now leave the price for tramway energy the highest. The Company take about 1,300,000 units per annum, at an average price of 1·4d. per unit. In respect of a certain section of their lines, the Clyde Valley Electric Power Co. supply at 0·78d. per unit, and offer, if it were legally possible, to supply at a similar price for the whole undertaking. The case against the Corporation includes allegations that high salaries and the payment of too high a price for coal, tend to keep up the price charged to the Company. Further, according to some average figures put in, the rating of the undertaking would appear to be excessive, according to the Company's witnesses. In repudiating a suggestion that the Company have not laid a sufficient feeder system for dealing with the tramways, it was pointed out that there are 2½ square inches of copper on the positive side, and 2 inches on the negative side for a load of 600 kw. The case for the Company was concluded on Saturday and the proceedings were adjourned. Mr. D. A. Slain, General Manager of the Clyde Valley Electric Power Co., and Mr. F. E. Gripper, of Edmundson's Electricity Corporation, were among the Company's witnesses. Mr. Hammond will visit Paisley in connection with the arbitration next week.

NORTHAMPTON POLYTECHNIC INSTITUTE
New Generating Station

The latest addition to the engineering equipment of the Northampton Polytechnic Institute, Clerkenwell, London, is a very complete generating station, which has been installed at a cost of about £6,000. It was formally opened yesterday afternoon by the Chairman of the London County Council, but has been supplying the lighting and power of the building for some weeks. The station is situated in the basement of the north-east corner of the main building, but is excellently lighted and ventilated.

The generating plant comprises two six-cylinder Gardner gas engines, rated at 108 b.h.p., 500 r.p.m., and each coupled to two Siemens generators in tandem. Two gas producers are installed in a yard adjacent to the engine-room, and either engine can be run off either producer. The two producers can work together to supply one or both engines, and for this purpose a mixing chamber is being erected. Provision is also made for working one or both engines off the town gas supply. One of the two generators on each engine is a 50 kw. 220 volt, D.C. machine, and the other is a 50 K.V.A., three-phase, 2,200-volt, 25-cycle alternator. There is nothing unusual about these machines except that the terminals of the alternator stator winding are made readily accessible, and provision is made for star or mesh connection. A small motor is installed with change-over belt gear for driving either the air-compressor for starting the engines, or a centrifugal fan, which draws air down outer pipes surrounding the exhaust pipes, and from other parts of the engine-room, to keep the atmosphere cool and fresh.

In the engine-room are also a motor-generator set and a battery booster-balancer. The former consists of a 45 b.h.p., three-phase, 2,200-volt synchronous motor, coupled to an 110-volt, 27½ kw., D.C. generator on one side, and a 220-volt, 25 kw., D.C. generator on the other. The latter is used for starting the set up from the D.C. 'bus-bars. A three-motor, three-ton travelling crane is provided. In an adjacent room is a group of four 13·7 kw. single-phase transformers, three connected in mesh, and one spare, transforming down from 2,200 volts to 350 volts. A 30 kw. rotary-converter, supplying at 550 volt on the D.C. side, is also in this room. The battery is in an adjacent corridor, and consists of 106 D.P. cells of 600 ampere-hours capacity on the 10-hour basis. This will deliver a current of 200 amperes at 220 volts for one hour. The booster-balancer working in conjunction with this is of the Turnbull-McLeod reversible pattern, and was also supplied by the D.P. Battery Co.

At the end of the engine-room, adjacent to the converter and transformer room, is a gallery for the control of the H.T. switchgear. The oil-switches themselves are in the room with the transformers, and are arranged with these in chambers fronted with expanded metal. They are operated by levers on the gallery, which, with all the instruments, relays, &c., are fitted to a board of the desk pattern. The only H.T. apparatus on the gallery is a leakage indicator, all the instrument and relay transformers being below in the switch chambers. The desk board comprises two generator panels, the synchronous motor panel, and the transformer panel. Ammeters, three-phase power-factor indicators (for unbalanced loads), and meters are provided on each panel, and there is also a synchronising device and a frequency meter. The two main switches for the generators are fitted with Ferranti reverse current relays. On the same gallery is a L.T. board, comprising the A.C. control panel for the rotary-converter, and two three-phase feeder panels for experimental power circuits. Provision is made for starting up the rotary-converter on the A.-C. side by paralleling and short-circuiting all the field coils, and supplying the armature with current at 60 volts alternating. When the machine is up to speed, the pressure is raised to the full 350 volts, and the field coils changed over to series connection preparatory to synchronising. The eddy-currents in the damping coils are sufficient to keep the machine running when once up to speed. Another feature of this machine is the provision of three auxiliary transformers with the secondaries in series with the A.C. side, and means for reversing the primaries to add or subtract a small pressure in a number of steps.

The main feeder board is at the opposite end of the room, and includes six 220-volt, three-wire feeder panels, the first two of which supply the main distribution board for the lighting and non-experimental power of the whole building. This is a new board, which has been erected in the old engine-room. The other panels of the main feeder board are the 550-volt D.C. rotary panel, and the 550-volt and 110-volt feeder panels. Instruments and meters are provided on each panel. Above this board is a gallery with panels for the control of the D.C. generators, the D.C. machines of the motor-generator set, the booster-balancer, and the battery.

The wiring of the building is being partly re-arranged and adapted to the three-wire system. All the experimental circuits are kept entirely separate from all other circuits. The main feeders are rubber-covered cables run along the walls of the corridors with cleats. Connection between the machines in the engine-rooms and the switchgear is made by means of lead-covered, paper-insulated cables, but there are no H.T. circuits outside the engine-rooms. Advanced students will carry out experimental work in the engine-rooms, and will take shifts. Generation at high-tension was chosen purely for the purpose of giving the students experience in the handling of high-tension machinery and switchgear. The contractors for the whole station were Messrs. Siemens Bros. Dynamo Works, Ltd. The machines and switchgear are of this firm's make, but there are recording instruments by Elliott Bros., power-factor indicators, frequency, and other meters, by Everett & Edgecumbe, and relays by Ferranti.

Swiss Railway Electrification.—The Rhaetian Railway Co., owning several narrow-gauge lines in the east of Switzerland, has decided to equip three sections of its system for electric traction on the single-phase system with 10,000 volts trolley line pressure and a frequency of 15 cycles. The sections are the Engadine lines Bevers-St. Moritz, Samaden-Pontresina, and Bevers-Schuls. The last named is now being constructed, and will be opened in the summer of 1913, from which date all three sections will be worked electrically. A contract has been entered into with the Brusio Power Station for the supply of current for a given period. The working of these sections will serve as an experiment with a view to the more extensive adoption of electric traction by the company.

Electrification of Victorian Railways.—In the Victorian Legislative Assembly last month, a member referred to the inconvenience due to the increasing traffic on the suburban railways of Melbourne, and urged the Government to introduce electric traction instead of proceeding to double the track as had been suggested. In reply, the Premier stated that the structural alterations to the track now being carried out would be of use if electric traction were introduced. Electrification alone, he thought, would not give immediate relief, but he had no doubt that the system would be eventually electrified. The Government did not propose to appoint a Commission to inquire into the question, as they considered they had sufficient information in Mr. Merz's report. The Premier assured the Assembly that the Government were fully alive to the importance of the question, and would shortly appoint a competent person to inquire further into the matter. Mr. E. C. Warde, a member of the Assembly, referring to the fact that the Railway Commissioners rejected Mr. Merz's proposal on the ground that it would require an increase of traffic of 33 per cent. to justify electrification, stated that in the intervening three years the traffic had increased on some lines by 100 per cent., while the average for the whole of the suburban system had been 34 to 35 per cent. He asserted that the Government had no intention of introducing electric traction, and complained that a recent vacancy on the Railway Commission was not filled by an electrical expert.

PENDING ELECTRICAL LAWSUITS

(*Strictly copyright.*)

THE lists for the Michaelmas sittings of the Law Courts which commenced yesterday contain a number of lawsuits of interest to the electrical industry, but the action regarding metal filament lamp patents has not yet been put down for hearing before Christmas as was expected.

Marples, Leach & Co. are appealing against the judgment of Mr. Justice Parker in March, in which it was decided that the Bergmann lamp infringed the Z Electric Lamp Manufacturing Co.'s patent for the use of "phospham" in incandescent lamps. There will also be a motion for the production of further evidence in this case.

Another decision of Mr. Justice Parker's is being appealed against, viz., that the Ilgner patent for flywheel storage is invalid. It was alleged by the owners of this patent, viz., the Donnersmarckhütte Oberschlesische Eisen und Kohlenwerke Actien Gesellschaft, that the Electric Construction Co. had infringed their patent in an installation for the electric driving of rolling mills at Messrs. Hickman's works, but the judge held that the patent was invalid for want of subject matter.

The only other appeal is by Messrs. Babcock & Wilcox, Ltd., against a decision by Mr. Justice Warrington that in using the name Harrison in connection with a furnace, Messrs. E. Danks & Co. (Oldbury), Ltd., did not imply that they were supplying the Harrison patent furnace usually sold by Messrs. Babcock & Wilcox.

In the Chancery Division there are two actions relating to wireless telegraphy, one of which is by the Marconi Co. against the British Radio-Telegraph & Telephone Co., Ltd., in respect of the equipment of the s.s. *Nonsuch* of Messrs. Bowles Bros., London, which it is alleged infringes three of the Marconi Co.'s patents. The other is the Amalgamated Radio-Telegraph Co. *v.* Gandill, there being an action and counterclaim. The case of the British Thomson-Houston Co., Ltd., *v.* Midland Railway Co. for alleged infringement of their patents covering the multiple unit control system for electric traction, which has been in the list for the last two sittings, does not now appear, it having been settled. We understand that under the terms of the settlement, the Midland Railway Co. will agree to judgment being given for the B.T.H. Co., and recognise the validity of that Company's patent. Among the other actions is Electric & Ordnance Accessories Co., Ltd., *v.* Hancock (action and counterclaim).

The action by Mr. W. Griffiths against the proprietors of the *Daily Chronicle* for libel arising out of articles on the G.B. surface-contact system in the Mile End Road, will be mentioned in the King's Bench Division early in the session. The action *Electrical Press, Ltd.*, v. Mountain for alleged fraudulent misrepresentation is still in the list. It will be remembered that the *Electrical Press, Ltd.*, as advertising agents, placed the prospectus of Messrs. Mountain, Gibson, & Thornewill, Ltd., and were the largest creditors in the subsequent liquidation of the company.

Another action, by Crompton & Co., against Morgan & Davis, is a claim for payment, but we believe there will be no necessity for the case to come into Court.

Other actions include Babcock & Wilcox *v.* Spearing, which relates to an agreement; Settle *v.* Sheerness & District Electric Power Co., which has reference to an indemnity; and Improved Electric Traction, Ltd., *v.* Chloride Electrical Storage, Ltd., for money paid, but the latter is of no great importance.

In the Divisional Court, the case of the British Westinghouse Co. *v.* the Underground Electric Railways Co. of London appears, and we may make a shrewd guess that it is in connection with the Lots Road turbines. Another case in this Court is by the National Electric Construction Co. against the Canterbury Corporation. This is an appeal against a judgment in the Kent County Court respecting a free-wiring agreement, it having been held that a Local Authority has no power under the Electric Lighting Acts alone to make such an agreement. The Canterbury Corporation work under an ordinary Provisional Order, and have no special wiring powers.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

DYNAMOS AND MOTORS.—We have received from Mawdsley's, Ltd. (Zone Works, Dursley, Glos.), a large and attractive showcard with illustrations of a Mawdsley high-speed generating set, a miniature motor-generator set, and a number of motors driving pumps, &c.

BATTERIES AND BOOSTERS.—A new pamphlet from the Chloride Electrical Storage Co. (Clifton Junction, Manchester) contains a reprint of an article describing an Entz booster installation at the Blackburn Electricity Works, with illustrations of the equipment, and diagrams showing the excellence of the regulation obtained.

THE CARE OF MOTORS AND DYNAMOS.—An illustrated booklet has been issued by the Union Electric Co., Ltd. (Park Street, Southwark, London), giving useful instructions for starting, cleaning, and maintaining direct-current motors and dynamos, with special reference to Union machines. These practical hints as to the care of commutators should be of particular assistance to users of motors.

WIRES AND CABLES.—A provisional catalogue of vulcanised india-rubber wires and cables just to hand from Messrs. Siemens Brothers & Co., Ltd. (Caxton House, Westminster) supersedes their main catalogue of V.I.R. cables issued March, 1907, and relates to both "association" and "non-association" cables.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

METAL FILAMENT LAMPS.—An attractive booklet is being issued by Messrs. Cryselco, Ltd., of Bedford, entitled "Light Notes on a Light Subject, by Chris Elco," and containing general notes on the manufacture of Cryselco metal filament lamps, with view of the Bedford Works, and a full price-list of both metal and carbon lamps they manufacture there.

TRANSMISSION LINE ACCESSORIES.—A pamphlet from Gebr. Hannemann et Cie, of Düren (Germany), contains particulars of several appliances for the construction and maintenance of overhead high-voltage lines. One of these is a convenient mirror mounted on a bamboo pole, with which insulators may be inspected without climbing the pole. Another device is a celluloid cap, which burns away on any arcing across an insulator, and thus shows immediately where the trouble has taken place. Special clips and tools for the attachment of line wires to insulators are also dealt with. As announced in our advertisement columns, the British patents for some of these appliances are for disposal.

HOLOPHANE FITTINGS.—The excellence of the well-known Holophane series of scientifically designed glass prismatic shades and reflectors is now generally recognised, and the new "Stiletto" form of prism has led to the introduction of some attractive diffusing and directing reflectors. New fittings are continually being brought out to utilise this glassware to its best advantage, and a number of these are contained in a catalogue just issued by Simplex Conduits, Ltd. (Garrison Street, Birmingham). A feature of some of these lies in the use of hollow rods through which the wires can be led out of sight, instead of ordinary chain for the suspension of the bowl and sphere fittings.

THE HAMPSTEAD ELECTRICAL EXHIBITION

A SUCCESSFUL exhibition of Domestic Electrical Appliances was held last week at the Hampstead Baths, under the auspices of the Electricity Department of the Hampstead Borough Council. Several wiring contractors in the district took part in it, as well as manufacturing firms and agents, and it is evident that there is a healthy co-operation between the electricity department and the wiring-firms towards increasing the popularity of electricity and the education of the consumer in its numerous applications. Great credit is due to Mr. Geo. H. Cottam and his Chief Assistant, Mr. E. Sayer, for the work they have done in this direction.

In Hampstead the extension of electric lighting into the smaller as well as the larger houses and shops is being actively encouraged, and it is not surprising, therefore, that the most prominent stand was that of Messrs. Siemens Bros. & Co., Ltd., and Siemens Bros. Dynamo Works, Ltd.,

Digitized by Google

and that a great feature of this stand was "Stannos" wiring. A well-designed showboard illustrated the system clearly, and the methods of fixing and jointing and patient attendants were there to explain all its details to visitors. Messrs. Siemens' stand was by no means confined to this exhibit, however, and an intersting collection of the firm's other specialities was shown, including a selection of useful and

FIG. 1.—THE SIEMENS STAND.

ornamental fittings. Among these we noticed a new type of outside lantern illustrated in Fig. 2. The novelty consists in the method of attachment of the glass globe, which is held in place by an ingenious device, so that the globe has only to be pushed up in position, and the use of set screws in the gallery is avoided. The device is shown in Fig. 2. A

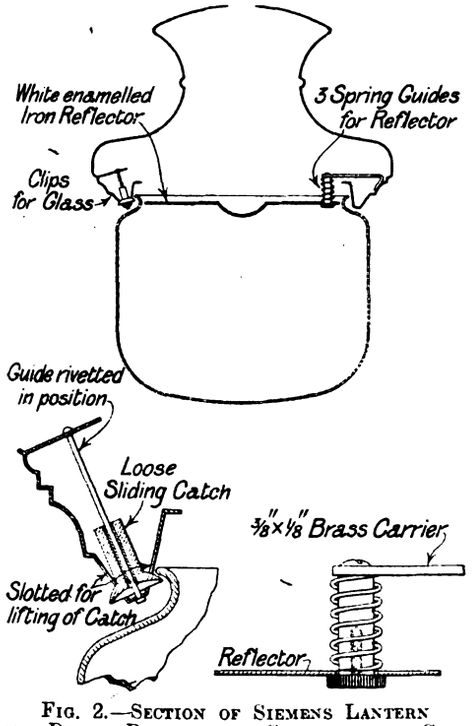

FIG. 2.—SECTION OF SIEMENS LANTERN AND DETAIL DRAWING OF GLOBE-CARRIER CLIP.

catch has only to be pushed up to allow the globe to be taken off, and on replacing the globe the catch is pressed back as the globe is pushed into position, and falls back again in the lip of the globe. As is seen in the illustration, the reflector from which the lamp is suspended is mounted on springs to prevent vibration, and although this may not be necessary with tantalum lamps, yet for other makes, at any rate, a vibration absorber is an advantage. Needless to say tantalum and "Onewatt" lamps are a feature of Messrs. Siemens' stand.

On a large number of stands electric heating and cooking appliances were very conspicuous. Messrs. Drake & Gorham, Ltd., showed Bastian heaters, Archer irons, and, among other things, an electrically-heated coffee percolator, in which a pint of black coffee could be brewed in a quarter of an hour, with the expenditure of one-sixteenth of a unit of electrical energy. Messrs. Spagnoletti, Ltd., exhibited their "Therol" system. An exhibit which attracted much attention was that of Messrs. Eastman & Warne, in conjunction with Eastman & Son, Ltd., dyers and cleaners. The various patterns of electric irons made by the former firm were shown in operation by skilled laundry hands, and some solid-looking electrically-heated soldering irons were shown. A 22 oz. iron is maintained hot with the consumption of 170 watts, and a 2½ lb. iron with 250 watts. The inclusion of the heating coil in the tool does not render it cumbrous to the slightest degree.

A new electric cooker just put on the market by Messrs. O. C. Hawkes & Co., Ltd., was to be seen at the stand of Mr. Eric Rivers-Smith. Several patterns were shown. In the one illustrated in Fig. 4 the central part is employed for grilling and roasting. This part is fitted with three 500-watt heating units (seen as white bars in the figure), which glow at a red heat. They are inserted in clips in a similar way to fuses, but are pressed tight in contact by set screws with milled heads. When a unit burns out it can be taken out in a few seconds, and Messrs. Hawkes will rewind it, or replace it, for 6d. A "Dutch oven" is placed on the shelf in front of the units for roasting, &c. At either side is a boiling plate, with a 500-watt heating unit fixed close under it.

Messrs. Purcell and Nobbs have some new designs of their electric heaters. Various sizes of the "electroyl" pattern were shown, in which the heating unit is contained in oil, and other patterns in which the oil is not employed. Among the latter was a "fresh-air heater" in which the air is led from the outside and passes across a nikelin and asbestos heating unit. The construction lends itself to easy fixing in the wall of a house or hall. "Tricity" cookers were also on view on a stand occupied by the Berry Construction Co., Ltd. Ozonair, Ltd., showed several sizes of ozonair ventilating apparatus emitting their characteristic pleasant smell; Messrs. Roper and Co. (the Kilburn "Bon Marché"), Ltd., a good show of Z lamps. Messrs. Duncan Watson and Co., and also Messrs. F. Troy and Co. showed portable vacuum cleaners in operation. The latter firm had two stands well filled with fittings and other interesting accessories, and we noticed the new Horvath 32 c.p. metal filament lamp (which we believe is the smallest of that candle power yet manufactured), in addition to a good selection of Osrams of various candle powers. The Adams Watkin lamp regulating switch was in evidence, and close

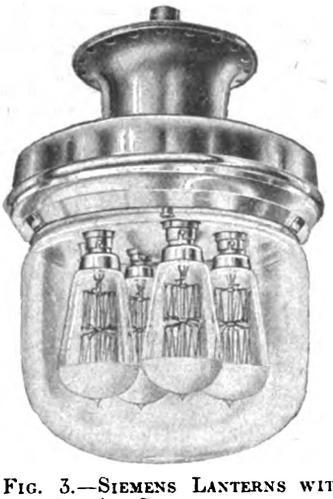

FIG. 3.—SIEMENS LANTERNS WITH SPECIAL GLOBE-CARRIER.

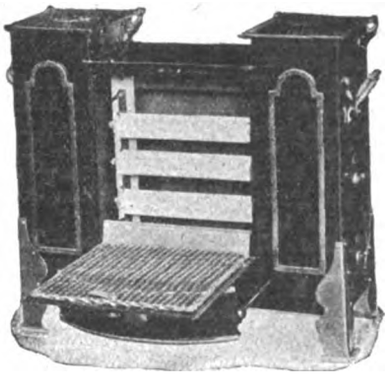

FIG. 4.—HAWKES' COOKER.

by were a collection of Aron clocks. Considerable attention was directed to a "Kaleidoscopic" sign shown by Messrs. W. Leonard and R. C. Jeboult, in which coloured lamps in box-like compartments and worked by independent thermal flashers give a pretty effect. Lastly, we must mention a new dinner lift shown by Mr. Fred. Hodgson. In this the arrangement of the gear is such that no cupboard is necessary for the lift at the dining-room end. The lift as it rises simply lifts a flap in the floor. If the mechanical details of this lift prove to be mechanically sound and durable, there should be a great future before it.

In addition to the exhibits already referred to, there was a good display of electrical fittings; Mr. William Smith particularly deserves honourable mention.

LOCAL NOTES

Acton: *Transfer of Electrical Undertaking.*—At a special meeting of the Acton District Council last week, it was agreed, by eleven votes to nine, to accept the terms of the Metropolitan Electric Supply Co., Ltd., for the handing over to them of the electricity undertaking. In addition to giving £2,500 and being responsible for the loan charges, the Company will pay a further £2,500 on their obtaining and paying a dividend of 6½ per cent., instead of giving £5,000 at the taking over the undertaking as the Acton Council requested. The Chairman of the Electricity Committee, H. S. Schultess Young, moved, and Councillor Page seconded, that the terms be accepted, and an amendment was proposed by Councillor Dunsmore, and seconded by Councillor Schulster, that they allow the negotiations to drop, and invite tenders for the erection of a new generating station of their own. The amendment was, however, lost and the original motion carried.

Amble: *Street Lighting.*—The Council have under consideration an offer by the local Electric Lighting Company for street lighting.

Barnsley: *Street Electric Lighting.*—The Borough Electrical Engineer has prepared a scheme of street electric lighting in substitution for gas, and the matter is to be discussed by the Council.

Brighton: *Price for Tramway Energy.*—The Manager of the Corporation tramway system has complained in several of his reports of the high price paid to the Electricity Committee for energy for tramway purposes. A joint sub-committee, drawn from the Lighting and General Purposes Committees, is now to determine the price to be paid for tramway energy during the current financial year.

Carlisle: *Electric Lighting.*—The Corporation are to be allowed to apply for an Electric Lighting Provisional Order for supplying portions of the Rural District.

Derby: *Electricity Accounts.*—There is a loss of £79 on the electricity undertaking for the last year, compared with a profit of £365 in the previous year. However, there is an item of £1,427 which has been expended upon items of a capital nature, but which appears in the revenue account.

Glasgow: *Tramway Profits.*—Meetings of protest are being held by the ratepayers against transferring any profits from the tramway undertaking to relief of rates. The argument is that these should be used for the benefit of the tramways department and travelling public, as was laid down by the Committee of Parliament which dealt with the Corporation Gas Bill last session. Mr. James Willock, a past convener of the Electricity Committee, is taking a prominent part in these protests.

Halifax: *Tramway Extensions.*—It is proposed to extend the tramways to Elland. The latter Council have appointed a Committee to go into the matter and report.

Hove: *Proposed Tramways.*—The Hove Ratepayers Association has expressed its strong disapproval of a proposal by the British Electric Traction Company to introduce tramways in the town.

Leith: *Electricity Charges.*—The general feeling of the Council is that the profits from the electricity undertaking should be conferred upon the consumers instead of distributed in relief of rates, and in order that in future large surpluses should not be shown, the Convener of the Committee has been instructed to reorganise the charges.

London: *Hammersmith: Electric Lighting.*—Notice has been given to the Brentford Gas Co., to discontinue the supply of gas for the lighting of Hammersmith Bridge, electricity having been substituted.

Paddington: Tramways.—The Council have refused their consent to the construction of tramways along Edgware Road, from Marble Arch to Cricklewood. Delegates have been appointed to meet the Highways Committee of the London County Council.

Newcastle: *Tramway Extensions.*—The Corporation propose to seek Parliamentary powers for the extension of the tramways from Scotswood to Blaydon, Newburn, and Westerhope.

New Zealand: *Electricity for Domestic Purposes.*—With a view to familiarising the general public in New Zealand with the numerous applications of electricity for domestic requirements, a series of demonstrations is being arranged for by the Wellington City Council. It is also stated that similar demonstrations are to be arranged in Christchurch.

Ottery: *Electric Supply.*—Lord Coleridge presided over a meeting last week to consider the promotion of an electric lighting company for the town. Mr. Steel, a consulting engineer of Exeter, proposes to make use of some local water power, and estimates the necessary capital at £2,000.

Portsmouth: *Tramway Assessment.*—The Assessment Committee some time ago increased the assessment of the Corporation Tramways from £15,534 to £23,510. Naturally the Tramways Committee appealed against this new assessment, and as the result of a meeting between the two committees, a figure of £19,000 has been agreed upon.

Rio de Janeiro: *Electric Supply.*—The Companhia Brazileira de Energia Electrica have obtained from the Mayor of the Federal district of Rio Janeiro the approval of their plans for giving an electric supply in the city. We understand that action is being taken in the Brazilian Courts by the Rio Janeiro Light and Power Company with regard to this matter.

Scarborough: *Stoppage of Tramways.*—The Corporation are very concerned at the action of the Tramways Company in suspending its service for the winter months. Representations are being made to the Board of Trade, and there is every probability of a conference taking place between the Tramways Committee and the Corporation on the matter.

South Africa: *Uitenhage: Electric Supply.*—The General Electric Co., of London, who formed a local company for the introduction of electric supply in Uitenhage, has completed the works, and current was switched on last month.

Tramways.—Two firms have the option for a period of six months of the right to construct tramways in Bloemfontein.

West Ham: *Electricity Accounts.*—The accounts of the Electricity Department for the year to March 31st show a deficit of £93. It should be pointed out, however, that by reason of the new assessment of the undertaking, rates have cost £5,207 more than in the previous year. The number of units sold, namely, 19,156,399, is an increase of 3,634,344, and the revenue has increased from £69,812 to £79,454. The working expenses were £48,813, against £39,123.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bispham.—The Borough Surveyor is preparing plans of a proposed power house in Redbank Road.

Darlington.—A loan of £1,400 has been sanctioned for condensing plant.

Felixstowe.—A loan of £3,000 for electrical extensions is to be applied for.

Horsham.—New generating plant is to be installed at an estimated cost of £1,850.

Ipswich.—Sanction for a loan of £6,007, which has been spent in anticipation of borrowing powers, is to be sought, in addition to a further £10,993 for mains, services, meters, hire-purchase wiring, motors, and arc lamps.

Kettering.—Additions to the street electric lighting are to be carried out. A coal-conveying plant is also to be installed.

London: *London County Council.*—An expenditure of £3,100 is to be incurred in linking up the two sets of sub-stations on either side of the river. Of this sum, £2,600 is for cables and the remaining £500 is for switchgear.

Hackney.—Mains are to be extended from Clapton Common to Springfield Gardens at an estimated cost of £255.

Islington.—The L.C.C. have sanctioned a loan of £4,251 for mains, transformers, house services and meters.

South Africa.—It is stated that the Rand Mines Power Supply Co., Ltd., have made an application for a licence to erect two generating stations, and the Victoria Falls & Transvaal Power Co. for a licence to supply electrical energy from six generating stations. Further particulars from the Board of Trade, 73 Basinghall Street, London.

South Shields.—An inquiry into a loan of £9,410 for electrical extensions was held last week. Mr. Vesey Knox, K.C., appeared on behalf of Messrs. Smith's Dock Co., and the North-Eastern Railway Co., whose rateable value in the borough amounts to £66,000. He explained that the object of his appearance was to see that the expenditure on the electricity

Digitized by Google

undertaking was controlled and managed in such a way as to produce the best result to the rates. In the course of the discussion it came out that the County of Durham Electric Power Co. are prepared to supply the Corporation with electricity in bulk upon terms which were said to be one-third the present generating costs of the Corporation, and eventually the inquiry was adjourned in order to see if the Corporation and the Power Company could come to an agreement.

Stockton-on-Tees.—The Electrical Engineer is preparing an estimate of possible extensions of plant.

Tonbridge.—An inquiry was held last week concerning a loan of £1,441, partly for service charges in substituting electricity for gas for street lighting. During the course of the inquiry, the Inspector, Mr. H. R. Hooper, expressed himself in his usual manner on this question, and further suggested that the cost of conversion should be charged to revenue and not to capital.

Wednesbury.—The Local Government Board have sanctioned, without holding an inquiry, a loan of £4,000 for extensions at the Electricity Works.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings.

GREATER LONDON.

Rebuilding of premises in Broadway, Hammersmith. Messrs. Sich and Co.

Two blocks of dwellings, Church Lane, Tooting.

Buildings on the southern side of Upper Clapton Road, Hackney.

Additions to Old Kent Road Special Schools, Bermondsey.

Additions to Hatfield Street School, Southwark.

Re-erection of Victoria Station (District Railway) buildings.

Eighteen houses at Hart Grove, Ealing. Architect, A. Dawkins, 31, Craven Street, Strand.—Eleven houses, Leyborne Avenue. J. Kaphan, 19 Ealing Road, South Ealing.—Nine houses and Institute, Meadvale Road. Ealing Tenants, Ltd., 32 Woodfield Crescent, Ealing.—Eighteen houses, York Road. A. J. Taylor, 22 Overdale Road, South Ealing.

Plans for 39 electric theatres are awaiting the approval of the London County Council.

Proposed alterations and extensions to Stratford Hospital.

Proposed new offices for Public Trustee in Kingsway.

PROVINCES.

Aberdeen.—Church, John Knox Parish.

Beckenham.—Elementary School in Witham Road.

Bexhill.—York Hall is to be wired for electric lighting.

Birmingham.—Fire Station in Moseley Road.—Also Art Gallery.

Bournemouth.—Science and Art School.

Bo'ness.—Nurses' Home. Mr. Dalziel, W.S., Edinburgh.

Bradford.—Additions to Guardians' premises.

Caterham.—New Council Offices.

Chatham.—Cottage Homes and Receiving Ward. Medway Guardians.

Cork.—Rebuilding of Munster and Leinster Bank. Architect, A. Hill, 22 Georges Street, Cork.

Darlington.—Fifteen houses in Harding Street, and twelve houses in Hollyhurst Road.

Derby.—New County Offices, St. Mary's Gate.

Dudley.—Women's Hostel at Training College. Architects, Messrs. Crouch, Butler & Savage, Birmingham.

Dundee.—Training College for St. Andrew's University. Electric theatre in Logie Street. D. Oppenheim. Electric theatre in Watson Street. John Spink.

Durham.—Several new schools and additions to existing schools are to be carried out. A. J. Dawson, Clerk, Education Committee, Shire Hall, Durham.

Eastleigh.—Theatre in Market Street.—Proposed Cottage Hospital.

Ebbw Vale.—Drill Hall for first Welsh Field Ambulance Corps.

Eccles.—Proposed school in Vane Street.

Esher.—Parish Hall in Church Street.

Farnworth.—Tenders are invited for the electric lighting of the Carnegie Library. Architect, W. J. Lomax, 11 Fold Street, Bolton.

Gateshead.—Additional buildings for the Guardians.

Gosport.—Addition of three class rooms to Grove Road School.

Grantham.—Proposed extension of Messrs. Hornsby's Works.

Grays (Essex).—School in Bridge Road.

Hinckley.—Isolation Hospital.

Horsham.—Proposed Public Baths.

Inverness.—New police premises.

King's Lynn.—School in Paxton Terrace.

Leeds.—Alterations to large block of buildings, junction of Little Queen Street and Wellington Street. Architects, Thomas Winn & Sons, 84 Albion Street.

Liverpool.—New court, Dale Street, and alteration to public buildings.

Manchester.—Schools in Gibbon Street and Clarendon Road. Education Committee, Deansgate.—Labour Exchange. H.M. Office of Works, Manchester.—Church for St. Andrews, Droylsden, and Clayton districts. Ecclesiastical Commissioners.

Merthyr Tydfil.—New block at Workhouse Infirmary. Architect, T. Roderick, Clifton Street.

Motherwell.—Hall in Camp Street.

Mountain Ash.—Working Men's Club. Architects, Messrs. Morgan & Elford, 1 Jeffrey Street.

Paisley.—Additions to factory. Messrs. Eadie Bros. & Co.

Salford.—Extension to Infirmary.

Stanley.—Girls' school. Durham Education Committee.

Swansea.—103 houses on the Cwm Estate.

Torquay.—Electric lighting of Princess Pier and gardens.

Tunbridge Wells.—Electric theatre in Camden Road.

Watford.—New Grammar School for Boys in Rickmansworth Road.—Children's Home in Ashby Road.

Weston-super-Mare.—Church school in Milton Road.

West Riding (Yorks).—Proposed Sanatorium. County Council.

Whitehaven.—Council School in Irish Street.

Winchester.—New Council School.

Yeovil.—Elementary School in Kiddles Lane.

York.—Considerable additions at the Workhouse.

MISCELLANEOUS

Australia.—Tenders are invited by the Deputy-Postmaster-General at Melbourne by November 22nd for 95 miles of telephone cable, 358,800 paper sleeves, and 3,840 telephones, and by November 29th for telephone instruments. Particulars from 73 Basinghall Street, London.

London: *London County Council.*—The Council have at present four electrically-driven watering cars fitted with grinding gear for removing rail corrugations. Owing to the appearance of corrugations along routes opened since these cars were ordered, they are inadequate for the purpose, and four additional cars are to be obtained.

Frodingham.—It has been decided to light the streets by electricity, current being purchased from the Frodingham Iron & Steel Co.

West Ham.—Tenders are invited by October 20th for 12 double-deck electric tramcars, 12 maximum traction trucks, and 12 complete electrical equipments, including magnetic track brakes. Further particulars from the Manager.

Electricity Supply in Bethnal Green.—The agreement between the Bethnal Green and Shoreditch Borough Councils, under which the latter are to afford a supply of electricity in bulk to Bethnal Green, has now been prepared, and has been submitted to the London County Council for their comment. The Highways Committee call the attention of the Board of Trade to one or two points in the agreement. They do not think the penalties in the case of failure in supply are quite clear; they also suggest the necessity for a percentage loss in the distributing mains in Bethnal Green being inserted in the agreement. The accuracy of the meter measuring the bulk supply, if challenged, is to be referred to the Chief Electrical Engineer of the London County Council, but the Council prefer that the Electric Inspector, appointed under the Shoreditch Electric Lighting Provisional Order, should be the person. The agreement also provides that the consumer's meters in Bethnal Green, which are to be read by Shoreditch, should be of a type approved by the Shoreditch Electrical Engineer, but the Highways Committee fail to see any good reason for this. A most important point raised is that the agreement is for seven years from March 31st, 1911, but no provision is made for any extension of it, and as the County Council will have to lend the money for the works in Bethnal Green on a 20 or 30 years period of repayment, it is suggested that the term of the agreement should more nearly approximate to this, or, at any rate, that renewal should be made possible. A number of other minor points are also discussed. From the engineering point of view no exception is taken, and from the point of view of the future development in the supply of electricity in London, the Highways Committee sees an advantage in it by reason of the fact that it obviates the establishment of another small generating station.

Digitized by Google

TENDERS RECEIVED AND ACCEPTED

Hull.—The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., for a 900-kw. generating set, at £5,573, has been accepted.

London; *London County Council.*—The tender of Messrs. Stanley Bros., Ltd., for 440,000 stoneware cable ducts at £9 per 1,000, less 2½ per cent., has been accepted. The tender of Messrs. Patman & Fotheringham, Ltd., at £7,193 has been accepted for the erection of the second portion of the Bow car shed. The tender of the Edison & Swan United Electric Light Co., Ltd., at £138 13s. has been accepted for the electric wiring and fitting. The General Electric Co., Ltd., and Messrs. Pinching & Walton also tendered at £148 9s. and £151 15s. respectively. The following tenders were received for the wiring and fitting of the second section of the Central Car Repair Depôt :—Central Motor Engineering Co., £1,571; E. Lawrance & Sons, Ltd. (accepted), £1,702 17s.; G. E. Taylor & Co., £1,863 19s.; Johnson & Phillips, Ltd., £1,877; Tilley Brothers, £1,888 12s.; E. Newbald & Co., £2,024; Pinching & Walton, £2,035 10s; G. Weston & Sons, £2,043 12s.; Gordon O. Lawson, £2,320: Barlow Brothers & Co., £2,425 16s.

The tender of Messrs. Johnson & Phillips, Ltd., at £2,185, has been accepted for covering with asbestos tape various high and low tension cables used in connection with the tramways. The following tenders were also received :—Messrs. Siemens Bros. & Co., Ltd., £2,280; Western Electric Co., Ltd., £2,310; British Insulated & Helsby Cables, Ltd., £2,524; and W. T. Henley's Telegraph Works Co., Ltd., £2,905 16s.

The tender of the Phœnix Aktien-Gesellschaft für Bergbau und Hüttenbetrieb, Duisburg-Ruhrort, Germany, has been accepted for the supply of 4,800 steel tyres for driving wheels, at £4,080, and that of Messrs. John Batt & Co., Ltd., for 1,600 pony wheel tyres at £1,013 6s. 8d.

Hackney.—The following tenders have been received for the extension of the main switchboard at the electricity works :—Walsall Electrical Co., £249 10s.; Ferranti, Ltd., £715; Spagnoletti, Ltd., £340; Drake & Gorham, £353; British Thomson-Houston Co., Ltd., £525; Bertram Thomas, £339 10s.; Electric & Ordnance Accessories Co., Ltd., £305; Kelvin & White, £900; British Westinghouse Co., £786; Johnson & Phillips, Ltd., £422. The tender of Messrs. Spagnoletti, Ltd., is recommended for acceptance.

Manchester.—The Manchester Corporation Electricity Department have placed an order with the British Insulated & Helsby Cables Ltd., for some 8,000 yards of paper-insulated aluminium conductor cable, of equivalent section to 1 sq. in. copper.

South Africa.—Messrs. C. A. Parsons and Co. have received an order from the Durban Municipality for two 2,000 kw. turbo-alternators.

APPOINTMENTS AND PERSONAL NOTES

The following appointments have been made by the Stoke-on-Trent Corporation :—As Resident Electrical Engineers : Mr. H. W. Edwards, Burslem District; Mr. W. Adams, Hanley District; Mr. C. Cuthbertson, Longton District; Mr. W. A. Turnbull, Stoke District. As Mains Superintendents : Mr. H. C. Heath, for Burslem; Mr. S. G. Marston, for Hanley; Mr. C. H. Thomas, for Stoke.

Mr. H. Bedson, Meter Superintendent of the old Hanley Electricity Department, has been appointed, out of eighty candidates, Mains Superintendent to the Maidenhead Electricity Department.

Mr. A. G. Whyte (editor of our contemporary, *Electrical Industries*) is the author of a new novel entitled "The Templeton Tradition," which has just been published by Messrs. Blackwood & Son. The leading characters are partners in an engine-building firm, and the relations of master and man are developed in a novel manner.

The salary of Mr. C. A. Blascheck, Borough Electrical Engineer at Canterbury, has been increased from £325 to £350 per annum, and that of Mr. Lewis, Assistant Engineer, from three guineas per week to £185 per annum.

Agents are wanted for the sale of artificial Trinidad Lake bitumen. (See an advertisement on another page.)

A London electric supply company have a vacancy for an improver with mechanical and electrical training. (See an advertisement on another page.)

An experienced draughtsman is required for power station machinery and pipe lay-out work. (See an advertisement on another page.)

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. George Smith & Son, of 5 Philpot Lane, London, E.C., inform us that the price of electrolytic wire bars, net c.i.f. port of arrival, quoted on Tuesday night, was £58 15s. to £59 per ton (last week, £58 to £58 5s.).

Change of Address.—Messrs. Simplex Conduits, Ltd., have now removed their motor department from 116 Charing Cross Road to Garrison Lane, Birmingham, where Mr. Wahl, the manager of this department, will in future have his offices and all testing will be carried out.

Owing to increase in their business, the Sloan Electric Co., Ltd., will shortly be removing to "Conradty House," 12 Golden Lane, E.C. The trade will, in the course of a few weeks, be notified by circular of the exact date of removal.

Dissolution of Partnership.—J. H. Woodhead and H. Woodhead, electrical engineers and contractors, Gascoigne Street, Leeds, have dissolved partnership.

Bankruptcies.—The public examination of F. Peacock, electrician, 59 North Station Road, Colchester, was completed last week. The statement of affairs shows £228 owing to thirty-two creditors, with no assets.

Creditors of the Polesworth Electrical Appliances, Ltd., are requested to send in claims to Mr. H. Hackett, 36 Carrs Street, Birmingham, not later than November 12th.

Electricity in Business.—Messrs. Electrical Installations, Ltd., 27 Martin's Lane, Cannon Street, inform us that they are equipping a large stand at the forthcoming Business and Advertising Exhibition at Olympia (October 13th to 22nd), in order to demonstrate the many ways in which electricity can conduce to economy in business.

Metallic Packing.—We are informed by the United States Metallic Packing Co., Ltd., Soho Works, Thornton Road, Bradford, that the main engines, electric light engines and pumping engines of the new White Star liner *Olympic*, shortly to be launched from Messrs. Harland and Wolff's yard, will be provided with United States metallic packing made at Bradford.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Calcutta Tramways Co.—Interim dividend of 2s. 6d. per share.

Calcutta Electric Supply Corporation.—Interim dividend at the rate of 7 per cent. per annum for the June half-year.

United Electric Tramways Co. of Montevideo.—The receipts for the first half of this Company's current year show an increase of £25,100 over those of the corresponding six months of last year.

Norwich Electric Tramways Co.—For the year to June 30th there was a net profit of £6,107. Reserve is credited with £2,500, and a dividend of 1¼ per cent. paid, carrying forward £307. The number of passengers increased by 617,511.

Mexico Tramways Co.—Dividend at the rate of 7 per cent. for September quarter.

City of Birmingham Tramways Co.—Interim dividend at the rate of 10 per cent. per annum for nine months to September 30th.

New St. Helens & District Tramways Co.—Dividend of 1½ per cent. on account of preference arrears.

Cleveland & Durham Electric Power Co.—The accounts for the past year, which show a profit of £12,942 compared with £2,098 for the previous year, were adopted at the annual meeting on Friday. Mr. J. Falconar, the Chairman of the Company, said that the main capital expenditure had now been completed, and that the increase in profits was sufficient evidence of the manner in which the Company's undertaking was now expanding.

Willans & Robinson.—At the half-yearly meeting on Tuesday Mr. J. C. Peach, while regretting the loss of £8,001 during the past six months, expressed the opinion that there were signs that the worst had been reached in the matter of low prices, and that given staying powers, the Board would overcome the difficulties created by this condition of affairs. One obvious cure for the excessive competition in the electrical industry was amalgamation, a policy which had been adopted with success in many other industries. The directors were ready to take advantage of any reasonable opportunity of this character that might present itself, but it was a policy that could not be forced.

SUMMARY

WE publish this week a series of articles particularly dedicated to the electric light consumer and prospective consumer, and dealing with shop and shop-window lighting. They commence with some notes on the general arrangement of shop lighting installations, the number and position of lamps required, and illustrations of some suitable shades and reflectors are given. Shop-window lighting is next dealt with in a separate article, and the relative merits of various methods of arranging lamps are discussed, several forms of reflector for effective concealed lighting are illustrated, and this form of illumination is recommended as preferable in a great number of cases to lighting by lamps hung on visible pendants, &c. The use of arc lamps is also considered, and a few notes are given on decorative lighting. A number of forms of lantern for exterior shop lighting are illustrated, and the general question of lighting shop fronts from outside, both by incandescent lamps and by arc lamps, is dealt with. A few figures as to the cost of arc lighting are given. A more technical article follows, giving detailed descriptions of the various electric signs. These range from the simple box sign for window advertising, consisting of a sheet-metal box with painted glass fronts and a thermal flasher controlling a single lamp, to the enormous writing and colour-changing signs erected on the outside of buildings. The latter are controlled by ingenious motor-driven switches, some types of which are described and illustrated. Various means are adopted to give clear and brilliant effects without producing an unpleasant glare. The exterior signs must also be water-tight and durable. Finally we give tables showing the cost of lighting by metal filament lamps. (Pages 657–665.)

A NOVEL application of the Telewriter consists in placing a receiver in a shop window and causing it to write advertisement notices, general news items, in view of the public. The concealed operator may also cause it to address remarks to lookers-on. (Page 665.)

A NEW locking device for bayonet lamp-holders has been introduced. It can be attached to existing holders, the only alteration required being a slot in the liner of the holder. (Page 665.)

AMONG the Specifications published by the Patent Office on Thursday was one by A. C. Heap for a transformer starter for A.-C. motors, in which the inductive relationship of the primary and secondary windings can be varied to obtain a gradual increase of the applied pressure. The transformer is cut out automatically when the full voltage is reached.—An apparatus for producing a compact mica casing round the sides of former-wound armature coils is described by M. Meirowsky.—G. A. Kohler covers an A.-C. solenoid for automatic switchgear with a short-circuited winding on the core.—A patent covering the use of auxiliary metallic contacts in circuit-breakers for taking the current after the main contacts are opened but before the arcing contacts are parted, expires during the current week.—Two patents of interest to electrical mining engineers also expire after the full life of fourteen years. (Page 666.)

AN interesting engineering and machinery exhibition is being held at Manchester. (Page 667.)

A PORTABLE ventilating set recently introduced consists of a small centrifugal blower direct-coupled to a D.C. motor, the whole being light enough to carry about. It can be placed on the window-sill for blowing air in or out of a room. (Page 667.)

A PROMINENT stand at the Business Exhibition at Olympia demonstrates the latest methods of electric lighting, heating, ventilating, and telephones suitable for business premises. (Page 667.)

A LETTER in our correspondence column calls attention to the attitude of certain towns with regard to the proposed Municipal Wiring Bill, and a correspondent writes regarding the manufacture and sale of Diesel engines. (Page 668.)

Digitized by Google

An illustration is given of a railway station lighting installation where metal filament lamps are used exclusively. (Page 668.)

Applications for space are now invited for the Electrical Exhibition which will be held at Olympia (London) from September 23rd to October 21st, 1911. (Page 669.)

The wireless telegraph equipment of the Wellman airship has been a complete success, although the vessel herself did not prove equal to the Transatlantic voyage. It is due entirely to wireless telegraphy that the crew were rescued. (Page 669.)

The National Electrical Manufacturers' Association have altered their articles of association with a view to confining the management more completely to British manufacturers. (Page 669.)

Messrs. Marples, Leach & Co., as agents for Messrs. Bergmann (Berlin), appealed on Friday against the judgment of Mr. Justice Parker that by the use of phospham in the manufacture of their lamps, they infringed one of the patents of the "Z" Electric Lamp Manufacturing Co. After an argument lasting three days, to the effect that although phospham was used in the manufacture of the Bergmann lamps, it was used for a different purpose to that of the "Z" Co., the court dismissed the appeal without calling on counsel for the "Z" Co. to reply. (Page 669.)

In the King's Bench Division of the High Court on Thursday, the action of Griffiths *v.* Lloyd and others, which related to the experimental installation of the G.B. surface contact system in the Mile End Road, was announced as having been settled. The proprietors of the *Daily Chronicle*, the *Star*, and the *Morning Leader* have apologised to the owners of the G.B. surface contact system for statements made in their papers which were held to be libels. They have also agreed to pay a substantial sum as damages. (Page 669.)

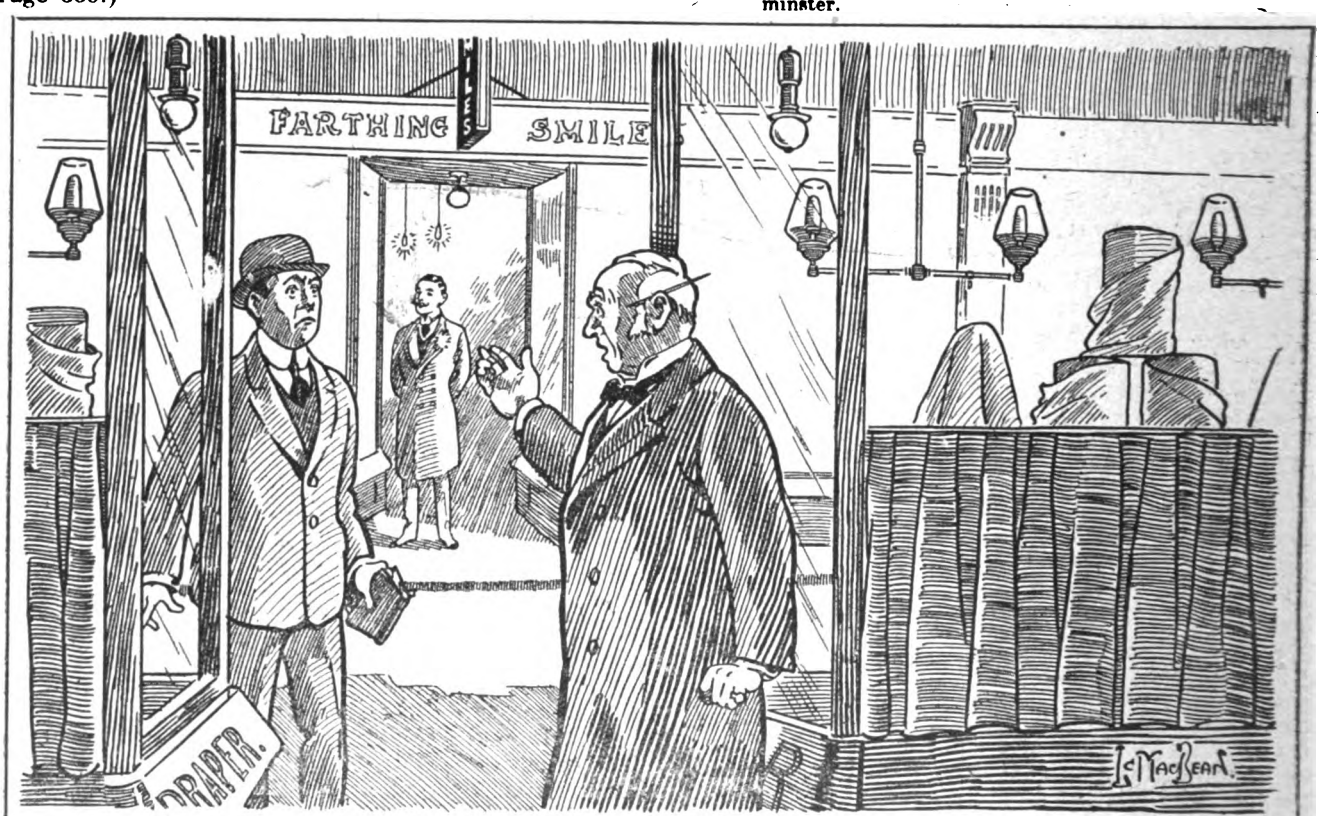
The second portion of the Birmingham Corporation power station, making a total capacity of 19,000 kw., has been completed.—A competing electric supply company is being promoted in Buenos Aires.—Considerable sums are being saved at Burton-on-Trent and Croydon by the use of meters on tramcars.—The Dundee Town Council have not approved of municipal wiring powers, and the Cheltenham Council have decided to hear objections from local contractors.—Meetings are being held protesting against the Dolter contact-system in Hastings.—The reconstruction of the Torquay Dolter tramways is being put in hand.—Flame arc lamps are being installed experimentally for street lighting in Calcutta. (Page 671.)

Extensions of electricity works are proposed at Wednesbury (£4,600); Yarmouth (£5,800); Oldham (£12,544); Battersea (£9,000); Carlisle (£12,645); and Bury St. Edmunds (£1,430). Extensions are also contemplated at Swindon, Beckenham, and Ayr. Electrical stores are required by the Dublin United Tramways Co. and the London County Council; a complete tramway system is required in New Zealand, and six tramcars at Rawtenstall. (Page 672.)

It is proposed to reduce the capital of the Cleveland & Durham Electric Power Co. from £1,000,000 to £700,000. Dividends at the rate of 10 per cent. per annum are declared by Callender's Cable & Construction Co., 7½ per cent. by Stothert & Pitt, and 4 per cent. by Drake & Gorham. (Page 674.)

ARRANGEMENTS FOR THE WEEK

FRIDAY, OCTOBER 21st.



Electro Harmonic Society.

8 p.m. Smoking Concert at Holborn Restaurant (King's Hall).

TUESDAY, OCTOBER 25th.

Junior Institution of Engineers.

7.30 p.m. Second Lecture on "Law Relating to Engineering," by L. W. J. Costello, at Caxton Hall, Westminster.

WHAT THE ELECTRIC LIGHT CANVASSER HAS TO PUT UP WITH.

Irate Shopkeeper: It's no use your talking to *me*, young man. I'm not going to believe electricity is cheaper than gas because *you* say so, and I like your impudence talking of what I spend in redecorations; it's *me* not *you* as pays for 'em. And let me tell you that the air of *my* establishment is not vitiated by gas or anything else, and that *my* stock does not fade or get dirty. You can go back to your master, young man, and tell him that he needn't send you here again nor his silly postcards and tracts. But you may tell your master that as Farthings and Smiles opposite have taken away half my customers with their foolish electric light, he can put it up here too.

Digitized by Google

ELECTRIC LIGHTING OF SHOPS AND SHOP WINDOWS

THE present article reviews the question of lighting shops and shop windows from the point of view of the consumer or prospective consumer. It may be taken for granted that every tradesman will consider electric light to be the most desirable method of illumination, and therefore he will doubtless welcome some general information as to the best manner to arrange his installation, an indication of the cost of lighting, the best methods to be employed for shop-window and shop-front lighting, the various types of electric signs, and other matters of a similar nature. We trust, therefore, that the following pages will be useful to those who are considering what is the best, most economical, cleanest, and safest method of lighting their shops, as well as to those who are contemplating alterations or extensions of their existing lighting arrangements.

The first point to be considered is the number, size, and position of the lamps in the shop itself, and in laying out his scheme the consumer will be greatly assisted by knowing that, as the electric lamps have no open flame, and give off comparatively little heat, he can place his lamps practically where and how he likes. Moreover, he is not so hampered as he would have been a few years ago on the question of cost, for an inspection of the tables on a later page will show that with the new metallic filament lamps the cost of the electricity consumed is extremely small. These tables give the cost of current per 100 hours for lamps of various sizes, so that a fairly accurate estimate may be made in advance.

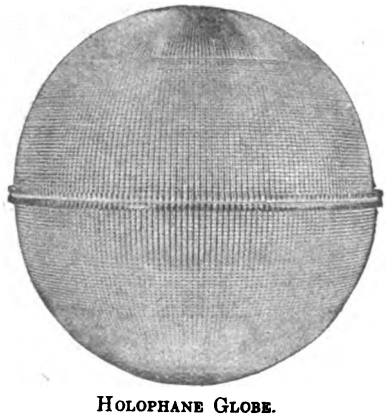
The interior arrangement of shops is so varied that it is not possible to give a hard and fast rule as to the amount of light required. As a rough and ready rule, one candle-power for every 2 sq. ft. of floor surface is a good average to take for good bright illumination. If the goods sold are chiefly white or of a light colour, and the shop has a white ceiling, considerably less light than this will be found sufficient for most purposes, especially if it is possible to distribute the lamps evenly. On the other hand, if the colours are dark, or if the lamps have to be hung very high, an increase in light is necessary. In shops of a medium size, it is a good plan to arrange the lamps on this basis initially, using, say, the 55-watt or 100-watt lamps given in the tables on p. 665, and to replace these by smaller or larger lamps if it is found that the illumination is too bright or insufficient. An advantage of electric light is that a lamp may be changed for a smaller or larger one in a minute.

In rooms with counters it will probably be found best in most cases to hang the lamps in lines above the centre of the counters, and not between them. Generally a height of about 7 ft. 6 in. will be found suitable, but in a high room it will be found necessary to suspend the lamps at a greater height, and the same applies if a few lamps of high candle-power are used rather than several lamps of lower candle-power, as a "patchy" light must be avoided at all costs. It must not be forgotten, also, that if the shop windows are very brightly lighted, or if an intense light is employed outside for show purposes, the interior of the shop must also be more brightly lighted than would otherwise be the case, and the lamps should be placed fairly high up, as the more even distribution of light which ensues has a pleasant effect on the customer entering the shop.

We will not devote much space to the choice of fittings, as the consumer will prefer to be guided by his individual taste. In nine shops out of ten, however, the plain "pendant" is the most suitable, for with these there is a large scope for choice in the selection of shades. In shops where coloured goods are sold, coloured shades will usually be best avoided, but there are an extremely large number of sizes and shapes of white, "opal," fluted, crinkled, and frosted glass shades to choose from. It should be borne in mind that, as a general rule, the larger the diameter of the shade, the better is the distribution of the light. The "holophane" shade has the property of distributing the light uniformly. It is made in a number of forms, both as shades open at the bottom, and as globes and bowls, and by the selection of a suitable pattern the light can be concentrated or diffused in accordance with almost any requirements. The globes are generally constructed with a series of horizontal prisms on their outer surface for redirecting the light rays, and a series of internal prisms, which give perfect diffusion. The reflectors are constructed upon an entirely different principle. The outer surface is substantially covered with total or double reflecting prisms calculated to reflect the light rays back through the body of the glass and out of the open mouth of the reflector. Quite recently a new pattern, known as the "stiletto" form has been brought out. This is superior in appearance to the older patterns, and quite as effective in directing the light. They are made in three varieties, as shown in the illustrations overleaf, the blocks for which were kindly lent us by Messrs. Drake and Gorham, Ltd. (66 Victoria Street, S.W.). The following particulars as to spacing these reflectors will be found of use. The "Extensive" shades should be placed at a distance apart equal to twice their height above the plane of illumination. The "Intensive" type reflectors should be placed at a distance apart equal to 1½ times their height above the plane of illumination. The "Focussing" type reflectors should be spaced apart equal to their height above the plane of illumination.

"Counterweight" (up and down) pendants should only be employed when they are absolutely necessary, as they conduce to the "patchy" illumination which, as we have already pointed out, should be avoided. When they are indispensable, however, the consumer is advised to insist on the counterweight having a large pulley, and it may be pointed out also that there are some patterns of "ceiling rose" particularly designed to prevent the cord from coming off the pulley at the top.

We must qualify our recommendation of plain pendants by warning the consumer that he should insist on his wiring contractor employing flexible cord of the best quality. It is immaterial whether he uses silk-covered or cotton-covered cord, but whichever he selects, it is false economy to employ any other quality than the best.



The consumer, in planning his installation, should not forget that one of the advantages of electric light is that the switch need not necessarily be close to the lamp it controls, and he should therefore himself decide the most convenient position for the switches, and not leave it to the wireman to put them up where he likes. If switches are grouped, Lundberg's "twinob" switch (which is virtually two switches under one cover) will be found convenient in reducing the space taken up, and incidentally its use saves

SPECIAL NOTICE.—*Central Station Engineers and Managers, and Wiring Contractors, who desire to obtain supplies of this issue for distribution among consumers and prospective consumers, should place their orders at once either with their newsagents, or with the Kilowatt Publishing Co., Ltd., Temple Chambers, London, E.C., who will forward parcels of 240 copies and upwards carriage paid (smaller quantities 1½d. each post free.)*

expense, as it costs less both to supply and fix than two single switches.

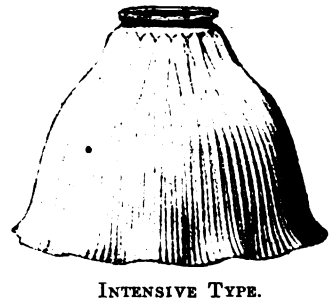
In the choice of lamps, preference should be given to metal filament lamps, a number of makes of which are mentioned in the article on p. 664. Carbon filament lamps of 5 and 8 candle-power may be used in cupboards and small rooms where much light is not required. The 8 c.p. carbon-filament lamp consumes the same amount of electricity as the 32-watt metal

Holophane Globe.

Holophane Bowl Distributing Reflector.

filament lamp, which gives about three times the candle-power, but the lamp itself costs less.

The question of the cost of wiring has still to be mentioned. We are loth to give any general estimate of the cost, and recommend consumers to obtain estimates from local wiring firms of good repute, who can examine the premises and quote the exact prices for which they will be prepared to carry out the work. The cost can vary from 5s. per lamp up to 25s. or 30s., according to the system employed, the size and character of the building, &c. In new buildings of an important, substantial, and permanent character, in which the wiring is to be concealed, solid-drawn pipes with screwed joints are placed in the walls and floors under the plaster, floor-boards, or concrete during erection, and the wires are drawn into them after the plastering and flooring is completed. The next best work is with tubes having a welded or brazed seam instead of being solid drawn. Wires in wooden casing make a good job in dry buildings and when the casing may be fixed on the surface and under floor-boards, but casing concealed in the walls is not recommended for new buildings. For ordinary shop lighting, what is known as the bonded slip joint conduit system is an inexpensive method of tube wiring, which answers very well for surface work, and wiring with twin lead-covered, rubber-insulated wire is an inexpensive method which is satisfactory if carefully laid with the wires placed out of reach of possible injury or properly protected on the surface of walls. Lastly we may mention the "Stannos" system of wiring, in which the insulated wire is tightly surrounded by a tinned copper tube. This has come much into favour recently, especially for surface work, and makes a neat, sound, and safe job if properly carried out. In obtaining quotations for work, wiring contractors should be asked to give alternative tenders for different systems, explaining the suitability of each for the particular premises.



SHOP WINDOW LIGHTING

THERE are, broadly speaking, three methods by which the illumination of shop windows may be effected, namely:—(1) By means of more or less elaborate pendant fittings or brackets, carrying lamps with or without shades at a moderate height within the window—too frequently with the lamps in full view of the passer-by. (2) Entirely by lamps in lanterns outside of, and in front of, the window; and (3) By concealed lamps aided by reflectors. This classification is intended to apply to incandescent lighting, which is, of course, now practically entirely carried out by metal filament lamps, but in many cases, as we shall see below, arc lamps can be used with good results, both inside and outside the windows.

The first method is the old-fashioned system, and as compared with the others, it has certain disadvantages. It must be always borne in mind that the primary object of shop-window lighting is to illuminate the goods displayed, rather than to direct attention to the source of light. Lamps of too great brightness visible to the onlooker will cause an unpleasant glare in the eye, which will prevent him seeing the goods in comfort, and in a similar way the use of very elaborate fittings will call attention away from the goods. As usually carried out, this method involves the use of a good deal of flexible wire, which has some disadvantages. There are, however, numerous cases where the system is useful in windows of small or moderate size, either alone or in combination with the other methods, but it is important that shades be used to shield the excess of light from the onlooker, and at the same time to direct the light downward on to the goods, also that fittings only of the simplest character be employed. Excellent reflecting shades for the purpose are those known as Holophane glassware, of which we have already given some particulars. For the kind of shop-window lighting we are considering, the "concentrating" and not the "distributing" shades should be used, and when the lamps are fairly high, and goods are low down, it is surprising how good an effect can be produced by their aid with only a few lamps of moderate size.

method is much to be preferred; with the lamps entirely outside in suitable lanterns. For a shallow window, with goods arranged all the way up, a brilliant and even illumination is very easily obtained, and the larger sized metal filament lamps lend themselves admirably to the purpose. We deal more fully with this method of lighting on pp. 660–2, under the heading of "Shop Front Lighting."

The third method, that of "concealed lighting," is for many classes of goods by far the most effective, and of late years manufacturers have vied with one another in the production of suitable reflectors and systems of mounting lamps for the purpose. A very large amount of light can be used without any danger of dazzling the eyes of the onlooker, because the lamps are hidden, and if the system is carried out in its entirety, so are the fittings themselves. Rows of lamps can be employed, giving very even distribution of light. The light can come from the top, bottom, sides, or all round, or can be concentrated upon particular goods which it is desired to illuminate with special brightness. In the case of jewellery, and to a less extent with silver and with glass, light coming from a great number of hidden points produces a sparkle and brilliancy otherwise unobtainable. A good effect can be obtained in some classes of window by lighting entirely from the top, in which case reflectors of the types shown in Fig. 1 may be employed. Some of these are for fixing up, either on brackets or hung from chains, inside the top of the window, out of sight, and others for standing on the glass top when the window is in the form of a closed show case. For bottom lighting, which, however, is usually insufficient by itself, reflectors of some such form as that shown in Fig. 2 may be employed, or any other of the very numerous patterns of long box reflectors adapted for ordinary sizes of metal filament lamps. For side lighting it is usually essential that the reflectors should be very narrow if they are to be hidden, and considerable ingenuity has been exercised in the design of reflectors of this class. The pioneers of lighting by rows of narrow lamps concealed in trough reflectors were the Linolite Co., whose "Tubolite" system employs tubular lamps with longitudinal filaments placed end to end in a narrow aluminium trough reflector of carefully designed curve, giving more even distribution of light than do those where rows of ordinary lamps are employed. There are, however, now a vast number of linear reflectors on the market, suitable for metal filament lamps, under various names. A convenient reflector intended for the narrow "Olive" pattern of Osram lamp is shown in Fig. 3. The lamp carriers can be conveniently swung out of the way for cleaning the reflectors. Another form, which is convenient owing to the angle of the reflector being adjustable while the position of the lamp is fixed, is shown in Fig. 5 in two sizes. Very numerous other designs are made, some with the lamps in separate compartments, and others employing specially narrow tubular lamps in holders, secured by clips in troughs varying in width down to about 1¼ in. Another narrow form with special tubular lamps is shown in Fig. 6. Most of the exceptionally narrow strip reflectors employ carbon lamps. Curved strip reflectors can also be obtained. The methods of wiring are also very numerous, but that is a matter which need not be gone into here. Reflectors for single lamps and for fixing temporarily on to shelves are shown in Fig. 4. This class
